ISSUED: December 21, 2025

18th INTERNATIONAL CONFERENCE ON ENGINEERING & NATURAL SCIENCES

EVALUATION PROCESS and POLICIES

All applications have undergone double blind peer review process. In addition, each paper was accepted and the process of publishing in the book was carried out through editorial oversight. The published papers were presented and discussed at the meeting.

Full texts and abstracts published in accordance with the Symposium Policy have been prepared in accordance with ethical rules and APA standards. Authors of all papers are both ethically and legally responsible.

PARTICIPANTS COUNTRIES

Türkiye, Albania, Algeria, Azerbaijan, Bangladesh, Bulgaria, Ethiopia, Georgia, India, Indonesia, Iran, Kazakhstan, Malaysia, Morocco, Nigeria, Pakistan, Philippines, Saudi Arabia, Slovenia, Sri Lanka, Uganda, Ukraine

TOTAL ACCEPTED ARTICLES: 306

The Number of Accepted Papers from Türkiye: 179
The Number of Accepted Full Papers from Other Countries: 214
The Number of Total Papers: 393

18th INTERNATIONAL CONFERENCE ON ENGINEERING & NATURAL SCIENCES

ORGANIZING BOARD

Prof. Dr. Mustafa Harmankaya (Konya Selçuk Üniversitesi Ziraat Fakültesi, Türkiye)

Prof. Dr. Mehmet Fırat Baran (Siirt Üniersitesi, Ziraat Fakültesi, Türkiye)

Dr. Öğr. Üyesi Yeter Çilesiz (Sivas Bilim Ve Teknoloji Üniversitesi, Tarım Bilimleri Ve Teknoloji Fakültesi, Türkiye)

Dr. Öğr. Üyesi Hatice Bekci (Kayseri Üniversitesi, Develi Hüseyin Şahin Meslek Yüksekokulu, Türkiye)

Dr. G. Rajalakshmı (Hindusthan College Of Arts & Science, Coimbatore, Tamilnadu, Indıa)

Dr. Gustavo Brunetto (Federal University Of Santa Maria. Santa Maria, Brazıl)

Dr. Muhammed Faızan (A Central University, Indıa)

Dr. Ristina Siti Sundari (University Of Perjuangan Tasikmalaya, Faculty Of Agriculture, Wezt Jawa, Indonesıa)

Dr. Zubair Aslam (University Of Agriculture, Department Of Agronomy, Faisalabad, Pakistan)

Dr. Sami Ur Rehman (Department Of Engineering For Innovation, University Of Salento, Lecce, Italy)

18th INTERNATIONAL CONFERENCE ON ENGINEERING & NATURAL SCIENCES

SCIENCE AND ADVISORY BOARD

Prof. Dr. Hakan Özkan (Çukurova Üniversitesi)

Prof. Dr. Faruk Toklu (Çukurova Üniversitesi)

Prof. Dr. Nafiz Çeliktaş (Hatay Mustafa Kemal Üniversitesi)

Prof. Dr. Fatih Seyis (Recep Tayyip Erdoğan Üniversitesi)

Prof. Dr. Yusuf Yanar (Tokat Gaziosmanpaşa Üniversitesi)

Prof. Dr. Disna Ratnasekera (University of Ruhuna)

Prof. Dr. Hirofumi Saneoka (University of Hiroshima)

Prof. Dr. Marian Brestic (Slovak University of Agriculture)

Prof. Dr. M. Shohidul Islam (Hajee Mohammad Danesh Science and Technology University)

Prof. Dr. Oksana Sytar (Taras Shevchenko National University of Kyiv)

Assoc. Prof. Dr. Sina Besharat (University of Urmia)

Dr. Adnan Akhter (University of Punjab)

Dr. Alfonso Cuesta Marcos (Bayer Crop Science)

Dr. Akbar Hossaın (Bangladesh Wheat And Maize Research Institute)

Dr. Adnan Akhter (University of Punjab)

Dr. Elza Bitsadze (Akaki Tsereteli State University)

18th INTERNATIONAL CONFERENCE ON ENGINEERING & NATURAL SCIENCES

November 27-29, 2025 / Kyrenia, TRNC

CONGRESS PROGRAM

Online (with Video Conference) Presentation

Meeting ID: 929 9691 8209 / Passcode: 272829

https://zoom.us/j/92996918209?pwd=zglIR6LH5JbLaMUMAHOHvAIEfxmRx1.1

IMPORTANT, PLEASE READ CAREFULLY

- To be able to make a meeting online, login via https://zoom.us/join site, enter ID instead of "Meeting ID or Personal Link Name" and solidify the session.
- The Zoom application is free and no need to create an account.
- The Zoom application can be used without registration.
- The application works on tablets, phones and PCs.
- Moderator - responsible for the presentation and scientific discussion (question-answer) section of the session.

Points to Take into Consideration - TECHNICAL INFORMATION

- Make sure your computer has a microphone and is working.
- You should be able to use screen sharing feature in Zoom.
- Attendance certificates will be sent to you as pdf at the end of the congress.
- Requests such as change of place and time will not be taken into consideration in the congress program.
- **(All speakers required to be connected to the session 15 min before the session starts)**
- Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.
- **Before you login to Zoom please indicate your name_surname and HALL number, exp. Hall 1, Gülen**

-Opening Ceremony-

Kyrenia Local Time: 09:30-09:50
Veue: The Olive Tree Hotel Meeting Room

***

Dr. Öğr. Üyesi Yeter ÇİLESİZ
(Sivas Science and Technology University)
CONFERENCE COORDINATOR

***

Prof. Dr. Tolga KARAKÖY
(Sivas Science and Technology University)
CONFERENCE CO-CHAIR

***

Prof. Dr. Ercan CEYHAN
(Konya Selçuk University)
CONFERENCE CO-CHAIR

-Coffee Break-

Kyrenia Local Time: 09:50-10:00

28.11.2025
Kyrenia Local Time: 10:00-12:00

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

IN-PERSON SESSION

Veue: The Olive Tree Hotel
HALL-1

MODERATOR: Hatice BEKCİ

AUTHOR	AFFILITION	ABSTRACT TITLE
Yeşim Sağlam Özkan Yeliz Kara Ali Berkan Bektaş	*Bursa Uludağ University*	On Neighborhood-Based Topological Indices In Quantitative Structure–Activity Relationship Analysis Of Some Fda-Approved Anticancer Agents
Chukwudi Gracious Maduka	*Cyprus International University*	Lightweight Machine Learning For Ddos Attack Detection In Resource-Constrained Smart Home Environments: A Hybrid Approach Using Feature Selection And Comparative Model Analysis
İrem Küçükoğlu Niyazi Ugur Kockal	*Alanya Alaaddin Keykubat University*	An Approach On The Distributed Load Deflection Of A Defined Material By Using Hermite Polynomials
Niyazi Ugur Kockal Alp Cesur	*Akdeniz Üniversitesi*	Effect Of Gamma Rays Applied To Polymer Modified Mortars On Physico-Mechanical Properties
Suha Orçun Mert Ali Ayazseven	*İskenderun Teknik University*	Comparison Of Discharge Analysis Of Supercapacitor And Lithium Polymer Batteries Under Constant Load In Terms Of Efficiency
Aslı Kaçar Zekiye Erdoğan Gökhan Erdoğan Baran Aslan Aylin Kabaş Ibrahim Çelik Selman Uluışık	*Akdeniz University*	Assessment Of Tetranychus Urticae Tolerance In Tomato Lines Derived From Solanum PennellII (LA0716)
Ayşen Bulancak Mikail Baylan	*Cyprus International University*	The Effects Of Climate Change On Poultry Production And Solutions
Yasemin Gümüştaş Mikail Baylan Aziz Gül	*Çukurova University*	Determination Of Lithium Chloride Residue Levels In Honey Used For The Control Of Varroa Destructor In Honeybees (Apis Mellifera)
Hatice Bekci	*Kayseri University*	Biological Activities Of Vinegars
Tolga Karaköy Ömer Sözen Yeter Çilesiz	*Sivas University Of Science And Technology*	Assessment Of Morphological Adaptation Traits Of Selected Bread Wheat Genotypes Under Changing Climatic Conditions In Sivas

28.11.2025
Kyrenia Local Time: 10:00-12:00

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

IN-PERSON SESSION

Veue: The Olive Tree Hotel
HALL-2

MODERATOR: Yeliz KARA

AUTHOR	AFFILITION	ABSTRACT TITLE
Yeliz Kara Yeşim Sağlam Özkan Ali Berkan Bektaş	*Bursa Uludağ University*	Qspr Analysis Of Anticancer Compounds Using Neighborhood Sombor And Related Topological Indices
Ali Keleş	*Yüzüncü Yıl University*	Some Edible Macrofungi Detected In Van Yüzüncü Yıl University Campus And Surrounding Area (Van, Turkey)
Mehmet Arif Saltan Alperen Aykun Volkan Soylu Doğukan Korucu Melih Turan Sevindik Mustafa Bekir Acar	*National Defence University*	Investigation Of The Combustion Efficiency Of A Natural Gas-Hydrogen Mixture In A Combustion Chamber Using Computational Fluid Dynamics
Muhammet Ali Gündeşli Murat Manav	*Kahramanmaraş İstiklal University*	Active Compound Losses And Alterations In Drug Preparation From Medicinal Plants: Causes And Prevention Strategies
Muhammet Ali Gündeşli	*Kahramanmaraş İstiklal University*	Quality Control Parameters And Standards In The Drug Preparation Process Of Medicinal Plants
Nurten Yılmaz Fatih Özoğul	*Cukurova University*	Postbiotic Organic Acids Produced By Food- And Seafood-Isolated Lab Strains: Chemistry, Functional Roles, And Health Implications
Elif Dağgeçen Çoskun Nurten Yılmaz Uğur Zülkadir Erdal Kuşvuran	*Cukurova University*	Antibiotic Resistance In Seafood-Derived Probiotic Strains: Mechanisms, Prevalence, And Safety Implications
Sertan Denizli Ezgi Yılmaz Göç	*Brisa Bridgestone Sabancı Tyre Manufacturing And Trading Inc.*	Optimization Of Lead Lug Ratio For Enhanced Traction And Wear Performance In Agricultural Vehicles
Oğuzhan Uygurlu Ezgi Yılmaz Göç	*Brisa Bridgestone Sabancı Tyre Manufacturing And Trading Inc.*	Relationship Of Rrc-Temperature-Speed On Truck And Bus Tires (22.5 Sizes)
Suat Vardar Turgut Tüzün Onay	*Boğaziçi University*	Investigation Of Microplastic Presence In Tap Waters In Istanbul
Emine Balı Selda Uzal Seyfi	*Selçuk University*	Evaluation Of General Characteristics Of Greenhouse Enterprises In Central Districts Of Adana Province
Yasemin Kocaman Selda Uzal Seyfi	*Selçuk University*	Contruction Of A Carbon Emission Density Map For Layer Hens Farms In Konya Province And Its Districts Via The Tier 1 Methodology

ONLINE SESSIONS

27.11.2025
Kyrenia Local Time: 09:00-11:00
Ankara Local Time: 10:00-12:00

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.
Before you login to Zoom please indicate your name_surname and hall number,
exp. Hall 1, Samet Kuşkıran

SESSION-1, HALL-1 / OTURUM-1, SALON-1

MODERATOR: Fatma Yıldız

Meeting ID: 929 9691 8209
Passcode: 272829

AUTHOR	AFFILITION	ABSTRACT TITLE
Mine Kılıç Birsel Demirel Gül Eda Kılınç	*Ondokuz Mayıs University*	The Role Of Phase Angle In Nutritional Status Assessment
Perihan Kızılkaya Birsel Demirel Gül Eda Kılınç	*Ondokuz Mayıs University*	Irritable Bowel Syndrome And Nutrition: Evidence-Based Approaches From Diagnosis To Treatment
Gizem Yılmaz Semra Alkan Türkuçar	*Alanya Alaaddin Keykubat University*	Investigation Of Cytotoxic And Apoptotic Effects Of Alchemilla Caucasica Buser Extracts On Human Mcf-7 Cell Line
Fatma Yıldız	*Alanya Alaaddin Keykubat University*	Neuroprotective Effect Of A Novel Benzimidazolium Derivative: An Approach Through Dnmt-Mediated Epigenetic Regulation
Şebnem Kuşvuran Fathia Mohamed Ali	*Çankırı Karatekin University*	Effects Of Nano-Silicon On Germination And Seedling Development Of Melon Genotypes Under Salt Stress
Şebnem Kuşvuran Fathia Mohamed Ali	*Çankırı Karatekin University*	Effects Of Nano-Silicon Applications On Growth, Yield, And Fruit Quality In Tomato (Solanum Lycopersicum L.) Under Salt Stress Conditions

27.11.2025
Kyrenia Local Time: 09:00-11:00
Ankara Local Time: 10:00-12:00

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.
Before you login to Zoom please indicate your name_surname and hall number,
exp. Hall 1, Samet Kuşkıran

SESSION-1, HALL-2 / OTURUM-1, SALON-2

MODERATOR: Sena Yaşar

Meeting ID: 929 9691 8209
Passcode: 272829

AUTHOR	AFFILITION	ABSTRACT TITLE
Muhammet Melih Memiş	*Çankırı Karatekin University*	Turbocharger System Radial Compressor Impeller Design
Ali Umut Şen	*Izmir Institute Of Technology*	Advanced Kinetic Modeling Of Bark Pyrolysis Using Distributed Activation Energy Models
Mert Ökten	*Manisa Celal Bayar University*	Integrated Assessment Of Photovoltaic, Reverse Osmosis, And Seawater Heat Pump Systems In The Context Of Energy And Water Sustainability: A Case Study For The Turkish Republic Of Northern Cyprus
Filiz Senyuzluler Adil Baykasoglu	*Dokuz Eylül University*	Toward An Uncertainty-Tolerant Electric Vehicle Recommendation System Via Weighted Axiomatic Design
Sena Yaşar Yusuf Özçatalbaş	*Gazi University*	Failures And Prevention Methods In Welded Joints Of Construction Machinery
Güven Nergiz K. Turgut Gürsel	*Dokuz Eylül University*	Coastal And Offshore Wind Turbine Types And Modelling
Oğuzhan Yılmaz K. Turgut Gürsel	*Dokuz Eylül University*	Analysis Of High-Speed Planning Boat Forms In Terms Of Step Design

27.11.2025
Kyrenia Local Time: 09:00-11:00
Ankara Local Time: 10:00-12:00

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.
Before you login to Zoom please indicate your name_surname and hall number,
exp. Hall 1, Samet Kuşkıran

SESSION-1, HALL-3 / OTURUM-1, SALON-3

MODERATOR: Mokesh Velraj

Meeting ID: 929 9691 8209
Passcode: 272829

AUTHOR	AFFILITION	ABSTRACT TITLE
Laila Ouardi Hasna Zinelabidine Abdelmajid Haddioui Hassane Boudad Abdelghani Bouchyoua Jamal Charafi	*University Of Sultan Moulay Slimane*	Cold Stress Responses In Grapevine: Comparative Morphophysiological And Biochemical Traits Of Three Cultivars
Sadiq M.S. Singh I.P. Ahmad M.M. Sani B.S.	*Federal University Dutse*	Digitalization And The New Semiotics Of Branding
Mokesh Velraj	*R.M.K. Engineering College*	Intelligent Solar Power Forecasting Using Hybrid Cnn-Lstm Architecture: An Iot-Enabled Embedded Systems Approach
R. Devadharshini W. Helen	*Bharath Institute Of Higher Education And Research*	Artificial Organs And 3d Bioprinting
Masudul Islam Khan Shajmin Akter	*Daffodil International University*	Mechanisms and Therapeutic Applications of the Antifungal Activity of Tea Tree Oil: A Comprehensive Review
Bilal Shah Dicky Muslim Raden Irvan Sophian	*Universitas Padjadjaran*	Geomechanics Of Andesitic Rock Units In The Gunung Geulis Area, Sumedang Regency, Indonesia
Mohamed Kadour Atouailaa Bader Boukili Arif Ahmed Abdelkhalk Aboulouard Mustapha Boulghalat Mohammed El Idrissi	*Sultan Moulay Slimane University*	Surveying Novel Pyrazine Acceptor Materials For Bulk Heterojunction Solar Cells: Computational Insights Into Photovoltaic Performance
Umma Nourin Sawon Nahidul Islam Hasan Samrat Hasibul Islam Shishir Al-Amin Sarker Jannatul Ferdoushi	*Iubat—International University Of Business Agriculture And Technology*	Predicting Air Quality: Machine Learning (Ml) Models For Pm2.5 Concentrations In Delhi, India

27.11.2025
Kyrenia Local Time: 09:00-11:00
Ankara Local Time: 10:00-12:00

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

Yeter Çilesiz Seyithan Seydoşoğlu	*Sivas University of Science and Technology*	Omics-Based Analysis of Abiotic and Biotic Stress Responses and Multilayer Network Models in Lens culinaris
Yeter Çilesiz	*Sivas University of Science and Technology*	Targeted Gene Editing in Plant Breeding Using Crispr–Cas9

29.11.2025
Kyrenia Local Time: 11:30-13:30
Ankara Local Time: 12:30-14:30

(All speakers required to be connected to the session 15 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.
Before you login to Zoom please indicate your name_surname and hall number,
exp. Hall 1, Samet Kuşkıran

SESSION-2, HALL-2 / OTURUM-2, SALON-2

MODERATOR: Buse Apaydin

Meeting ID: 929 9691 8209
Passcode: 272829

AUTHOR	AFFILITION	ABSTRACT TITLE
Nur Kılınç Mehmet Kılınç	*Giresun University*	Dyeing Of Biomordanted Fabrics With Microwave Energy And Analysis Of Color Properties
Yunus Kaya	*Bursa Technical University*	Design And Modeling Of Next-Generation Grinding Aids And Investigation Of Their Effects
Yunus Kaya	*Bursa Technical University*	Experimental And Theoretical Investigation Of The Ftir And Nmr Spectra Of The Ester Molecule Obtained From The Synthesis Of Acetic Acid And Tipa
Gaye Özata Inyayla Şule Ocak Araz	*Kırıkkale University*	Effect Of Fillers Reinforced In Polyamide-6 Matrix On Thermal Conductivity
Ilgın Ayazgün Yusuf Özçatalbaş	*Gazi University*	Investigation Of Sintering And Alloying Behavior Of Prealloy + Premixed Alumix 123 Powder
Buse Apaydın Yusuf Özçatalbaş	*Gazi University*	The Effect Of Compaction Pressure And Sintering Temperatures On The Mechanical Properties Of Tm Parts Produced With Pre-Alloyed And Mixed Alumix 123 Powder
Tayfun Gül Özkan Coruk	*Kocaeli University*	Deterministic And Probabilistic Analysis Of Wedge Sliding Potential In Rock Slopes
Melekber Sülüşoğlu Durul	*Kocaeli University*	Sterilization Strategies In Tissue Culture Of Berry Fruits
Melekber Sülüşoğlu Durul	*Kocaeli University*	Factors Influencing Rooting Success In Quince (*Cydonia oblonga*) Cuttings

ABSTRACT

Cancer, one of today's most significant health issues, is a disease caused by uncontrolled cell proliferation. Early diagnosis, appropriate treatment approaches, and new-generation research play a vital role in the fight against cancer. A study of drugs used to treat cancer has sparked interest, especially through the use of topological indices based on molecular properties. A deeper understanding of these properties is crucial for drug development. topological indices help bridge the gap between the chemical and pharmaceutical industries by offering an affordable way to determine the molecular properties. This study examines some FDA-approved drugs used to treat cancer, one of the most prevalent diseases worldwide. Quantitative structure activity relationship analysis is performed to determine the relationship between indices and drug properties like heavy atom count, exact mass, molar refractivity, complexity, and polarizability. The study considers the neighborhood geometric-arithmetic index, neighborhood Randic index, neighborhood reverse Randic index, neighborhood atom-bond connectivity index, neighborhood nirmala index, neighborhood reduced reciprocal Randic index, and neighborhood inverse sum indeg index. The topological indices applied to these drugs are found to correlate well with physicochemical properties. This study clarifies the relationship between molecular structure and physicochemical properties by comparing them to evaluate the effectiveness of indices, and emphasizes the application of linear regression models to effectively predict these properties.

Key Words: Linear QSPR model, Drugs, Chemical graphs, Degree-based topological indices.

LIGHTWEIGHT MACHINE LEARNING FOR DDOS ATTACK DETECTION IN RESOURCE-CONSTRAINED SMART HOME ENVIRONMENTS: A HYBRID APPROACH USING FEATURE SELECTION AND COMPARATIVE MODEL ANALYSIS

Chukwudi Gracious Maduka
Information Technology, Cyprus International University, Northern Cyprus
Email: chukwudi.maduka@gmail.com
ORCID: 0009-0009-2709-4258

ABSTRACT

This study presents a lightweight machine learning framework for detecting Distributed Denial of Service (DDoS) attacks in highly resource-constrained smart home IoT devices (80–200 MHz CPUs, 32–128 KB RAM). By combining simulation and physical test bed validation, the proposed hybrid approach leverages feature selection and algorithm optimization to minimize overhead while maintaining detection efficacy. A seven-feature subset achieved 94.6% of the full model's accuracy with a 76.4% reduction in computational load. Three optimized classifiers—Decision Tree (1.37 KB, 94.8% accuracy), Random Forest (6.82 KB, 96.3%), and Naïve Bayes (0.92 KB, 91.7%)—were developed using techniques like fixed-point arithmetic, information gain-based tree construction, and early termination logic. The distributed architecture reduces device-level processing by up to 78% with sub-100ms detection latency. Experiments show high accuracy against volumetric attacks (>95%) and strong performance against application-layer attacks (>80%), with low battery impact (5–13%). This work demonstrates that hardware constraints in smart homes can be effectively addressed through tailored ML design, enabling practical security solutions.

Keywords: DDoS attack detection, resource-constrained environments, lightweight machine learning, smart home security.

ABSTRACT

In Turkey, the two-spotted spiders mites (*Tetranychus urticae* Koch) is a serious and economically important pest on vegetables, fruits, and field crops cultivate both in open fields and greenhouses. Commercial tomato varieties (*Solanum lycopersicum* L.) exhibit pronounced susceptibility to this pest. An increase in the population of *T. urticae* can alter the morphological appearance of tomato leaves and fruits, resulting in economic losses. Insecticides are employed to this pest, however the extensive application of these pesticides has facilitated the development of resistance among *T. urticae* populations. Therefore, the idendification of resistant plant lines is essential for effective control of *T. urticae* in tomato cultivation. In the previous step of the study, the free-choice method was used to determine the plants preferred and not preferred by *T. urticae* in the F2 populations obtained from the cross between the tolerant species *S. pennellii* (LA0716) and the susceptible AK2082 (*S. lycopersicum*). In this

method, 200 female adult mites were placed in the center of the tray, equidistant from all plants, using a brush. Their orientation was observed simultaneously among 208 83F2 plants. Subsequently, leaves were collected from all plants, and spiders' preference was determined using an olfactometer, and spiders numbers were calculated. Finally, the trichomes were counted. Morphological findings from the three stages suggest that plants with short stature, narrow leaves, and high hairiness may be resistant to *Tetranychus urticae*. DNA samples were taken from each *S. pennellii* (LA0716) × *S. lycopersicum* (AK2082) plant and transferred to the greenhouse for further examination.

Keywords: Two spotted spiders mites, tomato, resistance

ÖZET

Bu çalışmanın amacı Türkiye arıcılığına en büyük zararı veren varroa paraziti üzerine etkili lityum klorür maddesinin iki farklı dozda (10 ve 25 mM) ve üç farklı metod (fondan şeker, şeker spreyleme ve şerbetleme) ile saha koşullarında uygulanması sonucu elde edilen ballarda lityum kalıntı seviyelerinin tespit edilmesidir. Bu çalışmada toplam 70 arılı kovan kullanılarak lityum klorürün 10 ve 25 mM konsantrasyonları; 10 mM lityum klorür fondan şeker ile, 25 mM lityum klorür fondan şeker ile, 10 mM lityum klorür şerbet spreyleme (pulvarize) ile, 25 mM lityum klorür şerbet spreyleme (pulvarize) ile, 10 mM lityum klorür şerbetleme ile, 25 mM lityum klorür şerbetleme ile olacak şekilde toplamda üç farklı uygulama yapılmıştır. Bu çalışmada uygulama sonrası alınan bal örneklerinde yapılan analizler sonucu lityum klorür ortalamaları 10 mM lityum klorür fondan şeker 22,22 mg/kg, 25 mM lityum klorür fondan şeker 58,285 mg/kg, 10 mM lityum klorür şerbet spreyleme (pulvarize) 16,255 mg/kg, 25 mM lityum klorür şerbet spreyleme (pulvarize) 37,01 mg/kg, 10 mM lityum klorür şerbetleme 13,424 mg/kg, 25 mM lityum klorür şerbetleme 52,965 mg/kg olarak tespit edilmiştir.

Anahtar Kelimeler: Bal, Bal Arısı, Lityum Klorür

DETERMINATION OF LITHIUM CHLORIDE RESIDUE LEVELS IN HONEY USED FOR THE CONTROL OF VARROA DESTRUCTOR IN HONEYBEES (APIS MELLIFERA)

ABSTRACT

The aim of this study is to determine the lithium residue levels in honey obtained as a result of the application of lithium chloride, which is effective against the varroa parasite that causes the greatest damage to beekeeping in Turkey, at two different doses (10 and 25 mM) and with three different methods (fondant sugar, sugar spraying and syruping) under field conditions. In this study, a total of three different applications were made using 70 beehives and 10 and 25 mM concentrations of lithium chloride; 10 mM lithium chloride with fondant sugar, 25 mM lithium chloride with fondant sugar, 10 mM lithium chloride syrup spraying (pulverized), 25 mM lithium chloride syrup spraying (pulverized), 10 mM lithium chloride syrup, and 25 mM lithium chloride syrup. In this study, as a result of the analysis made on honey samples taken after the application, the average lithium chloride levels were determined as 10 mM lithium chloride fondant sugar 22.22 mg/kg, 25 mM lithium chloride fondant sugar 58.285 mg/kg, 10 mM lithium chloride syrup spraying (pulverized) 16.255 mg/kg, 25 mM lithium chloride syrup spraying (pulverized) 37.01 mg/kg, 10 mM lithium chloride syrup 13.424 mg/kg, 25 mM lithium chloride syrup 52.965 mg/kg.

Keywords: Honey, Honeybee, Lithium Chloride

QSPR ANALYSIS OF ANTICANCER COMPOUNDS USING NEIGHBORHOOD SOMBOR AND RELATED TOPOLOGICAL INDICES

ABSTRACT

Cancer is a significant global health problem, which necessitates the development of effective therapeutic agents and reliable computational approaches for predicting their properties. In this regard, mathematical and graph-theoretical tools have gained importance in drug design and development, offering efficient ways to model and predict the behavior of complex molecular structures. Topological indices (TIs), defined as numerical descriptors derived from molecular graphs, are widely employed to characterize chemical systems and to investigate the physicochemical properties and biological activities of pharmaceutical agents. As experimental determination of these properties is costly and resource-intensive, TIs provide a mathematical alternative that effectively bridges the fields of chemistry and mathematics. This renders them valuable tools in the realm of drug design and development. In this study, a range of anticancer drugs are analyzed using quantitative structure–activity relationship (QSPR) methods. The objective of this study is to establish mathematical relationships between topological indices and key physicochemical properties. The properties investigated included polar surface area, complexity, molar volume, molecular weight, and polarizability. The findings indicate the presence of robust correlations, particularly for indices based on neighborhood degree, which demonstrate a high degree of predictive capability. Moreover, a comparison between calculated and experimental values emphasizes the efficacy of the applied indices. This study will provide a comprehensive overview of the relevant literature on the subject.

Key Words: Cancer, Graph Theory, Topological Indices, QSPR.

SOME EDIBLE MACROFUNGI DETECTED IN VAN YUZUNCU YIL UNIVERSITY CAMPUS AND SURROUNDING AREA (VAN, TURKEY)

Ali KELEŞ
Yüzüncü Yıl University, Faculty of Education, OFMAE Department, 65080, Van, TURKEY
E-mail: alikeles61@yahoo.com

ABSTRACT

Mushrooms are highly important for health as they have low calorie in addition to ingredients such as high protein, vitamin and nutrients. Of all the food, they are among the best vegetables and animal protein sources. The present study is aimed to contribute the mycobiota of Turkey as well as to raise the public awareness of the region about edible. Moreover, fungus can be handled as an alternative nutrient to lack of food for growing population of the world. The material of the study consists of macrofungal samples collected within the borders of Van Yuzuncu Yil University Campus and Surrounding Area between 2023-2025. The morphological and ethnomycological characteristics of macrofungi were determined and recorded. Their photographs were also taken in their natural environments and substrates. After the microscopic characteristics of the macrofungi taken to the laboratory were determined, the materials were identified according to the data obtained. As a result of the study, 39 edible macrofungus taxa belonging to Agaricomycetes and Pezizomycetes classes were determined.

Keywords: Macrofungi, Edible, Van, Turkey.

Acknowledgment: The author would like to thank Van Yüzüncü Yıl University Research Fund for supporting the project (FYL-2024-11273).

OPTIMIZATION OF LEAD LUG RATIO FOR ENHANCED TRACTION AND WEAR PERFORMANCE IN AGRICULTURAL VEHICLES

Sertan Denizli
Brisa Bridgestone Sabancı Tyre Manufacturing and Trading Inc., 41310 Kocaeli, Türkiye
Email: s.denizli@brisa.com.tr
Ezgi Yılmaz Göç
Brisa Bridgestone Sabancı Tyre Manufacturing and Trading Inc., 41310 Kocaeli, Türkiye

ABSTRACT

The efficient operation of agricultural vehicles depends not only on engine power but also on how effectively that power is transmitted to the ground. In this context, the Lead/Lug ratio defined as the rotational lead of the front wheels relative to the rear wheels is a critical parameter, especially in tractors equipped with MFWD (Mechanical Front Wheel Drive) systems. This ratio directly affects traction performance, fuel consumption, transmission lifespan, and soil health. In MFWD tractors, the front wheels are typically smaller in diameter than the rear wheels. The Lead/Lug ratio plays a vital role in optimizing power transfer, fuel efficiency, and tire longevity. Therefore, a specific lead ratio is required to ensure synchronized rotation between the front and rear wheels [1, 2]. This study investigates the effect of the Lead/Lug ratio on traction efficiency and wear performance in agricultural vehicles equipped with MFWD systems. Based on factory-level testing, the rolling circumferences of tires under static and dynamic loads were measured, allowing for theoretical calculation of rotational ratios. The results indicate that a lead ratio between 1% and 5% provides the best balance between traction gain and minimal wear. According to finite element analysis and semi-empirical modeling confirms that proper lead settings can improve traction by up to 12% [2]. As a conclusion, the data-driven framework for integrating Lead/Lug optimization into tire design and tractor configuration strategies.

Keywords: Agricultural vehicles, Lead/Lug ratio, MFWD systems, Rolling circumference, Tire optimization

RELATIONSHIP OF RRC-TEMPERATURE-SPEED ON TRUCK AND BUS TIRES (22.5 SIZES)

Brisa Bridgestone Sabancı Tyre Manufacturing and Trading Inc., 41310 Kocaeli, Türkiye

ABSTRACT

Rolling Resistance Coefficient (RRC) is a critical parameter in terms of tire energy efficiency, performance, and environmental impact. This study quantitatively investigates the relationship between RRC, temperature, and speed in Truck and Bus-22.5 sized commercial vehicle tires through indoor tests conducted in accordance with the ISO 28580 standard. Under constant load (85% LI) and nominal inflation pressure, measurements were taken on 16 different tires at speeds of 30, 50, and 80 km/h. The temperature differences between the beginning and end of the tests (ΔT) and the corresponding RRC values were analyzed. The results reveal that RRC does not exhibit a linear relationship with temperature or speed. Notably, the lowest average RRC value observed at 50 km/h indicates an optimal operating point where viscoelastic energy losses and convective cooling effects are balanced. As speed increases, internal temperature rises, but this increase does not always lead to a reduction in RRC. The slope (β) of the ΔT–RRC curves varies with speed regime, indicating that tire viscoelasticity is influenced jointly by temperature and frequency (speed). By modeling the temperature–RRC relationship not with a single fixed slope but with speed-band-specific sensitivities, the study offers meaningful predictions in the context of field-relevant speed profiles and thermal transition processes. These findings suggest that failure to jointly evaluate tire thermal state and operational speeds in regulatory simulations such as VECTO may result in deviations in fuel consumption estimates. Furthermore, the 50 km/h speed band is highlighted as having the highest potential for gains in energy efficiency and sustainable transportation strategies.

Keywords: Rolling resistance, temperature, speed, commercial vehicle tire, thermoviscoelasticity, ΔT, β_v.

INVESTIGATION OF MICROPLASTIC PRESENCE IN TAP WATERS IN ISTANBUL

ABSTRACT

Microplastics, due to their unique physicochemical properties, demonstrate high resistance to environmental degradation and have emerged as pervasive micro-pollutants worldwide. While numerous studies have investigated the presence of microplastics in drinking water by sampling at the inflow and outflow points of water treatment plants, there is a notable scarcity of research examining the water that is directly delivered to consumers via household and public taps. This gap is particularly evident in Turkey, where no prior studies have addressed this issue. To bridge this gap, tap water samples were collected over the course of one month from five different districts using a specially designed, fully enclosed sampling device. This device is engineered to minimize contamination and facilitate the collection of large volumes of water, a critical feature given the typically low concentrations of microplastics found in tap water. Preliminary analysis of the collected samples, conducted through visual inspection and Raman spectroscopy, confirmed the presence of microlitter in every sample, with several particles identified as microplastics. The ability to obtain large-volume samples proved essential to securing representative and statistically meaningful data. These findings highlight the widespread occurrence of microplastics in tap water and underscore the necessity for continuous monitoring at the consumer endpoint. This study contributes valuable baseline data to a limited research area and provides a robust methodological framework for future investigations into human exposure and potential health impacts related to microplastics in drinking water.

ABSTRACT

Alchemilla caucasica Buser, a species belonging to the *Rosaceae* family, is naturally distributed in the Caucasus region encompassing Turkey, Georgia, and Armenia. Various studies have revealed that *Alchemilla* species contain numerous pharmacologically active compounds, primarily terpenes, tannins, and flavonoids. These flavonoids, in particular, exhibit potent antioxidant, antiinflammatory, antibacterial, antiviral, and anticancer properties. A literature review reveals that research on the cytotoxic effects of *Alchemilla caucasica* is quite limited, suggesting that future studies in this area will fill a significant gap. In this regard, our study investigated the cytotoxic and apoptotic effects of extracts obtained from the leaves and stems of *Alchemilla caucasica* on the MCF-7 breast cancer cell line. First, the effect of the extract on cell viability was determined by the MTT method. Then, the proapoptotic (Bax) and antiapoptotic (Bcl-2) gene expression levels in cells treated with the extract were determined by the RT-QPCR method. In this study, *Alchemilla caucasica* extract was applied to MCF-7 cell line at different concentrations for 24 and 48 hours. According to the MTT test results, after 48 hours of exposure to *Alchemilla caucasica* extract, cell viability in the leaf part was found to be 57% ($P<0.0001$) starting from a dose of 500 µg/mL, and cell viability was observed at doses below this dose. After 48 hours of exposure to *Alchemilla caucasica* extract, cell viability in the stem part was found to be 50% ($P<0.0001$) starting from a dose of 1000 µg/mL. Furthermore, it was determined that stem and leaf extract applied at a concentration of 250 µg/mL for 48 hours increased Bax gene expression levels in MCF-7 cells. Bcl-2 gene expression levels decreased with 250 µg/mL leaf extract and increased with stem extract. We believe the findings will highlight new supportive approaches for breast cancer treatment

Keywords: *Alchemilla caucasica* Buser, MCF-7, cell culture, cytotoxic activity, apoptotic effect.

NEUROPROTECTIVE EFFECT OF A NOVEL BENZIMIDAZOLIUM DERIVATIVE: AN APPROACH THROUGH DNMT-MEDIATED EPIGENETIC REGULATION

Fatma YILDIZ
Alanya Alaaddin Keykubat University, Department of Medical Laboratory Techniques, Health Services Vocational School, Molecular Biology, Antalya-Turkey

ORCID:0000-0002-9270-9062

ABSTRACT

Neurodegenerative diseases (ND) are a group of diseases characterized by progressive neuronal loss, synaptic dysfunction, and cognitive or motor impairments, and are not yet fully treatable. Oxidative stress, mitochondrial degradation, protein aggregation, and epigenetic changes are among the primary causes of neuronal death in these diseases. The role of epigenetic mechanisms, particularly DNA methyltransferase (DNMT) enzymes, in the development of NDs is gaining increasing importance. DNA methylation plays a critical role in regulating neurological functions such as brain development, synaptic plasticity, learning, and memory. This study investigated the role of newly synthesized benzimidazolium salt (BS) on epigenetic mechanisms (especially DNMTs) against H_2O_2-induced neurotoxicity in neuron-like differentiated SH-SY5Y cells. First, retinoic acid was applied to SH-SY5Y cells to produce mature neurons. Then, a toxicity model was created by treating neuron-like differentiated SH-SY5Y (d-SH-SY5Y) cells with H_2O_2. The BS dose to be applied to d-SH-SY5Y cells in the study was decided by MTT assay. DNMT1, DNMT3a, and DNMT3b gene expression levels were determined by RT-qPCR. According to our findings, DNMT1, DNMT3a, and DNMT3b gene expression levels in the neurodegenerative model group (H_2O_2) showed a statistically significant increase compared to the control group (3.56; 4.48; 2.70 fold change, respectively). This increase indicates that the model activates cellular stress and gene silencing processes at the epigenetic level. In addition, 2.5 µM and 5 µM BS pretreatment significantly decreased DNMT1, DNMT3a, and DNMT3b gene expression levels in d-SH-SY5Y cells compared to the H_2O_2 group ($p<0.0001$). Our results suggest that BS pre-applied to cells exerts a neuroprotective effect by suppressing or normalizing DNMT-mediated epigenetic changes. Therefore, based on these data, we believe that BS can be considered a neuroprotective agent in ND models and provides preliminary data for assessing the role of other epigenetic mechanisms (histone modifications and non-coding ribonucleic acid regulation).

ABSTRACT

This study investigated the morphophysiological and biochemical responses of three *Vitis vinifera* L. cultivars (‘Muscat Italia’, ‘Michele Palieri’, and ‘Red Globe’) grown under two contrasting climatic environments during the 2023–2024 seasons. The experiments were conducted at two sites: one representing optimal climatic conditions and the other characterized by low winter temperatures. Cold stress markedly influenced vegetative growth, leaf anatomy, and physiological functions, with distinct cultivar-dependent responses. Shoot length, leaf area, stomatal density, and chlorophyll content decreased under cold conditions, whereas leaf temperature and cuticular wax accumulation increased. Stomatal conductance (gs) declined significantly, showing mean reductions of 40% in ‘Muscat Italia’, 36% in ‘Red Globe’, and 20% in ‘Michele Palieri’, with slight interannual variability. In contrast, the levels of biochemical compounds such as proline, total soluble sugars, flavonoids, and anthocyanins increased significantly in response to cold stress. Proline accumulation was particularly pronounced, rising by 98% in ‘Muscat Italia’, 72% in ‘Michele Palieri’, and 56% in ‘Red Globe’. Overall, the cultivar ‘Michele Palieri’ demonstrated superior tolerance and adaptive potential, making it a promising candidate for viticulture expansion in colder or mountainous regions under future climate change scenarios.

Keywords: *Vitis vinifera* L., cold stress, vegetative growth, physiological traits, biochemical compounds, cultivar adaptation.

INTELLIGENT SOLAR POWER FORECASTING USING HYBRID CNN-LSTM ARCHITECTURE: AN IOT-ENABLED EMBEDDED SYSTEMS APPROACH

Mokesh Velraj
R.M.K. Engineering College, Chennai, Tamil Nadu, India
Email: mokeshv.professional@gmail.com

ABSTRACT

Solar photovoltaic (PV) systems have emerged as critical renewable energy sources, yet their intermittent generation patterns pose significant challenges for grid stability and energy management systems. This paper presents a novel hybrid Convolutional Neural Network-Long Short-Term Memory (CNN-LSTM) architecture integrated with an IoT-based embedded monitoring system for accurate, real-time solar power forecasting. The proposed system utilizes an ESP32 microcontroller-based hardware platform to collect real-time meteorological data including voltage, current, ambient temperature, and solar irradiance measurements. The CNN component effectively extracts spatial features and correlations from multi-dimensional sensor data streams, while the LSTM network captures complex temporal dependencies and time-series patterns essential for accurate forecasting. Experimental validation using two years of historical data from the Chennai region demonstrates superior performance with RMSE of 47.58 W/m2, MAE of 22.64 W/m2, and R2 of 96.94%, achieving 28.79% improvement over traditional Support Vector Regression methods and 4.56% improvement over standard LSTM networks. The embedded IoT system enables remote monitoring and predictive maintenance capabilities, reducing operational costs by 15-20% through optimized energy utilization and early fault detection. This integrated hardware software solution addresses critical challenges in renewable energy optimization and provides a scalable, cost-effective framework suitable for deployment in distributed solar microgrids and smart grid applications.

ARTIFICIAL ORGANS AND 3D BIOPRINTING

R. Devadharshini
Faculty of pharmacy, Bharath institute of higher education and research, chennai-600073
W. Helen
Faculty of pharmacy, Bharath institute of higher education and research, chennai-600073

ABSTRACT
Artificial organs and 3D bioprinting represent groundbreaking advancements in modern biomedical science, offering transformative solutions for organ failure and tissue loss. Artificial organs—such as mechanical hearts, artificial kidneys, and bioengineered skin—aim to replicate the function of natural organs, reducing dependence on organ donors and lowering the risk of transplant rejection. With the emergence of 3D bioprinting, the field has rapidly evolved toward creating patient-specific tissues using biomaterials, living cells, and growth factors. This technology enables precise layer-by-layer fabrication of complex structures such as blood vessels, cartilage, liver tissue, and even early-stage heart constructs. The integration of computer-aided design, biocompatible scaffolds, and stem cell technologies has significantly improved tissue viability and structural integrity. Despite challenges like vascularization, immune response, and large-scale production, 3D bioprinting holds immense promise for regenerative medicine, drug testing, and personalized therapeutic applications. Together, artificial organs and 3D bioprinting are shaping a future where customized, functional organ replacements may become widely accessible, revolutionizing patient care and reducing the global burden of organ shortages.

ABSTRACT

Background: The increasing prevalence of fungal infections and rising antifungal drug resistance present urgent challenges for global health. Tea tree oil (TTO), extracted from the leaves of Melaleuca alternifolia, has emerged as a promising natural agent with notable antifungal, anti-inflammatory, and wound-healing properties. Objective: This review aims to provide a comprehensive analysis of the antifungal mechanisms and therapeutic applications of TTO and its primary monoterpene constituents, with focus on clinical and technological advancements. Methods: A systematic literature review was conducted using major scientific databases to identify recent studies on the antifungal activity, mechanistic pathways, and clinical applications of TTO and its constituent compounds such as terpinen-4-ol, 1,8-cineole, α-terpinene, p-cymene, and limonene. Criteria included studies with primary data, reports on mechanisms of action, and advancements in formulation strategies. Results: TTO exhibited potent antifungal effects against a broad spectrum of fungi, including Candida albicans, Aspergillus niger, and dermatophytes. The primary component terpinen-4-ol disrupts fungal cell membrane integrity, induces oxidative stress and mitochondrial dysfunction, and inhibits hyphal development and spore germination. Recent formulations, such as nanoemulsions and polymeric gels demonstrate enhanced stability, solubility, and skin penetration, further supporting TTO's clinical effectiveness. Comparative studies show TTO offers distinct advantages over traditional antifungals, including a reduced risk of resistance and synergistic efficacy. Conclusions: Tea tree oil and its monoterpenes possess multifaceted antifungal mechanisms, making them valuable candidates for adjunctive or alternative antifungal therapies. Ongoing research into optimized delivery systems and safety will help to solidify TTO's role in modern antifungal treatment, especially for drug-resistant and superficial mycoses.

Keywords: Tea tree oil, Melaleuca alternifolia, antifungal, terpinen-4-ol, mechanism of action, topical therapy, formulation, drug resistance.

GEOMECHANICS OF ANDESITIC ROCK UNITS IN THE GUNUNG GEULIS AREA, SUMEDANG REGENCY, INDONESIA

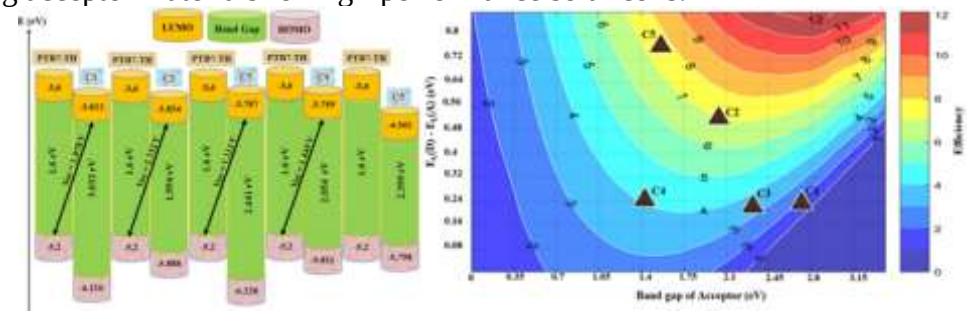
ABSTRACT

This study evaluates the influence of weathering and rock discontinuities on the geomechanical behavior of andesitic rocks in the Gunung Geulis area, Sumedang Regency, Jatinangor, Indonesia. The region is characterized by complex volcanic lithologies, including andesitic lava, lapilli tuff, and agglomerates, affected by tropical weathering and structural deformation linked to regional fault systems. The research combines geological field mapping, systematic rock sampling, Schmidt hammer testing, and simulated laboratory analyses. A total of 60 rock samples 30 fresh and 30 weathered were collected from three slope sections. Laboratory simulations estimated key parameters such as uniaxial compressive strength (UCS), point load index, porosity, and unit weight following ASTM standards. The UCS of fresh rocks ranges from 60–120 MPa, while weathered samples exhibit significantly lower strength (15–40 MPa). Porosity increases and density decreases with weathering, confirming its weakening effect. Discontinuity analysis using DIPS software revealed joint orientations that align with slope faces, contributing to potential planar and wedge failures. Rock mass classification using RMR and GSI showed fair to poor rock mass quality, especially in weathered zones. These findings highlight the importance of lithology, weathering intensity, and discontinuity characteristics as key geomechanical controls. The results support slope stability assessments and can guide hazard mitigation, infrastructure planning, and further geotechnical research in similar volcanic terrains.



Keywords: Geomechanics, Andesitic rock, Weathering, Discontinuities, Slope stability

SURVEYING NOVEL PYRAZINE ACCEPTOR MATERIALS FOR BULK HETEROJUNCTION SOLAR CELLS: COMPUTATIONAL INSIGHTS INTO PHOTOVOLTAIC PERFORMANCE

ABSTRACT

The design of organic electron acceptor materials is fundamental to advancing bulk heterojunction solar cells with outstanding photovoltaic performance. Among these, pyrazine-based π-conjugated electron acceptors have shown significant improvements over conventional acceptor materials, offering enhanced optoelectronic suitability, cost-effectiveness, and stability. In this comprehensive theoretical study, we investigate the potential of novel pyrazine derivatives (C1–C5) as acceptor materials in heterojunction solar cells. Using density functional theory (DFT) and time-dependent DFT (TD-DFT), we analyze key properties such as frontier molecular orbitals, density of states, electron and hole reorganization energies, molecular electrostatic potential, global reactivity descriptors, and photovoltaic parameters. The study further explores how variations in acceptor terminal groups influence the electronic and photovoltaic behavior of the designed compounds. The results indicate that the C1–C5 derivatives exhibit excellent optical properties, low bandgaps, optimal open-circuit voltages, and energy level alignment with the PTB7-Th donor polymer—highlighting their potential as promising acceptor materials for high-performance solar cells.

ABSTRACT

Air quality is a critical indicator of environmental and public health in Delhi, India, where rapid urbanization and persistent emission sources contribute to highly variable air quality conditions. Traditional monitoring approaches provide essential observations but often fail to capture the complex interactions among meteorological parameters, emission patterns, and seasonal variability. This study aims to develop a robust predictive framework for PM2.5 concentrations in Delhi, India, using a comprehensive dataset of 7,697 samples collected over a year. The dataset includes 10 environmental parameters (Carbon Monoxide (CO), Nitric Oxide (NO), Nitrogen Dioxide (NO_2), PM2.5, and PM10, etc.) as well as 13 meteorological parameters (temperature, relative humidity, wind velocity, and atmospheric pressure, etc.). Three ML classifiers such as Random Forest (RF), Decision Tree (DT), and XGBoost, were employed, and their performance was evaluated using metrics such as accuracy, Mean Squared Error (MSE), and Root Mean Squared Error (RMSE). SHapley Additive exPlanations (SHAP) analysis was applied to identify key features and ensure model interpretability. All three models achieved prediction accuracies above 85%. SHAP analysis revealed that PM10 levels, air

quality type, atmospheric pressure, and wind speed were among the most influential factors, highlighting the combined impact of meteorological conditions and anthropogenic emissions on particulate pollution in Delhi, India. The findings demonstrate that machine learning–based models can serve as effective tools for short-term PM2.5 forecasting, enabling timely interventions, informed policy decisions, and data-driven urban health management. Future research should focus on incorporating multi-year datasets, satellite-derived aerosol products, and hybrid deep learning architectures to enhance long-term reliability and real-world applicability.

ABSTRACT
Waste management has become a critical environmental and public health issue due to rapid urbanization, industrial growth, and population expansion. Improper disposal of solid waste leads to pollution, greenhouse gas emissions, soil and water contamination and severe health hazards. To address these challenges, an integrated and sustainable waste management approach is essential. Modern waste management systems emphasize waste minimization at the source, segregation, recycling, composting of organic materials, energy recovery technologies, and safe scientific disposal of non-recyclable residues. Additionally, emerging innovations such as IoT- based waste tracking, smart bins, decentralized waste processing systems, and circular economy models are enhancing efficiency and resource recovery. Public participation, policy enforcement, and awareness programs play a crucial role in ensuring effective implementation. A comprehensive waste management strategy not only reduces environmental impacts but also converts waste into valuable resources, promoting sustainable development and cleaner urban living.

ABSTRACT
The increasing global energy demand and the depletion of conventional energy resources have accelerated the need for a more efficient, reliable, and sustainable power system. Smart Grid technology has emerged as a modern solution that combines electrical engineering, renewable energy integration, automation, and communication networks to revolutionize the existing power infrastructure. Unlike traditional power grids that operate in a unidirectional flow of electricity, Smart Grids facilitate bidirectional communication between utilities and consumers, enabling real-time monitoring, control, and optimization of energy usage. This intelligent system not only enhances energy efficiency but also ensures better utilization of renewable energy sources such as solar, wind, and hydro power. However, the implementation of Smart Grids faces several challenges, including grid instability due to fluctuating renewable inputs, high installation and maintenance costs, cybersecurity vulnerabilities, and the need for advanced data management systems. To address these challenges, our research focuses on developing an integrated Smart Grid model using IoT-based sensors, Artificial Intelligence (AI), and Machine Learning (ML) algorithms. These technologies enable accurate prediction of energy demand, fault detection, automated load balancing, and self-healing capabilities. The proposed system can adapt to variations in renewable energy generation, ensuring uninterrupted and stable power supply even during peak demand conditions. Furthermore, the integration of big data analytics will allow continuous evaluation of grid performance, while blockchain technology can ensure secure and transparent energy transactions between producers and consumers. The use of decentralized control systems reduces dependency on centralized power plants, promoting the concept of microgrids and community-based renewable energy systems. By implementing this intelligent grid model, we can achieve higher energy efficiency, reduced carbon emissions, and improved reliability of power delivery. This research aims to create a future-ready power system that aligns with global sustainability goals while enhancing the overall performance and resilience of the electrical network

ABSTRACT

Pollution is one of the most critical environmental issues affecting life on Earth. It refers to the introduction of harmful substances or contaminants into the natural environment, causing adverse effects on living organisms and the ecosystem. Rapid industrialization, urbanization, deforestation, and technological advancement have accelerated pollution levels globally. There are several major types of pollution, including air, water, soil, noise, and thermal pollution. Air pollution results from the release of toxic gases and particulates from vehicles, industries, and the burning of fossil fuels, leading to respiratory diseases and global warming. Water pollution occurs when harmful chemicals and waste materials contaminate water bodies, affecting aquatic life and human health. Soil pollution arises from the excessive use of pesticides, fertilizers, and improper waste disposal, reducing soil fertility. Noise pollution, caused by traffic, industrial operations, and urban activities, affects human mental health and wildlife behaviour. Thermal pollution is the rise in water temperature due to industrial discharges, disturbing aquatic ecosystems. In conclusion, pollution poses a serious threat to the balance of nature and human well-being. Effective waste management, renewable energy use, afforestation, and strict environmental regulations are essential to control pollution and ensure a sustainable future.

Keywords: Pollution, Environment, Air Pollution, Water Pollution, Soil Pollution, Noise Pollution, Thermal Pollution, Industrialization, Urbanization, Ecosystem, Contamination, Global Warming, Health Hazards, Waste Management, Sustainability.

ABSTRACT

In present work, a series of novel structural hybrids of 1,3,4-oxadiazole and carbamothioate was designed by chemical modification of 2-(4-isobutylphenyl) propanoic acid. Target compounds (7a-f) were synthesized in significant yields (84-88%) by coupling compound (4) with different electrophiles under different reaction conditions. The structures of oxadiazole based carbamothionate derivatives were confirmed by spectroscopic (FTIR, ^{1}HNMR, ^{13}CNMR) and physiochemical methods. During *in-vivo* experimentation, all synthesized compounds were tested through 6 Hz (32 mA) and PTZ (80 mg/kg) mouse seizure models. The 7b and 7c showed significant outcomes ($P<0.05$) in terms of seizure severity, protection and mortality. The behavioural outcomes of PTZ tests were further strengthened with video electroencephalogram (vEEG) findings in which EEGs were analyzed for epileptic spikes to understand the impact of 7b and 7c treatment on these ictal activities. The 7b was found most efficient in reducing the seizure spiking activity in brains of PTZ-treated mice while both 7b and 7c significantly reduced overall PTZ-induced seizure severity. The molecular docking studies also predicted the BBB permeability, reduced binding energies and good compound interaction with $GABA_A$ receptors and SV2A protein. Therefore, the observed pharmacological outcomes might be attributed to the $GABA_A$ agonistic and SV2A modulating potential of these oxadiazole-carbamothioate hybrid compounds.

ABSTRACT

One of the most important uses of autonomous vehicles is highway driving, specifically when it comes to the complicated problem of changing lanes in busy, complex, and rapidly changing environments. Lane changes require immediate decisions to be made while ensuring safety and considering the overall efficiency and comfort of the passengers. To address all these factors, we propose an integrated approach which merges cutting-edge sensor fusion technology with optimal trajectory planning. By using internal and external sensors, the proposed framework can track and understand the environment in all surroundings while emphasizing critical object detection. Through focused sensor fusion, the data from disparate sources can be integrated, which improves complex scenario perception reliability. For path generation, we use the Frenet coordinates system with jerk optimized planning, which creates smooth, feasible, and collision-free paths that align with road curvature. The approach taken reduces sharp turns, thus ensuring the comfort of passengers. The framework has been validated through a highway lane-change simulation platform that exemplifies a variety of traffic conditions. Results show that automated lane changes successful executed within the time headway parameters and adapted appropriately to the dynamic system changes. When sensor fusion predictive trajectory planning was employed, more robust and safe decision making was executed. These results contrast to the sensor fusion predictive trajectory planning results. This results indicate more robust and safe decision making when predictive sensor fusion is used to guide automated lane changes. This autonomous driving study combines perception with trajectory optimization, paving the way for intelligent lane-changing algorithms and more autonomous vehicles that are safe and reliable for highway travel.

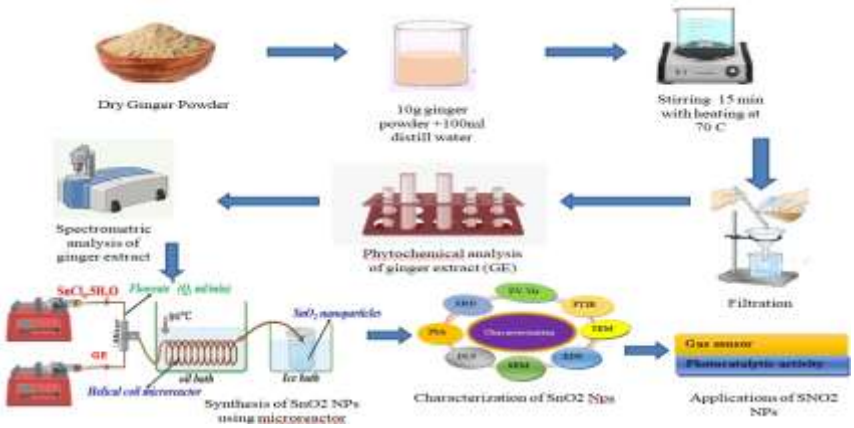
ABSTRACT

Dance, while often celebrated as a performing art, also demands the physical rigor and discipline of a high-performance sport. Dancers endure intense training schedules, long rehearsals, and physically demanding performances that require strength, endurance, flexibility, coordination, and mental focus. As with athletes in any sport, proper nutrition plays a critical role in supporting the physical and cognitive demands of dancers. In recent years, the integration of functional foods into dancers' diets has gained increased attention for its potential to enhance performance, support recovery, and prevent injuries. This review explores the dual nature of dance—as both an expressive art form and a physically intensive sport—and highlights the unique nutritional requirements of dancers. Unlike many traditional athletes, dancers often face pressures related to body image and aesthetic expectations, which can influence their dietary behaviors and risk of nutrient deficiencies. Functional foods—such as those rich in antioxidants, omega-3 fatty acids, probiotics, and bioactive compounds—offer targeted benefits, including improved joint health, enhanced muscle recovery, reduced inflammation, and better gut health. Such foods can be particularly beneficial for dancers striving to maintain peak physical condition without compromising their long-term health. By examining current research on functional nutrition in the context of dance, this paper aims to provide practical insights for dancers, coaches, and nutritionists. It underscores the importance of evidence-based dietary strategies that support both the artistic and athletic dimensions of dance, contributing to the overall performance, resilience, and well-being of dancers across various styles and levels of expertise.

Keywords: dance, functional food, sports nutrition, dancer health, performance enhancement.



PROCESS INTENSIFICATION BY CONTINUOUS FLOW MICROREACTOR FOR THE SYNTHESIS OF SNO_2 NANOPARTICLES USING NATURAL REDUCING AGENT

ABSTRACT
Water pollution is one of the major challenges faced now a days due to lot of carcinogenic and hazardous chemicals released by various dyes. Enhancement in the capabilities such as heat transfer, reaction kinetics, scalability, yields etc were observed in the chemical products synthesized by continuous flow microreactor, as it utilizes the synthesis technique of flow chemistry. Continuous flow microreactors are more advantageous than conventional batch reactors, as reaction takes place in the microchannel and also continuously. The present study highlights the synthesis of SnO_2 nanoparticles in a continuous flow microreactor using natural reducing agent. SnO_2 is a n – type semiconductor and till now exploration has not conducted on synthesis of SnO_2 nanoparticles in a continuous flow microreactor using natural reducing agents, which acts also as capping agent. Natural reducing agents are highly proficient sources of flavonoids, phenols etc which do not produce any hazardous chemicals that damage ecosystem during the synthesis of SnO_2 nanoparticles. Characterization is done by X – Ray Diffraction, Fourier Transform Infrared Spectroscopy, TEM and SEM.

Keywords: *Microreactor, reaction kinetics, nanoparticles, capping agent, semiconductor*

ABSTRACT

Purpose: This study seeks to explore the role of emotional intelligence (EI) training in boosting managerial effectiveness within organizations. It aims to clarify the connection between EI skills and managerial outcomes, including decision-making, team leadership, and adaptability. Methodology: The research relies on secondary data analysis from peer-reviewed journals, organizational case studies, and meta-analytical reports published in the last ten years. A systematic review method was employed to compile findings on the implementation and results of EI training programs. Findings: The review reveals that managers who participate in EI training show enhanced communication, better conflict management skills, and increased motivation among their team members. Organizations that incorporate EI-focused interventions experience noticeable improvements in leadership performance and employee engagement. Implications: The findings highlight the importance of institutionalizing EI training as a strategic tool for leadership development rather than treating it as a secondary HR initiative. It provides valuable insights for academics, HR professionals, and policymakers aiming to improve managerial skills through evidence-based emotional intelligence frameworks.

ABSTRACT

Grocery stores, as a common form of retail chain, play a pivotal role in shaping consumer behavior and environmental responsibility. The idea of a sustainable grocery store extends beyond the traditional shopping experience to create an ethical, economical, and eco-friendly space where waste materials are minimized, reused, and transformed into resources. These stores aim to eliminate plastic packaging by promoting alternatives such as refill stations and encouraging customers to bring their own reusable containers. The primary goal is to reduce dependency on single-use plastics while promoting the guiding principles of the 3Rs: Reduce, Reuse, and Recycle. This research adopts a design-based methodology to conceptualize and evaluate sustainable grocery stores. Site observations, spatial analysis, and case studies of existing zero-waste and green stores are employed to identify design elements that enhance user experience, operational efficiency, and environmental performance. The methodology focuses on how interior layouts, material selection, circulation patterns, and display systems can be optimized to encourage sustainable practices. Attention is also given to the integration of renewable energy systems, natural lighting, and ventilation strategies to further reduce ecological footprints.Findings reveal that well-planned design solutions not only facilitate resource conservation and energy efficiency but also create environments that positively influence customer participation in sustainability. By prioritizing non-toxic, recyclable, and locally sourced materials, these stores foster trust and engagement within communities. Moreover, aligning with the United Nations Sustainable Development Goals (SDGs), sustainable grocery stores serve as prototypes for environmentally responsible retailing, offering a replicable model that balances ecological impact with commercial viability.

Keywords: Sustainable design, zero waste grocery store, 3Rs (Reduce, Reuse, Recycle), green building, resource conservation, user-centered design, renewable energy integration.

DESIGN AND DEVELOPMENT OF ORAL CONTROLLED RELEASE SYSTEMS FOR SUSTAINED DRUG DELIVERY

ABSTRACT
Oral controlled release medication delivery systems are made to minimize dosage frequency and adverse effects while maintaining therapeutic drug concentrations in the systemic circulation for prolonged periods of time. Drug physicochemical characteristics, biopharmaceutical considerations, polymer selection, and formulation techniques are all carefully taken into account during the development of such systems. To produce prolonged release by regulating the rate of drug dissolution, diffusion, or erosion, a variety of technologies are used, such as hydrophilic matrix systems, osmotic pumps, reservoir systems, and gastroretentive dosage forms. The possibilities for accurate release modulation have been further increased by developments in polymer chemistry and contemporary processing methods like hot-melt extrusion and 3D printing. Controlled release formulations are very useful for managing chronic diseases because they improve therapeutic efficacy, decrease variations in plasma drug levels, and improve patient compliance. An overview of the fundamentals, design factors, assessment criteria, and most current developments in oral controlled release systems for long-term medication delivery are given in this article.

ABSTRACT

Industry-scale pollution monitoring in steel manufacturing is hindered by unreliable GPRS communication, frequently resulting in loss of emission data and compliance risks. In response, this work presents a secure, resilient architecture employing edge controllers for local storage of encrypted stack emission metrics, including SPM, SO_2, CO, flow, and temperature. Data is encrypted with AES prior to transmission, ensuring privacy and integrity. Block-chain-based data validation implements immutability and auditability via chained cryptographic hashes. Upon network restoration, verified records are transmitted securely to a central server. Neural network models are deployed to process stored and live data, enabling predictive analytics and anomaly detection for early intervention. Field deployment confirms the elimination of data loss during outages, enhanced security, and proactive compliance management. The integrated solution transforms traditional pollution monitoring into an adaptive, intelligent system, supporting data-driven optimization and regulatory assurance, and is broadly applicable across industrial environmental monitoring scenarios.

Keywords: Steel industry; pollution monitoring; edge computing; data encryption; block-chain; neural networks; GPRS outage; anomaly detection; compliance

ABSTRACT

The quaternary $I_2-II-IV-O_4$ semiconductors, like Li_2ZnSnO_4, hold promise as a solar absorber for photovoltaic and optoelectronic applications. In this work, we focused on (a) a theoretical study and (b) an experimental investigation of Li_2ZnSnO_4 composition. In the theoretical part, the structural, electrical, and optical properties of Li_2ZnSnO_4 are analyzed using a first-principles approach within the framework of density functional theory (DFT), as implemented in the CASTEP code. The mechanical stability of the compound is verified using the Born-Huang criteria, with the estimated elastic constants indicating that Li_2ZnSnO_4 is mechanically soft, malleable, and isotropic. Electronic band structure analysis reveals that the monoclinic phase of Li_2ZnSnO_4 exhibits a direct electronic transition with a bandgap of 2.011 eV. Optical properties such as the dielectric function, absorption, reflectivity, refractive index, optical conductivity, and loss function are also studied. The absorption coefficient of Li_2ZnSnO_4 is found in the order of $\sim 10^5$ cm^{-1} in the UV region. Its high absorption, low reflectivity, and optical anisotropy make it an excellent candidate for waveguides, dielectric condensers, optical displays, and UV-based photocatalysts. In the experimental part, we synthesized Li_2ZnSnO_4 by sol-gel method and studied its structural and morphological properties using TG-DTA, XRD, SEM, FTIR, and UV-Vis optical properties by spectrophotometer. The thermal behavior of the Li_2ZnSnO_4 compound was examined using DG-DTA to determine the optimal calcination temperature for stabilizing the compound. XRD results show that the compound crystallizes in a monoclinic phase with lattice parameters of a = 4.741 Å, b = 7.984 Å, c = 9.538 Å, β = 84.64°, and a cell volume of 359.472 $Å^3$. The average crystallite size of the synthesized Li_2ZnSnO_4 crystallites, calculated using Scherrer's formula, is 35.33 nm. SEM images reveal grains are interconnected and irregular in shape and size. FTIR analysis confirms the formation of the compound, with strong stretching vibrations corresponding to Zn-O and Sn-O bonds, along with characteristic C-H and C=C bonds. UV-Vis spectroscopy indicates high transmittance and reflectance, with an optical direct bandgap of 1.801 eV. Moreover, optical parameters such as the refractive index, absorption coefficient, extinction constant, and dielectric functions (both real and imaginary components) are analyzed as a function of photon energy. Overall, the experimental and theoretical findings of Li_2ZnSnO_4 manifest the suitability of optical and photocatalytic applications.

ABSTRACT

The discharge of synthetic dyes from textile and industrial effluents into aquatic ecosystems poses severe environmental and health hazards, necessitating the development of sustainable dye removal strategies. This study aims to investigate the feasibility of using eggshell powder (ESP), a cost-effective and eco-friendly waste material, as a natural adsorbent for the removal of methyl orange (MO), a commonly used anionic azo dye, from aqueous media. The study explores the adsorption process in terms of kinetics, isotherms, thermodynamics, and mechanistic pathways. ESP was prepared through washing, drying, grinding, and sieving processes, and characterized using SEM, EDX, FTIR, and pHZPC analysis to understand its surface morphology, elemental compositions, and functional groups. Batch adsorption experiments were conducted to optimize parameters, including pH, initial dye concentration, contact time, ESP dosage, and temperature. The optimal dye removal (73.86%) and adsorption capacity 4.61665 mg/g were achieved at pH 2.0, 5 ppm dye concentration, 0.4 g/L ESP dosage, 30 °C, and 65 minutes contact time. Kinetic studies revealed that the adsorption followed the Lagergren pseudo-first-order model ($R^2 = 0.9554$), indicating a physisorption-driven process. Isotherm analysis showed better correlation with the Freundlich model, suggesting multilayer adsorption on heterogeneous surfaces. Thermodynamic analysis revealed a negative enthalpy change ($\Delta H = -98.61$ kJ/mol), supporting an exothermic and spontaneous chemisorption mechanism. The proposed adsorption mechanism involves both electrostatic attraction and π–π interactions between MO and the ESP surface. This study demonstrates the promising potential of unmodified eggshell powder as a sustainable and efficient adsorbent for dye-contaminated water.

INFLUENCE OF CLIMATIC FACTORS AND CROPPING SYSTEM ON THE AGRONOMIC CHARACTERISTICS OF OLIVES (OLEA EUROPAEA *L.*) OF THE *MOROCCAN PICHOLINE* VARIETY CULTIVATED IN THE OLIVE-GROWING REGIONS OF MOROCCO

ABSTRACT

The Moroccan olive oil sector is distinguished by a great varietal diversity, dominated at 96% by the *Moroccan Picholine* variety. This study aims to agronomically characterize the olives of this variety cultivated in two large regions: the north, including Tetouan, Chaouan and Ouazzane, and the center, encompassing Settat, Kelaa of Sraghna and Marrakech. In each site, five trees were sampled, at a rate of 40 fruits per tree. The objective of this work is to study the influence of cropping system (irrigated/rainfed) and climatic factors on olive tree pomology in different sites in Morocco. Eight quantitative traits concerning fruit weight (FM), stone mass (CM), fruit length (FL), fruit width (FW), fruit length/width (FL/FW), stone length/width (CL/CW) and Pulp/stone ratio (PC) as well as an indirect estimation of oil content via the percentage of pulp (PF). The results reveal significant variations across sites: the size and productive potential of olives differ progressively, while shape-related characteristics play a secondary role. Olives are larger in the irrigated sites Kelaa of Sraghna, Settat, and Marrakech, and smaller in the rain-fed sites of Ouazzane, Chaouan, and Tetouan. These variations are mainly explained by environmental conditions, including climatic factors and the cropping system. Irrigated systems produce larger, oil-rich olives than rainfed systems.. During the 2023-2024 agricultural campaign.

Keywords: Olive tree, *Moroccan Picholine*, north-center, cropping system, agronomical parameters.

STRUCTURAL AND OPTICAL PROPERTIES OF BARIUM DOPED LANTHANUM MOLYBDATE

ABSTRACT

Lanthanum based scheelite-type oxides have recently attracted attention for their luminescence and thermal conduction properties. These studies mainly focused on the undoped $La_2Mo_3O_{12}$ for thermal conductivity and lanthanide doped (Eu, Dy, Sm etc.) $La_2Mo_3O_{12}$ for luminescence applications of the material. In this study, Ba doped (≤5%) $La_2Mo_3O_{12}$ was prepared using a co-precipitation and calcination approach. The structure of the samples was studied by XRD and SEM, and UV-Vis spectroscopy and photoluminescence measurements were carried out to investigate the optical properties. XRD results showed that single phase Ba doped samples could be synthesised with a simple approach. The samples had a monoclinic structure with space group C2/c. SEM results showed that the particle size was unaffected by the level of Ba doping. SEM micrographs showed that the particles had sphere-like irregular shapes with ~1 μm diameter. SEM-EDS results revealed the homogeneous distribution of La, Mo, Ba and O elements in the samples. Optical band gap, E_g values were calculated from the UV-vis spectroscopy data using Tauc relationship given by $(\alpha h\nu)^n = A(h\nu-E_g)$. The results showed that E_g was 3.03-3.32 eV for the samples. The emission spectra of the Ba doped samples were recorded under the excitation at 352 nm. A prominent emission band at ~530 nm was observed for all the samples.

ÖZET

PA 6.6 (Poliamid 6.6), yüksek mekanik dayanım, ısıya direnç, boyutsal kararlılık ve aşınma direnci gibi üstün özellikleri sayesinde otomotiv, elektrik-elektronik, tekstil ve ambalaj sektörlerinde yaygın olarak kullanılan bir mühendislik termoplastiğidir. Ancak, PA6.6 malzemeleri uzun süreli nem veya suya maruz kaldığında hidrolitik olarak bozunabilir. Bu durum, özellikle dış ortam koşullarına açık otomotiv parçalarında mekanik performansın düşmesine yol açmaktadır. Bu nedenle, hidroliz dayanımı geliştirilmiş yeni formülasyonların oluşturulması, malzemenin kullanım ömrü ve güvenilirliği açısından kritik önem taşımaktadır. Bunun yanında, Lazer kaynaklama, yüksek hassasiyetli, hızlı ve temiz bir birleştirme yöntemi olarak otomotiv üretiminde giderek daha fazla tercih edilmektedir. Bu yöntemin başarılı olabilmesi için, kaynaklanacak malzemelerin lazer ışığına karşı belirli bir transparanlık ve soğurma dengesi göstermesi gerekmektedir. Bu çalışmada geliştirilen PA6.6 bazlı malzeme, bu optik özellikleri optimize edecek katkı sistemleri ile tasarlanmıştır. Böylece, siyah renkte olan malzemenin lazer ışığını belirli dalga boylarında geçirerek kaynaklanabilirlik özelliğini koruması beklenmiştir. Çalışmada, otomotiv endüstrisinde lazer kaynaklama prosesine uygun, cam elyaf dolgulu ve hidroliz dayanımlı siyah PA 6.6 kompozit malzeme geliştirilmesi hedeflenmiştir. Hazırlanan karışımlar, çift vidalı ekstrüder kullanılarak eriyikten karıştırma yöntemi ile hazırlandıktan sonra fitil formunda üretilmiştir. Ekstrüzyon sonrası elde edilen polimer fitiller, granülatör yardımıyla granül hale getirilmiştir. Bu granüller, ISO 527 standardına uygun çekme plakaları ve darbe plakaları halinde preslenerek test numuneleri hazırlanmıştır. Üretilen numuneler üzerinde mekanik testlerin yanı sıra lazer geçirgenlik analizleri yapılmıştır. Lazer transparanlık testleri ile farklı plaka kalınlıklarında (0,8 mm, 1,6 mm ve 3,2 mm) üretilen malzemenin lazer geçirgenliği yüzdesi belirlenmiştir. Üretilen malzemelerde, hidroliz testi yapılmış ve test sonrası malzemelerin mekanik özelliklerinin; çekme ve darbe testlerinde %50 ve üzerinde korunduğu gözlemlenmiştir. Aynı zamanda lazer geçirgenlik değerinin %20 üzerinde olduğu test edilmiştir. Bu çalışma, otomotiv endüstrisinde hem fonksiyonel hem de estetik gereksinimleri karşılayabilecek, enerji verimliliği yüksek, çevre dostu ve uzun ömürlü malzeme çözümleri sunmaktadır.

Anahtar Kelimeler: Poliamid 6.6, Mekanik Özellikler, Lazer Geçirgenlik, Hidroliz Dayanımı

DEVELOPMENT OF HYDROLYSIS RESISTANT PA6.6 COMPOSITE MATERIALS WITH LASER TRANSPARENCY SUITABLE FOR USE IN THE AUTOMOTIVE INDUSTRY

ABSTRACT

Polyamide 6.6 (PA66) is an engineering thermoplastic widely used in the automotive, electrical-electronic, textile, and packaging industries due to its superior properties such as high mechanical strength, heat resistance, dimensional stability, and wear resistance. However, PA66 materials can undergo hydrolytic degradation when exposed to moisture or water for extended periods. This phenomenon leads to a decline in mechanical performance, particularly in automotive components exposed to outdoor environmental conditions. Therefore, developing new formulations with improved hydrolysis resistance is of critical importance in terms of the material's service life and reliability. In addition, laser transmittance has become an increasingly preferred joining method in automotive manufacturing due to its high precision, speed, and cleanliness. For successful laser transmittance, the materials to be joined must exhibit an appropriate balance of laser transparency and absorption. In this study, a PA66-based material was formulated with additive systems optimized for these optical properties, enabling the black-colored material to maintain weldability by transmitting laser light at specific wavelengths. The study aimed to develop a glass fiber reinforced, hydrolysis-resistant, and laser-transparency black PA66 composite suitable for the laser transmittance process in the automotive industry. The prepared mixtures were compounded using a twin-screw extruder through a melt-blending process and subsequently pelletized via a granulator. The resulting granules were compression molded into tensile and impact specimens in accordance with ISO 527 standards. The samples produced were subjected to mechanical tests as well as laser transmittance analyses. Laser transparency tests were conducted on plates of different thicknesses (0.8 mm, 1.6 mm, and 3.2 mm) to determine the percentage of laser transmittance. After hydrolysis testing, the mechanical properties of the materials were retained by 50% or more in tensile and impact performance, while the laser transmittance value exceeded 20%. This study presents an energy-efficient, environmentally friendly, and durable material solution that meets both the functional and aesthetic requirements of the automotive industry.

ÖZET

Günümüzde hızla artan plastik tüketimi ve buna bağlı olarak ortaya çıkan atık miktarı, sürdürülebilir üretim anlayışını endüstriyel süreçlerin vazgeçilmez bir parçası haline getirmiştir. Özellikle elektrik-elektronik sektörü gibi yüksek performans gerektiren alanlarda, çevresel etkileri azaltırken ürün kalitesini koruyacak çözümler geliştirmek büyük önem taşımaktadır. Bu bağlamda, geri dönüştürülmüş polimerlerin mühendislik uygulamalarında yeniden değerlendirilmesi hem kaynak verimliliğini artırmakta hem de karbon ayak izinin azaltılmasına katkı sağlamaktadır. Polibütilen tereftalat (PBT) ve geri dönüştürülmüş polietilen tereftalat (rPET) harmanları, mekanik dayanım, ısıl kararlılık ve boyutsal kararlılık gibi özellikleriyle sürdürülebilir mühendislik plastikleri arasında öne çıkmaktadır. Bu çalışma kapsamında, elektrik-elektronik uygulamalarında kullanılmak üzere PBT/rPET harmanlarının geliştirilmesi ve bu harmanların RAL renk hedeflerine uygun biçimde üretilmesi amaçlanmıştır. Böylece, geri dönüştürülmüş malzemelerin yüksek katma değerli uygulamalarda kullanılabilirliği artırılarak hem çevresel hem de ekonomik sürdürülebilirliğe katkı sunulması hedeflenmiştir. Ral kartelası, boya, kaplama ve plastikler için renkleri tanımlayan bir Avrupa renk eşleştirme sistemidir. Bu çalışmada elde edilecek ürünlerde kontrol numunesiyle benzer, yüksek mekanik özelliklerde siyah, beyaz ve gri renkli elektrik-elektronik sektöründe kullanıma uygun parçalarının üretimi yapılmıştır. Bunun için, renkli, PBT ve rPET kompozitleri, çift vidalı ekstrüderde eriyikten karıştırma yöntemiyle üretilmiştir. Üretilen örneklere yönelik mekanik testler ve renk kontrolü, enjeksiyon makinesinde basılmış test plakalarına uygulanmıştır. Üretilen malzemelerin karakterizasyonu için çekme testi, basma ve bükülme, darbe dayanımı testleri, yük altında eğilme sıcaklığı tayini, erime sıcaklığı tayini ve renk kontrolü yapılmıştır. Çalışmada, RAL 7035, RAL 9005 ve RAL 9016 renk standardına göre ΔE renk değişim değerinin <1 olması hedeflenmiştir. Çalışma sonucunda kontrol numunesine göre mekanik özellikler etkilenmeden istenilen siyah, beyaz ve gri renge ulaşılmıştır. Renk testleri sonucunda ΔE değişimi <1 olarak tespit edilmiştir. Hem mekanik özellikler hem de renk standardı açısından hedeflenen kriterler sağlanmıştır. Geliştirilen PBT/rPET harmanları, elektrik-elektronik endüstrisinin hem fonksiyonel hem de estetik gereksinimlerini karşılayabilecek, çevreye duyarlı ve uzun ömürlü malzeme çözümleri sunmaktadır.

Anahtar kelimeler: PBT, rPET, RAL standardı, Elektrik-Elektronik Sektörü

PRODUCTION OF CUSTOM-COLORED PBT/rPET BLENDS SUITABLE FOR ELECTRICAL AND ELECTRONIC APPLICATIONS

ABSTRACT

In recent years, the increase in plastic consumption and the consequent growth in waste generation have rendered sustainable production an essential component of industrial processes. Particularly in high-performance sectors such as electrical and electronic industries, the development of solutions that mitigate environmental impact while maintaining product quality has become a critical priority. In this regard, the reuse of recycled polymers in engineering applications not only enhances resource efficiency but also contributes to the reduction of the overall carbon footprint. Among sustainable engineering plastics, polybutylene terephthalate (PBT) and recycled polyethylene terephthalate (rPET) blends have attracted considerable attention due to their suitable mechanical strength, thermal stability, and dimensional integrity. The present study aims to develop PBT/rPET blends suitable for electrical and electronic applications and to produce these blends in compliance with RAL color standards. By promoting the incorporation of recycled materials into high value-added applications, this study seeks to contribute to both environmental and economic sustainability. The RAL color chart is widely used across Europe, serves as a standardized framework for color matching in paints, coatings, and plastics. In this study, black, white, and gray components exhibiting high mechanical performance and comparable color characteristics to the control sample were produced for use in the electrical and electronic sector. Subsequently, colored PBT and rPET blends were prepared via melt blending in a twin-screw extruder. Mechanical testing and color evaluation were performed on test plaques molded by injection molding. Characterization of the produced materials included tensile, compression, and flexural strength tests, impact tests, heat deflection temperature (HDT) determination, melting temperature analysis, and color measurement. According to RAL 7035, RAL 9005, and RAL 9016 color standards, a ΔE color difference value below 1 was targeted. The target black, white, and gray colors were achieved without compromising the mechanical performance relative to the control sample. Also, color measurements confirmed that ΔE values remained below 1. Both the mechanical and color performance criteria were successfully met. The developed PBT/rPET blends consequently present environmentally responsible and durable material alternatives capable of meeting the functional and aesthetic requirements of the electrical and electronic industry.

Email: kasimxahmed@gmail.com
Abubakar D. Isah
Department of Architecture, Federal University of Technology Minna, Niger State, Nigeria

ABSTRACT

In an era marked by heightened stress and environmental degradation, restorative design is gaining prominence as a sustainable approach to architectural development. This study examines how biophilic interventions and spatial configuration strategies influence restorative experiences within resort environments in Abuja, Nigeria. Employing a quantitative research design, data were collected from a diverse sample of resort users through digital survey platforms. Descriptive and inferential analyses, including correlation, multiple regression and exploratory factor analysis (PCA with Varimax rotation), were conducted to assess relationships among Restorative Principles Evaluation (RPE), Biophilic Interventions (BIRE), and Prospect–Refuge Restorative (PRR) constructs. Findings indicate strong positive correlations between RPE and both BIRE ($r = 0.763$, $p < 0.01$) and PRR ($r = 0.632$, $p < 0.01$), with BIRE showing a stronger predictive influence on restorative perception ($\beta = 0.659$, $p < 0.001$). The model explained 59% of the total variance ($R^2 = 0.590$), confirming that the integration of daylight, vegetation, water elements and natural materials, along with spatial attributes such as legibility, prospect and refuge, significantly enhances user well-being. Demographic variations also moderated restorative appraisals, underscoring user diversity in design response. The study advances a sustainable, context-sensitive framework for resort architecture in Nigeria, advocating for restorative design strategies that align ecological sensitivity with human psychological needs.

TELEPHARMACY AND DIGITAL HEALTH ECONOMICS.

ABSTRACT
Telepharmacy, the delivery of pharmaceutical care through digital platforms, has emerged as a cost-effective model for improving healthcare access, especially in rural and underserved regions. By integrating digital health technologies such as electronic prescriptions, teleconsultations, mobile health apps, and AI-based medication management, telepharmacy reduces geographical barriers and optimizes resource utilization. From an economic perspective, it minimizes the need for physical infrastructure, lowers travel costs for patients, and decreases hospital readmissions by improving adherence and monitoring. Furthermore, digital health economics highlights the balance between upfront technology investment and long-term savings in healthcare expenditure. While challenges such as regulatory barriers, digital literacy, and data security remain, telepharmacy demonstrates significant potential in enhancing healthcare efficiency, affordability, and equity. Its adoption represents a paradigm shift towards sustainable, patient-centered healthcare systems.

ABSTRACT

The present study aimed to investigate the moderating role of self-concept clarity between celebrity worship and desire for fame among young adults. For this purpose, a sample of (*N*=300) young adults was taken from Rawalpindi and Islamabad. Data was collected from the sample via a demographic form and three questionnaires, each for one study variable. Celebrity worship was studied using the Celebrity Worship Scale CWS (McCutcheon et al., 2002), desire for fame was studied using the Desire for Fame Scale (Gountas et al., 2012), and self-concept clarity was measured using the Self-Concept Clarity Scale (Campbell et al., 1996). Correlational, regression, and moderation analyses were performed to explore the relationship between the study variables. Additionally, *t*-tests and ANOVA were applied to study the effect of demographics on the study variables. The statistical analysis revealed that celebrity worship was positively related to the desire for fame. Self-concept clarity moderated the relationship between celebrity worship and desire for fame. Self-concept clarity strengthens the relationship between celebrity worship and desire for fame. Moreover, *t*-test and ANOVA results revealed significant effects of gender and education level on celebrity worship. These findings highlight the complex role of self-concept clarity in fame-related attitudes and suggest that even individuals with a stable self-concept clarity may be influenced by celebrity cultures.

Keywords: celebrity worship, desire for fame, self-concept clarity, young adults

OPTIMIZATION-BASED DECENTRALIZED ENERGY MANAGEMENT FOR ISLANDED MULTI-MICROGRID SYSTEMS WITH RENEWABLE INTEGRATION

Alok Kumar Shrivastav

ABSTRACT

This paper presents a detailed study on decentralized energy management systems (EMS) for multiple islanded microgrids (MGs) with high penetration of renewable energy resources. This work addresses the critical challenges of maintaining power balance and minimizing operational costs in autonomous MGs without grid support, considering the inherent variability of renewables. Leveraging a benchmark network of four interconnected but independently operated MGs, the study compares two EMS paradigms: a Mixed Integer Linear Programming (MILP)-based approach and a Multi-Objective Optimization (MOO)-based framework. The MILP-based EMS formulates the resource dispatch problem as a 24-hour horizon optimization minimizing fuel costs, battery operation expenses, and cumulative penalties for load shedding. The MOO-based EMS further integrates multiple objectives encompassing cost efficiency, emission reduction, renewable utilization, and reliability, producing Pareto-optimal solutions to explore trade-offs. Using realistic, seasonally varying load and renewable generation profiles, simulations evaluate economic performances, battery state-of-charge dynamics, synchronous generator dispatch patterns, and load shedding incidents. Results indicate that the MOO-based EMS outperforms the MILP and traditional rule-based methods by achieving up to 14% and 10% cost savings in summer and winter, respectively, across diverse MG configurations. It adapts battery charging/discharging more dynamically, reduces generator runtime, and eliminates load shedding, thus enhancing reliability and autonomous operation. Additionally, AC power flow validations via MATLAB 14 confirm system stability and technical feasibility of the proposed dispatch schedules. This paper contributes a scalable, resilient EMS architecture enabling economic and reliable operation of interconnected islanded MGs under renewable variability and operational uncertainties. The findings highlight the importance of integrating multi-objective optimization into decentralized EMS designs, paving the way for advanced control strategies in future resilient power networks.

Keywords- Decentralized energy management; islanded multi-microgrid systems; mixed-integer quadratic programming (MIQP); multi-objective optimization (MOO); battery energy storage system (BESS); renewable energy integration; load shedding; economic dispatch; autonomous microgrid operation; power flow validation.

REVIEW ON PLANCK'S QUANTUM THEORY

ABSTRACT

Planck's quantum theory is introduced by Max Planck in 1900, that energy is not continuous but is emitted or absorbed in discrete/discontinuous packets called "quanta". The energy of a single quantum 'E' is directly proportional to its frequency 'ν', as described by the equation $E=h\nu$, where 'h' is Planck's constant, (h=6.626x10^-34Js). This theory resolved the "Ultraviolet Catastrophe" in classical physics by providing a successful model for blackbody radiation and is considered a fundamental principle of quantum mechanics. Planck's quantum theory began with a simple but groundbreaking idea: energy doesn't flow in smooth, endless waves, but instead comes in tiny, indivisible packets called quanta. While trying to explain how hot objects give off light—a problem that puzzled scientists for years. Planck realized that classical physics couldn't describe the real behavior of nature. His proposal that each packet of energy is linked to the frequency of light through the constant 'h' not only solved the blackbody radiation mystery but also opened the door to an entirely new way of thinking about the universe.

Keywords: Quanta, Planck's constant (h), Ultraviolet Catastrophe, Quantum mechanics, Frequency, Blackbody Radiation.

EVALUATING PUBLIC HEALTH RISKS ASSOCIATED WITH AIRBORNE PARTICULATE MATTER: A GAUSSIAN DISPERSION MODELING OF RICE MILLS EMISSIONS IN RURAL BANGLADESH

ABSTRACT

The rapid expansion of rice processing mills in agriculturally rich regions, Khajanagar, Kushtia, has resulted in elevated concentrations of particulate matter (PM), posing serious environmental and public health risks. This study examines the spatial distribution, dispersion behavior, and health impacts of $PM_{2.5}$ and PM_{10} across industrial and adjacent residential zones. A total of 69 sampling points were monitored using optical particle counters (OPCs) within 0–100 m (industrial) and 101–300 m (residential) distances, alongside meteorological observations. $PM_{2.5}$ concentrations in industrial areas exceeded all regulatory limits of Bangladesh, WHO, and the U.S. EPA, while PM_{10} surpassed WHO standards only within industrial zones; both fractions exceeded all benchmarks in residential areas. The Kruskal–Wallis test ($p < 0.05$) confirmed significant interzonal variation. Spatial mapping identified PM hotspots in the western and eastern industrial belts and the western residential cluster. $PM_{2.5}$ and PM_{10} were highly correlated, though their relationships with humidity and temperature were weak. Gaussian plume modeling indicated that PM_{10} dispersed and deposited over greater distances than $PM_{2.5}$ due to its size-dependent transport under prevailing winds, increasing exposure in residential zones. AirQ$^+$ health risk analysis revealed that $PM_{2.5}$ exposure contributed to 39.78% of ALRI-related mortality in children under five, while in adults (≥30 years), it accounted for 48.01% of COPD, 56.25% of IHD, and 65.05% of stroke deaths. PM_{10} posed additional risks for IHD and lung cancer, with 34.16% of lung cancer mortality linked to $PM_{2.5}$ exposure. These findings highlight the urgent need for strict emission control and policy interventions in rice-processing regions.

ABSTRACT
Traditional irrigation strategies are not satisfactory to cope with irrigation water scarcity and addressing food security issues. This sector must benefit from modern technological advances. Artificial intelligence and the Internet of things are the most promising solutions to deal with this concern; it is becoming more and more popular around the world. The integration of these technologies allows the transition from traditional irrigation systems to automatic and intelligent irrigation systems. Better management of irrigation water requirements is based on precise determination of reference evapotranspiration (ET0) value. It is pivotal parameters in the irrigation process. The aim of this work is to present smart irrigation systems based on artificial intelligence and the Internet of Things to predict ET0 values and optimize water irrigation use.
Keywords: precision agriculture, Artificial Intelligence, Internet of Things, food security, Evapotranspiration.

ROLE OF EMPATHY IN THE RELATIONSHIP BETWEEN PETS ATTACHMENT AND MENTAL HEALTH AMONG PET OWNERS.

Bakhtawar Fakhar
Department Of Psychology, Rawalpindi Women University, Rawalpindi
Umm Eman Syed
Department Of Psychology, Rawalpindi Women University, Rawalpindi

ABSTRACT

This study examines the relationship between pet attachment, empathy, and mental health among pet owners, drawing on principles from attachment theory. A quantitative co relational approach was employed with a sample of 250 pet owners (balanced by gender) from Rawalpindi and Islamabad, Pakistan. Standardized measures including the Animal Empathy Scale–Short Form (AES-SF), Lexington Attachment to Pets Scale (LAPS), and Depression, Anxiety, and Stress Scale (DASS-21) were used to assess key variables. Findings demonstrated that stronger emotional bonds with pets were associated with lower levels of depression ($r=0.27$, $p<.01$), anxiety ($r=-0.28$, $p<.01$), and stress ($r=-0.31$, $p<.01$), supporting the mental health benefits of human-animal connections. Empathy was found to enhance these benefits, particularly in mitigating stress and anxiety, suggesting that individuals with greater empathy derive more psychological support from their pets ($B=-3.40$, $P=<.05$). Demographic variations emerged, with married participants reporting higher empathy and better mental health outcomes compared to unmarried individuals. Conversely, unemployed respondents exhibited stronger pet attachment but poorer mental health, implying that pets may serve as compensatory sources of emotional support in the absence of other social resources. Gender differences were also observed, with women displaying higher levels of both empathy and pet attachment. These results highlight the potential of pet companionship as a therapeutic tool, particularly for emotionally attuned individuals. The study contributes to existing knowledge on animal-assisted support and suggests practical applications for mental health interventions. Methodological limitations, such as the cross-sectional design and geographically restricted sample, indicate a need for future longitudinal and cross-cultural research to validate and expand these findings.

Keywords: pet attachment, empathy, mental health, human-animal bond, stress, depression, anxiety, animal-assisted support, gender differences, Pakistan

MULTI-OMICS PROFILING UNVEILS UBE2C, MCM2, AURKA, AND TP53 AS CORE REGULATORY HUBS OF INTERCONNECTED ONCOGENIC NETWORKS IN WOMEN'S BREAST, OVARIAN, AND ENDOMETRIAL CANCERS

Md. Shafiqul Islam
Department of Zoology, University of Rajshahi, Rajshahi-6205, Bangladesh
Email: shafi.ru.zool@gmail.com

ABSTRACT

Breast (BRCA), ovarian (OV), and uterine corpus endometrial cancers (UCEC) exhibit well-documented epidemiological associations, yet the molecular underpinnings of their interconnected risks remain poorly defined. Leveraging multi-omics integration, this study identifies conserved pan-cancer common hub genes driving these malignancies and explores their clinical and therapeutic relevance. Transcriptomic analysis of microarray datasets (GSE18520 [ovarian cancer], GSE10797 [breast cancer], GSE7305 [UCEC]) revealed 38 common conserved differentially expressed genes (DEGs; $|\log_2 FC| > 1$, $p < 0.01$) across all three cancers. Protein-protein interaction (PPI) network analysis prioritized four central hub genes UBE2C, MCM2, AURKA, and TP53 exhibiting consistent upregulation in tumor tissues ($p< 0.01$) and significant correlations with poor overall survival (log-rank $p < 0.05$). Methylation profiling uncovered cancer-specific epigenetic dysregulation, with UBE2C hypermethylated in breast and ovarian cancers but hypomethylated in UCEC, while TP53 showed pan-cancer hypermethylation. Immune infiltration analysis revealed a correlation between common hub gene expressions and CD8+ T cell levels (ρ = -0.32 to -0.47, < 0.05), suggesting immune-evasive mechanisms. Functional enrichment linked these genes to cell cycle regulation, mitotic processes, and DNA replication. Drug prediction identified FDA-approved/investigational agents (e.g., Pamiparib, Rucaparib) targeting these hubs, with SwissADME analysis confirming favorable drug-likeness and pharmacokinetic properties.

By bridging epidemiological associations with molecular mechanisms, this study establishes UBE2C, MCM2, AURKA, and TP53 as pan-cancer drivers of gynecologic and breast malignancies, offering novel biomarkers for risk stratification and precision therapeutics. These findings advance translational strategies for patients at elevated risk of secondary cancers and underscore the potential of multi-omics frameworks in unraveling shared oncogenic networks.

SILENT SLIGHTS, BIG DECISIONS: THE MEDIATING ROLE OF SENSE OF AGENCY IN THE IMPACT OF GENDERED MICROAGGRESSIONS ON TURNOVER INTENTIONS AMONG WORKING WOMEN

Rabia Hamee
Rawalpindi Women University

Maryam Javed
Rawalpindi Women University
Aisha Zubair
National Institute of Psychology, Quaid-e-Azam University, Islamabad.

ABSTRACT

Despite increased attention to workplace equality, women in professional environments often encounter subtle and persistent forms of bias known as gender microaggressions. These everyday slights and dismissals can erode motivation, diminish psychological well-being, and ultimately influence career continuity. This study aims to explore the influence of perceived gender microaggression on turnover intentions among working women and examines whether a positive sense of agency mediate this relationship. Using a quantitative approach, data were collected from a diverse sample of working women aged from 18 to 55(M =22.48, SD =2.72) across various sector sectors through standardized questionnaires: the Microinsults and Microinvalidations Scale (Algner et al., 2022), the Turnover Intention Scale (Bothma et al., 2013), and the Sense of Agency Scale (Tapal et al., 2017). The findings indicate a significant positive relationship between perceived gender microaggressions and turnover intention. Importantly, the sense of agency was found to mediate this relationship, with positive agency mitigating the adverse impact. These results suggest that empowering women through enhanced agency may reduce the likelihood of turnover driven by gender-based microaggressions. Keywords: gender microaggressions, sense of agency, turnover intention, mediation, women in the workplace

MORPHO-ANATOMICAL, PHYSIOLOGICAL AND BIOCHEMICAL RESPONSES OF WHEAT (*Triticum aestivum* L.) VARIETIES TO DROUGHT STRESS, REWATERING, AND EXOGENOUSLY APPLICATION OF COPPER OXIDE NANOPARTICLES

Saira Malik

Department of Botany, Division of Science and Technology, University of Education, Lahore, Pakistan

Email: Sairamalik.dgk12@gmail.com

Abstract

Drought is a major constraint to crop productivity, severely affecting wheat growth and yield by disrupting morphological, physiological, and biochemical processes. This study investigated the role of exogenously application of (CuO-NPs) and rewatering in mitigating drought stress in two wheat varieties, Dilkash-20 and Nawab-20, under a completely randomized design with four treatments (control, drought, rewatering, and exogenously application of CuO-NPs. Drought stress significantly reduced plant height, biomass, relative water content, chlorophyll concentration, and nutrient uptake. Rewatering and CuO-NPs application alleviated these effects, improving growth, pigment stability, and water balance. CuO-NPs enhanced shoot and root growth and photosynthetic efficiency, contributing to better stress tolerance. Dilkash-20 exhibited higher drought tolerance and stronger response to CuO-NPs, whereas Nawab-20 showed improved recovery after rewatering. Overall, the combined use of CuO-NPs and rewatering represents a promising strategy to enhance wheat performance under water-deficit conditions.

Keywords: Wheat (*Triticum aestivum* L.), Drought stress, Rewatering, Copper oxide nanoparticles (CuO-NPs), Drought tolerance.

MICROWAVE-ASSISTED GREEN SYNTHESIS OF ZNO NANOPARTICLES USING *LITCHI CHINENSIS* LEAVES EXTRACT AND THEIR APPLICATION IN PHOTOCATALYTIC ACTIVITY

ABSTRACT

This study focuses on a simple, facile, eco-friendly, and energy-efficient method for synthesizing ZnO nanoparticles for photocatalytic activity using Litchi Chinensis leaves extract as both a reducing and stabilizing agent under microwave irradiation. The synthesis of ZnO nanoparticles using the recently developed green approach is extremely promising because of its non-toxicity and environmentally friendly behavior. The prepared ZnO NPs was characterized for their optical properties, crystallite size, morphology, elemental composition, and functional groups using UV–Vis spectroscopy, X-ray Diffraction (XRD), Scanning Electron Microscopy (SEM), Energy Dispersive X-rays (EDX), and Fourier Transform Infrared (FTIR) spectroscopy, respectively. The UV–Vis spectrum exhibited a broad peak at 374 nm with a calculated band gap of 3.33 eV. The hexagonal wurtzite crystallite size 19 nm, confirmed through XRD pattern analysis. SEM image showed the homogeneous spherical shape of ZnO nanoparticles. The EDX spectrum confirmed that the ZnO nanoparticles have high purity and are composed only of zinc and oxygen. FTIR showed absorption peaks at 664 cm^{-1}, confirming the presence of Zn-O bond. The photocatalytic activity of the ZnO NPs was evaluated against methylene blue (MB) dye under sunlight irradiation. The synthesized ZnO nanoparticles demonstrated promising photocatalytic activity under natural sunlight, achieving a maximum degradation efficiency of 98% for Methylene Blue dye. The process exhibited an adsorption capacity of 49.4 mg/g and followed a first-order kinetic model. Finally, the simplicity of the synthesis method and the performance evaluation of the ZnO nanoparticles indicate that an efficient and cost-effective adsorbent for MB recovery from aqueous solution has been successfully prepared.

ABSTRACT

The argan tree (*Argania spinosa* L.), endemic to Morocco, is a valuable economic and ecological resource. Our research project aims to enhance the valorization of its different parts by studying the influence of origin, morphology, extraction methods, and transformation processes on their chemical composition and quality. In the first phase, we compared six newly registered varieties by INRA with six well-known wild forms to identify the most profitable morphotype in terms of oil yield and quality. Subsequently, we assessed the impact of various extraction techniques, including traditional artisanal methods and mechanical pressing, particularly focusing on the oxidation kinetics of argan oil destined for both food and cosmetic uses. We also compared the oxidative stability of argan oil with that of other vegetable oils such as cactus seed oil and olive oil. Regarding transformation processes, our study investigated the effects of plasma treatment, blending, physical refining, ultrasonic bleaching, oleogelation, and emulsification on the physicochemical and functional properties of argan oil. The results obtained will contribute to optimizing the valorization of this iconic resource according to industrial and market requirements. The analyses carried out throughout most of these studies included proximal composition, mineral content, phenolic compounds, and antioxidant activities, along with quality indices, oxidative stability parameters, and detailed profiling of fatty acids, tocopherols, and sterols. In addition, extensive statistical analyses were performed to better understand the influence of each factor and to identify significant patterns and correlations. The results revealed that each factor whether related to morphology, extraction method, or transformation process offers both advantages and limitations. Therefore, an optimization and fine-tuning approach is necessary at each stage to achieve the best balance between quality, yield, and functional properties according to the targeted application.

Keywords: Argania spinosa, argan oil, morphological, extraction methods, oxidative stability, valorization

IMPACT OF RAINFALL VARIABILITY ON GROUNDWATER RECHARGE IN NORTHWESTERN BANGLADESH: A CASE STUDY OF RAJSHAHI, CHAPAINAWABGANJ AND NOAGAON

ABSTRACT

This study looks at how changing rainfall over the last thirty years has affected groundwater recharge in Rajshahi, Chapainawabganj and Nagaon. People in these areas depend heavily on groundwater, mainly for irrigation, and many have noticed that rainfall has become irregular while groundwater levels keep dropping each year. To understand this situation, I looked at rainfall and groundwater data from 1995 to 2025. The goal was to see how rainfall has changed, how groundwater levels have responded, and how closely these two are connected. The study also wanted to find out why groundwater recharge is decreasing and what this could mean in the future. Rainfall is becoming unpredictable. Long dry periods happen more often, followed by short, heavy rains. Because of this, water cannot soak into the ground properly. At the same time, farmers are using more groundwater. As a result, groundwater levels are falling. This is causing problems for farming, drinking water, and water security. If it continues, water shortages may get worse. Possible solutions include collecting rainwater, using surface water, planting crops that need less water, and managing groundwater better. Overall, rainfall changes affect groundwater and knowing this is important for future water planning in northwestern Bangladesh.

ABSTRACT

Objective: To evaluate the neuroprotection of *Syzygium aromaticum* (also known as clove) against iron and lead co-exposure in Harwich strain *Drosophila melanogaster*. *Methods*: Adult *Drosophila melanogaster* were randomly assigned into six groups: control, clove only, iron only, lead only, iron + lead, and iron + lead + clove. Flies were treated via diet supplementation for seven days. Neurobehavioral tests (e.g., negative geotaxis, phototaxis, and chemotaxis) were carried out to qualitatively assess motor activity, sensory response, and feeding behavior of flies. Following the completion of tests, brain tissues were isolated and visually assessed histologically for evidence of neurodegenerative changes. *Result*: *Drosophila melanogaster* exposed to iron and lead, relative to controls, exhibited significant deficits in climbing performance, light response, and food-seeking behavior following total co-exposure. This was coupled with histological evidence of neurodegeneration, such as neuronal vacuolization and evidence of tissue disorganization. Supplementation with clove extract significantly improved behavioral performance and preserved brain histoarchitecture, for instance, it reduced neuroinflammation and oxidative damage. *Conclusions*: *Syzygium aromaticum* extract has important neuroprotective characteristics against iron and lead-induced neurotoxicity in *Drosophila melanogaster*, likely operating through antioxidant, anti-inflammatory, and neuro-cellular protective actions.

ABSTRACT

Large Language Models (LLMs) are increasingly deployed in cybersecurity applications, from cyber threat intelligence analysis to malware detection and network anomaly explanation. While recent research has focused on jailbreaking attacks that bypass safety alignments through prompt manipulation, a more insidious threat remains largely unexplored: backdoor attacks that persist through model training, fine-tuning, and deployment. Unlike jailbreaking, which requires adversarial prompts at inference time, backdoor attacks embed hidden triggers during training that activate malicious behaviors even in production systems with robust safety measures. This study suggests a methodical examination of backdoor vulnerabilities in LLM-based cybersecurity systems, integrating conventional network intrusion detection with contemporary LLM architectures. Building on Prof. Zhengwei's pioneering work on LLM jailbreaking (ESORICS 2024), this research identifies a critical gap: while jailbreaking can be detected and filtered, backdoors remain undetectable until triggered, posing severe risks to critical security infrastructure. We propose: (1) a novel threat model for backdoor attacks in cybersecurity LLMs, (2) theoretical analysis of backdoor persistence across fine-tuning stages, (3) lightweight detection mechanisms suitable for production deployment, and (4) comprehensive evaluation on real-world cyber threat intelligence systems.

ABSTRACT

Introduction: Ethiopia, known for its huge ethnobotanical heritage, hosts a diverse flora widely utilized in traditional medicine. This capital of indigenous knowledge has contributed to the documentation of different medicinal plants used to treat a variety of ailments. Method: A systematic review was conducted using electronic databases, namely PubMed, Scopus, Web of Science, and Google Scholar to identify medicinal plants used in Ethiopia and to analyze their phytochemical profiles and antioxidant activities. Peer-reviewed studies that reported qualitative and quantitative phytochemical and antioxidant potential were selected. Result: This systematic review identified 73 medicinal plant species with documented therapeutic applications in Ethiopia, of which quantitative and qualitative phytochemical analysis were made for53 and 20 plants species, respectively. Additionally, 23 of the medicinal plants were found to be edible. The main phytochemicals identified include alkaloids, flavonoids, phenols, terpenoids, saponins, and tannins. A total of 53 plant species were found to have antioxidant potential. The frequently studied species were Echinops kebericho, Moringa oleifera, Rhamnus prinoides, Hagenia abyssinica, Coffea arabica, Nigella sativa, Vernonia amygdalina, and Acacia abyssinica. These species had extensive phytochemicals and antioxidant activity. Discussion: The antioxidant activity of Ethiopian medicinal plants has several health benefits in humans. In addition to the 23 commonly consumed plant species, the therapeutic relevance of the remaining 50 non-edible species is significant due to their bioactive compounds/phytochemicals. The occurrence of various phytochemicals resulted in diverse biological activities, including anti-inflammatory, antimicrobial, and antioxidant effects. Conclusion: This systematic review showed the rich phytochemical and high antioxidant potential of Ethiopian medicinal plants. The review compiled the chemical composition and antioxidant role of several medicinal plants. However, further investigation on identification, isolation of active phytochemicals and importance of preserving the traditional knowledge systems is suggested. Keywords: Antioxidant, Bioactive Compounds, Medicinal Plants, Phytochemical Screening

INVESTIGATION OF SALTWATER BATTERIES AS AN ALTERNATIVE ENERGY STORAGE SOLUTION IN ERITREA

ABSTRACT

The global energy landscape is rapidly evolving, with increasing emphasis on sustainable andrenewable energy solutions. Energy storage remains a critical component in this transition, particularlyfor developing nations like Eritrea. This study explores the viability of saltwater batteries as analternative energy storage system, focusing on their application in Eritrea's unique socio-economic and environmental context. Salt water batteries are batteries used to store electricity for future use of concentrated saline or salt water solutions to capture electricity for future use. This stored electricity is used later to power up gadgets that run on electricity. A saltwater battery was constructed using a copper (Cu) cathode, an aluminium (Al) anode, and an electrolyte composed of 436 grams ofiodized salt dissolved in 5.28 Liters of water.A second battery comprising of seawater electrolytedirectly from the Red Sea is also used for testing. The experimental setup of the saltwater electrolyte yielded a voltage output of 0.66 volts per cell while the other one containing 0.71 volts yielded avoltage output of 0.71 volts, demonstrating the potential of this technology for small-scale energystorage. The research evaluates the electrochemical performance, scalability, cost-effectiveness, and environmental impact of saltwater batteries, comparing them to conventional storage technologies such as lead-acid and lithium-ion batteries. The findings suggest that saltwater batteries offer a promising decentralized energy storage solution, particularly for off-grid solar applications in Eritrea. Their simplicity, low cost, and use of non-toxic materials make them suitable for rural electrification and emergency power backup. However, challenges such as lower energy density and electrode corrosion must be addressed to enhance their practicality. With further professional research various steps can be taken toward decreasing its limitations. Namely, an electrode pair as well as electrolyte solution that will contribute a better redox reaction thus higher output. This study provides a comprehensive analysis of saltwater battery technology, its potential applications in Eritrea, and recommendations for future research and policy implementation. The results contribute to the broader discourse on sustainable energy solutions for developing nations, emphasizing affordability, scalability, and environmental sustainability.

ABSTRACT

This study examined the mediating role of digital identity in the relationship between social media addiction and self-esteem among young social media users. A purposive sample of (*N=300*) participants (150 men and 150 women), aged 18 to 30 years, was recruited from colleges and universities in Rawalpindi and Islamabad. Data were collected from the sample via a demographic form and three questionnaires, each for one study variable. Social Media Addiction Scale (Andreasen et al., 2016), Digital Identity Scale (Kavut, 2020), and Rosenberg Self-Esteem Scale (Rosenberg, 1965). Data analysis involved descriptive statistics, Pearson correlation, regression, and mediation analysis using Hayes' PROCESS macro. Additionally, *t*-test and ANOVA were applied to study the effects of demographics on the study variables. The findings showed significant positive relationships between social media addiction, digital identity, and self-esteem. Mediation analysis confirmed that digital identity fully mediated the effect of social media addiction on self-esteem. No significant differences were found in the main variables across gender or education level. These results emphasized the crucial role of digital identity in shaping self-esteem among social media users. Developing a strong digital identity may serve as a key factor in mitigating the adverse impact of social media addiction on self-esteem.

ABSTRACT
Recently, Supercritical Water Gasification (SCWG) and Supercritical Water Oxidation (SCWO) technologies are rapidly advancing as promising solutions for solid & liquid waste management. We conducted a systematic review on various feedstocks (sewage sludge, oily sludge, industrial waste, biomass, animal wastes, and pharmaceutical effluents), using multiple types of catalysts (alkaline, Ni-Mo, Ru-based & hybrid), and the scale-up challenges together. The methodology used in this review paper follows the PRISMA guidelines, including literature search, inclusion and exclusion criteria, and content analysis. The dataset for this systematic review paper particularly selects journal articles on either SCWG or SCWO published between 2020 and 2025, resulting in 86 papers after screening and excluding irrelevant ones. The findings underscore the critical need for scalable, durable catalysts and reactor design that will address waste issues. This integration of SCWO and SCWG is highly feasible for destruction and energy recovery from waste. Partial advancements include modular heater design, ultrasonic descaling, autothermal operation using methane and ethanol co-fuel, and salt recovery modelling. It will be possible to take this technology to a sustainable and commercial level through low-cost and long-life catalysts, real-time salt control, and hybrid SCWG-SCWO coupling.

ABSTRACT

This study aims to design, hemisynthesize, characterize, and computationally evaluate new totarol–oxazole derivatives with potential anticancer properties. Totarol is a phenolic abietane diterpenoid naturally found in Tetraclinis articulata, and several studies have reported its significant biological activities, including cytotoxic effects against cancer cells (Li et al., 2019). To improve its pharmacological value, oxazole units will be introduced into the totarol structure, as oxazole-containing molecules are well known for their anticancer potential (Zhang et al., 2023). Totarol will be isolated and characterized using standard spectroscopic techniques. Hemisynthesis reactions will then be carried out to obtain new totarol–oxazole derivatives. Their cytotoxicity will be evaluated on selected human cancer cell lines, while molecular docking and molecular dynamics simulations will be used to investigate their interactions with relevant biological targets. The objective of this research is to valorize T. articulata sawdust, an underexploited natural resource, while contributing to the development of more effective and less toxic anticancer agents. By combining experimental methods with computational approaches, this work offers a sustainable and innovative pathway for discovering new bioactive molecules.

Keywords: Abietane diterpenes, Totarol- oxazole, Molecular docking, Cytotoxic activity.

ABSTRACT

Snake envenomation is a major global public health concern, with an estimated 5 million bites and 150,000 deaths annually. In Morocco, viper bites—mainly from *Cerastes cerastes* and *Daboia mauritanica*, cause significant morbidity and mortality. These venoms are complex mixtures of metalloproteinases, serine proteases, disintegrins, and lectins, capable of inducing severe hemorrhage and coagulopathy. This study aimed to characterize the hemorrhagic activity, minimum hemorrhagic dose (MHD), and hemostatic effects of *C. cerastes* and *D. mauritanica* venoms in mice. Venoms were collected, centrifuged, lyophilized, and protein concentrations were determined using a NanoDrop spectrophotometer. DL50 was assessed via intraperitoneal injection in Swiss mice (18–20 g). Hemorrhagic lesions were measured 2 hours post-injection, and hemostatic parameters including prothrombin time (PT), activated partial thromboplastin time (aPTT), fibrinogen levels, and platelet counts were evaluated. *Cerastes cerastes* venom exhibited higher systemic toxicity (DL50: 1.25 µg/mouse vs 2.10 µg/mouse), stronger local hemorrhagic activity (MHD: 0.128 µg/mouse vs 0.63 µg/mouse), and more pronounced coagulation disturbances than *D. mauritanica*. Proteomic analysis indicates that these differences are due to higher P-III metalloproteinase and serine protease content in *C. cerastes*. Our findings correlate with clinical observations in Morocco, confirming *C. cerastes* envenomation as more severe. The study provides mechanistic insights into venom-induced hemorrhage, supporting early clinical intervention and targeted antivenom development.

Keywords: *Cerastes cerastes*, *Daboia mauritanica*, snakebite, viper envenomation, hemorrhage activity, coagulopathy disorders, minimum hemorrhagic dose (MHD), LD_{50}

EXPLORING THE IMPACT OF THE 3 ZERO MOVEMENT IN BANGLADESH: A PATHWAY TO SUSTAINABLE DEVELOPMENT

Minhajul Abedin
Undergraduate Student, Department of Applied Mathematics
Noakhali Science and Technology University, Bangladesh.
Email: minhajul0616@student.nstu.edu.bd

ABSTRACT

Bangladesh is growing fast in terms of its economy and population, and that's making things tricky. The country has to figure out how to grow without messing things up for the future. They've made headway in some important areas so far, like health and education. But there are still problems like poverty, not enough jobs, and damage to the environment that could cause trouble later on. That’s why this research is looking at the 3 Zero Movement, which is all about getting to zero poverty, zero unemployment, and zero carbon emissions, in order to deal with these linked issues. This piece will see how well the current projects under the 3 Zero Movement are doing in Bangladesh. It will use numbers on things like poverty reduction and job creation, mixed with reviews of environmental rules. The point is to see what's missing, what's stopping things from working better, and how the different parts of the movement fit together. The hope is to come up with some advice that can help make things better on a practical level. By checking out the 3 Zero Movement, this research wants to give helpful advice to leaders, aid workers, and researchers. Basically anyone who's helping Bangladesh can build a sustainable future.

ÖZET
Çevrim içi alışveriş platformları, kullanıcıların ürün deneyimlerini paylaştıkları ve müşteri memnuniyetini yansıtan önemli veri kaynakları haline gelmiştir. Bu çalışmada, 2500 çevrim içi ürün yorumu üzerinde duygu analizi gerçekleştirilmiş ve yorum içeriklerinden yola çıkarak verilen 1–5 yıldız puanlarının makine öğrenmesi yöntemleriyle tahmin edilmesi amaçlanmıştır. Araştırmada Lojistik Regresyon (Logistic Regression), Naive Bayes, Rastgele Orman (Random Forest), Destek Vektör Makineleri (Support Vector Machines, SVM), K-En Yakın Komşular (K-Nearest Neighbors, KNN), Karar Ağacı (Decision Tree), Gradyan Güçlendirme (Gradient Boosting), XGBoost (Extreme Gradient Boosting), LightGBM (Light Gradient Boosting Machine) ve CatBoost (Categorical Boosting) olmak üzere toplam 10 farklı algoritma kullanılmıştır. Modeller, temel ön işleme adımları ile hazırlanmış veri üzerinde eğitilmiş ve çok sınıflı yapı kapsamında değerlendirilmiştir. Elde edilen sonuçlar doğruluk, kesinlik, duyarlılık ve F1-skoru metrikleri açısından karşılaştırılmış, en yüksek doğruluk oranının Lojistik Regresyon modelinde elde edildiği belirlenmiştir. Bu çalışma, Türkçe e-ticaret yorumları üzerinde çok sınıflı duygu analizi gerçekleştirmesi bakımından literatüre özgün bir katkı sağlamaktadır. Bulgular, kullanıcı yorumlarının makine öğrenmesi yöntemleriyle etkin bir biçimde işlenebildiğini ve müşteri memnuniyetinin güvenilir şekilde değerlendirilebileceğini göstermektedir. Ayrıca çalışma, mobilya ürünleri özelinde yapılan incelemeler sayesinde, tüketici tercihlerini daha doğru öngörmeye ve işletmelerin ürün geliştirme stratejilerini şekillendirmeye yönelik somut katkılar sağlamaktadır**.**

SENTIMENT ANALYSIS AND RATING PREDICTION IN E-COMMERCE FURNITURE REVIEWS

ABSTRACT

Online shopping platforms have emerged as significant data sources where users share product experiences and reflect customer satisfaction. In this study, sentiment analysis was conducted on 2,500 online product reviews with the objective of predicting 1–5 star ratings based on the review contents using machine learning methods. Ten different algorithms were employed, including Logistic Regression, Naive Bayes, Random Forest, Support Vector Machines (SVM), K-Nearest Neighbors (KNN), Decision Tree, Gradient Boosting, XGBoost (Extreme Gradient Boosting), LightGBM (Light Gradient Boosting Machine), and CatBoost (Categorical Boosting). The models were trained on preprocessed data and evaluated within a multi-class classification framework. The results were compared in terms of accuracy, precision, recall, and F1-score metrics, indicating that the Logistic Regression model achieved the highest accuracy. This study makes an original contribution to the literature by conducting multi-class sentiment analysis on Turkish e-commerce reviews. The findings demonstrate that user reviews can be effectively processed using machine learning methods and that customer satisfaction can be reliably assessed. Moreover, the focus on furniture products provides concrete insights into predicting consumer preferences more accurately and shaping product development strategies for businesses.

Keywords: sentiment analysis, machine learning, natural language processing (NLP), e-commerce platforms, classification algorithms

ABSTRACT

Physics-Informed Neural Networks (PINNs) have emerged as a promising mesh-free approach for solving partial differential equations (PDEs), offering significant potential in high-dimensional and complex domains where classical solvers face limitations. Despite notable empirical successes, the theoretical understanding of PINNs remains incomplete, particularly regarding generalization error, stability, and the role of boundary penalization. This paper provides a comprehensive error analysis of PINNs with adaptive boundary penalization, addressing critical gaps in the existing literature. We first derive non-asymptotic generalization bounds for PINNs by leveraging Rademacher complexity in both Sobolev and Barron spaces, thereby linking statistical learning theory with PDE analysis. Sharp approximation rates are established for ReLU networks, demonstrating polylogarithmic growth in network size relative to the desired accuracy. Unlike prior work, we explicitly incorporate optimization residuals, quantifying how incomplete training influences the final solution accuracy. A key contribution is the introduction of an adaptive strategy for the boundary penalty parameter β, formalized in Lemma 5, which provably minimizes boundary mismatch by scaling β with the ratio of interior to boundary residuals. Stability results (Lemma 6) further show that under coercivity assumptions, the PDE error is controlled by the PINN residual and boundary mismatch, culminating in a sharp energy-norm error bound.

ABSTRACT

Fractional order differential equations have become an indispensable tool for representing complex physical, biological, engineering and information-processing phenomena. Their ability to describe memory-dependent and hereditary processes provides a substantial advantage over classical integer-order models, enabling more realistic and flexible mathematical formulations. Among these, fractional pantograph-type differential equations form an important subclass, as they incorporate both fractional dynamics and proportional delays. Despite their significance, most linear and nonlinear pantograph problems do not admit closed-form analytical solutions, which increases the demand for efficient numerical techniques. In recent years, several approximation frameworks have been proposed to address this challenge, ranging from polynomial-based schemes to wavelet-type algorithms and transform methods. Motivated by the need for stable and accurate computations, this study develops a fractional Bessel matrix approach tailored for multi-order pantograph equations. The method relies on constructing operational matrices corresponding to derivative, delay, and fractional operators by using the structural properties of Bessel polynomials. These matrices allow the underlying differential problem to be converted into an algebraic system, significantly reducing computational complexity while preserving accuracy. In this study, the theoretical foundation of the method is supported by essential definitions and convergence analysis. A residual formulation is also introduced to assess the approximation quality and ensure consistency of the algorithm. The proposed framework is then applied to several test problems, including linear and nonlinear pantograph models with different fractional orders. Numerical experiments, together with error tables and graphical results, demonstrate the capability of the method to achieve high-precision approximations with relatively low computational cost.

Keywords : Caputo fractional derivative; Fractional Bessel polynomial; Collocation method; Linear differential equation; Nonlinear Differential equation

ÖZET

Helikopterler su üzerinde faaliyet gösterdiği operasyonlarında acil bir şekilde suya inme durumu yaşayabilirler. Acil inişlerde genellikle helikopterin kontrolü kaybedilmemiş ve manevralar hala kontrol durumundadır. Son yıllarda gerçekleşen olaylar incelendiğinde; mürettebat ve yolcuların inme gerçekleştikten sonra helikopterin alabora olması ile can kayıplarının olduğu durumlar raporlanmıştır. Suya inme durumunda helikopterlerin batmaması için acil yüzdürme sistemleri (EFS) kullanılır. Ancak EFS genellikle çarpma gerçekleştikten sonra tetiklenir ve sistemlerin açılıp tam şişmesine kadar belirli bir süre gerekir. Bu süre içerisinde helikopter suyun içinde belirli yatma açı değeri kadar döner ise EFS açılsa da helikopter alabora olabilir. Bu çalışma bir helikopterin dalgalı suya iniş karakterini ve iniş gerçekleştikten sonra alabora olma durumunu araştırır. Çalışmada helikopterin gelen dalganın farklı konumlarına çarptığı durumlar nümerik olarak incelenmiştir. Volume of Fluid (VOF) model kullanılarak hava- su iki farklı faz olarak modellenmiş ve Reynolds Averaged Navier-Stokes (RANS) denklemleri ile SST k-omega türbülans modeli kullanılarak zamana bağlı şekilde çözümlenmiştir. Modeldeki basınç, hız, ivme, konum değerleri serbest düşürülen bir kama testi çalışması ile doğrulanmış, modelin doğruluğu ise bu çalışmalar ile değerlendirilmiştir. Helikopterin farklı yatma ve sapma açılarında suya iniş gerçekleştirdiğindeki etkisi farklı parametreler özelinde incelenmiştir. EFS açılması için geçen süre göz önüne alınarak açıların alabora olma süresine etkisi de gösterilmiştir. Ayrıca helikopterin ağırlık merkezinin (CoG) de suya iniş sonrası alabora olma durumuna etkisi gösterilmiştir. Sonuçlar suya iniş açılarının ve CoG konumunun helikopterin suya inişi sonrası karakterini önemli ölçüde etkilediğini göstermiştir. Yine suya iniş konumunun da alabora süresini etkilediği belirlenmiştir. Çalışmalar ile bir helikopterin suya iniş sonrası EFS açılana kadar geçen sürede alabora olup/olmama karakteri nümerik olarak zamana bağlı şekilde modellenebilmiştir. Bu model ölçekli model testlerine göre daha ekonomik, tekrarlanabilir ve esnek bir alternatif sunmaktadır.

Anahtar Kelime: CFD, alabora, suya iniş, helikopter, VOF

NUMERICAL STUDY OF HELICOPTER DITCHING AND CAPSIZE BEHAVIOR ON WAVY WATER

ABSTRACT

Helicopters may have to land on the water/ ditching in an emergency during operations over the water. In emergency event, control of the helicopter is not lost and the maneuvers are still control. Recent incidents reveal that, after ditching there have been reports of helicopter capsizing, leading to fatalities among crew and passengers. In case of ditching, emergency flotation systems (EFS) are used to prevent the helicopter from sinking. However, the EFS are usually triggered after ditching. During this time, if the helicopter rotates in the water up a certain roll angle value, the helicopter may capsize even if the EFS are triggered. This study investigates a helicopter's ditching characteristics on wavy water, specifically focusing on the post-ditching stability and susceptibility to capsizing. In this study, the cases where the helicopter ditches different positions of the incident wave are numerically explored. The air and water domains are modelled as two phases using Volume of Fluid (VOF) model and solved using SST k-omega turbulence model with Reynolds Averaged Navier-Stokes (RANS) equations as unsteady. Pressure, velocity, acceleration, and position values within the model are validated against a free-falling wedge test study, and the model's accuracy is assessed through these comparisons. The impact of helicopter ditching at varying yaw and roll angles has been investigated through analysis of various parameters. The results show that the different roll and yaw angles and CoG position significantly influence the helicopter's capsize behavior ditching and post-ditching moment. Furthermore, it has been shown that the ditching position above the wave also affects the capsizing character. The capsizing/non-capsizing character of a helicopter after ditching in the water until the EFS are deployed can be modeled numerically as unsteady. This model is a more economical, repeatable and flexible alternative to scale testing models.

Keywords: CFD, capsize, ditching, helicopter, VOF

NUMERICAL VALIDATION OF WALL CONDENSATION PHENOMENON AND NUMERICAL ANALYSIS OF THE HELICOPTER DEMISTING PERFORMANCE

ABSTRACT
In nature, the atmospheric air contains some elements such as water vapor. When the atmospheric air contacts with a surface below the dew point temperature, wall condensation phenomena take place on the surface causing the water-vapor inside the air change from gaseous phase to liquid phase. This phenomenon is observed on the helicopter windshield as fog that can prevent pilot's vision. In order to open pilot's visibility, clean this fog by turning on demist function of the helicopter system. In this paper, to examine and optimize the adequacy of the demist function, numerical analyses were done. First of all, in order to identify the most appropriate model for solving the wall condensation phenomena among many models in the numerical analysis tools, it is necessary to numerically validate a test bench in which the heat transfer and wall condensation phenomena were studied. With the CONAN facility experimental set-up at the University of Pisa, conjugated heat transfer, mass transfer, and wall condensation phenomena were studied and have been used in the numerical validation of the CFD model. Among the models available in the literature, the Eulerian Wall Film + Species Transport model in ANSYS Fluent software gave the best results with the test results. The CFD results show that all cases are validated with experimental results below %10 error rate. Secondly, using this validation methodology, the parameters affecting the helicopter demist function were investigated.

ABSTRACT

This work presents a theoretical investigation of the cycloaddition reaction between a 4-acyl-1H-pyrrole-2,3-dione fused at the [e] side and various cyanamides, with the aim of elucidating the underlying molecular mechanisms and predicting reaction outcomes through computational methods. Using Molecular Electron Density Theory (MEDT) at the DFT/B3LYP/6-311G(d,p) level, we analyze the kinetic, thermodynamic, and stereochemical features of the cycloaddition pathway, including a detailed mechanistic study and an accurate electronic description of all stationary points along the IRC. Topological analysis of the Electron Localization Function (ELF) is applied to characterize the electronic structure of the resulting 4H-1,3-oxazines, offering a powerful interpretative framework for partitioning electron density in the product. Additionally, molecular docking is employed to predict dominant binding modes of selected ligands with target proteins, perform virtual screening, rank binding affinities, and rationalize ligand behavior. These combined approaches provide structural hypotheses for target inhibition and support lead-optimization strategies, contributing to the development of new synthetic and biological applications.

ABSTRACT
One of the pests that damage rice plants is the rice stem borer (Scirpophaga innotata), which attacks both the vegetative phase (larvae damage rice plants by eating the vascular system inside the rice plant stem called "sundep") and the generative phase (rice stem shoots become dry, yellow, white, hollow, and easy to remove). Environmentally friendly pest control is carried out using 4 types of refugia (sunflowers/Helianthus annuus; kenikir flower/Cosmos caudatus; ppae4 flower/Zinnia elegans, and krokot/Portulaca oleracea). Insects such as butterflies, ants, beetles, spiders, and bees like refugia in Pematang Kertak ricefiled, Perbaungan dostrick, Serdang Bedagai Regency, Sumatera Utara. Refugia are easy to plant, grow quickly, seeds are easy to obtain, plant regeneration is relatively fast and continuous. Refugia plants play a crucial role in sustainable rice cultivation systems. Their presence helps maintain the balance of the rice field ecosystem, supports populations of natural enemies of pests, and improves soil quality and microbial life. Their use can also reduce dependence on chemical pesticides. While further research is needed to optimize crop types and management methods in various regions, the implementation of refugia is already a concrete step towards healthier and more environmentally friendly agriculture. Refugia have the potential as integrated microhabitats for plant pest control that are environmentally friendly, low cost, and targeted.

ABSTRACT

The N-arylated benzimidazoles are important structural motifs in many biologically active compounds. Due to their unique structural and physicochemical properties, they are used in different fields, including medicinal chemistry, material sciences, and catalysis. Synthetic chemists have designed a variety of pathways to perform the efficient N-arylation of benzimidazoles. Transition metal-based catalysis has been found as a key strategy, using metals such as copper (Cu), iron (Fe), palladium (Pd), nickel (Ni), iridium (Ir), and ruthenium (Ru). These catalysts, which are supported by different types of ligands, access to the selective and efficient synthesis of N-aryl bonds under a wide range of reaction conditions. Cross-coupling reactions, such as the Chan-Lam, Ullmann, and Buchwald-Hartwig protocols, are commonly utilized due to their durability and scalability. Metal-free techniques offer environment friendly options, and multicomponent reactions gave the benefit of convergent synthesis. Microwave-assisted reactions and photocatalyzed procedures helped to improve the efficiency, selectivity, and sustainability of N-arylation reactions. The review provides a comprehensive overview of the recent advancements and strategies employed in synthesizing this important class of heterocyclic compounds, highlighting their versatility and significance.

CRISPR-ENHANCED ENGINEERING OF T CELLS FOR NEXT-GENERATION CANCER IMMUNOTHERAPY: A MOLECULAR AND SYNTHETIC BIOLOGY PERSPECTIVE

ABSTRACT

Cancer remains a major global health challenge, and despite recent advances in immunotherapy, current treatment strategies face significant limitations, particularly in solid tumors. Engineered immune cells—especially chimeric antigen receptor T cells (CAR-T)—have transformed hematological cancer therapy, yet issues such as antigen heterogeneity, inhibitory tumor microenvironments, therapy-related toxicities, and poor infiltration restrict broader clinical success. Recent developments in molecular engineering and synthetic biology now offer powerful tools to address these challenges, with CRISPR-mediated gene editing emerging as a crucial driver of enhanced precision, safety, and potency in engineered T-cell therapies. Current evidence shows that CRISPR knockout of inhibitory receptors such as PD-1 and LAG-3 increases T-cell persistence, while multiplex editing supports the development of universal allogeneic CAR-T cells capable of reducing graft-versus-host reactions. Similarly, synthetic gene circuits, logic-gated CAR constructs, engineered chemokine receptors, and cytokine rewiring strategies demonstrate improved tumor specificity, controlled activation, and enhanced infiltration into solid tumors. These findings align with rapidly growing research interests in programmable immune responses, metabolic reprogramming, and integration of computational modeling with multi-omics profiling to optimize gene-editing targets and engineering strategies. Based on reviewed advancements, recommended methodologies for future work include combining CRISPR-Cas9 systems with synthetic receptor design, employing 3D tumor spheroid models, microfluidic tumor chips, and in vivo CRISPR functional screens to evaluate engineered T-cell behavior under biologically relevant conditions. Overall, the convergence of molecular engineering and synthetic biology is enabling the creation of next-generation T-cell therapies capable of overcoming the long-standing barriers of solid tumor treatment, supporting their potential as safer, more precise, and highly customizable cancer immunotherapies.

Keywords: CAR-T cells, CRISPR-Cas9, synthetic biology, molecular engineering, tumor microenvironment, gene editing, immunotherapy, solid tumors, programmable immune cells, cancer therapy.

DATA-DRIVEN PREDICTIVE MAINTENANCE IN INDUSTRY 4.0: EVALUATION OF MACHINE LEARNING MODELS ON SYNTHETIC DATA

Mouhajar Siham*

ABSTRACT
In the context of Industry 4.0, it is essential to have an optimized system capable of detecting equipment failure in advance. For this purpose, Machine Learning models are used as decision-making approaches to address this challenge. Furthermore, a synthetic dataset was generated to validate these approaches. This dataset represents real-world industrial applications and provides data for prior estimation of machine failure based on several variables such as temperature, torque, rotational speed, and tool wear. Six Machine Learning models—Random Forest, XGBoost, Support Vector Classifier, K-Nearest Neighbors, Logistic Regression, and Multi-Layer Perceptron—were trained and compared based on their performance in predicting machine failures. The study shows that XGBoost achieved the highest accuracy of 98%, making it the most suitable model for predictive maintenance within the Industrial Internet of Things (IIoT) environment. Finally, this research demonstrates how synthetic data can enhance the development and validation of predictive maintenance solutions.
Keywords—Industrial IoT; Industry 4.0, predictive maintenance, Machine Learning

HIGH-RESOLUTION DROUGHT HOTSPOT MAPPING USING SENTINEL-BASED COMPOSITE INDICES

ABSTRACT

Drought is a recurring climatic hazard that significantly affects agricultural productivity, water resources, and rural livelihoods in northern Bangladesh. This study assesses drought conditions exclusively in the Dinajpur, a district in northern Bangladesh using high-resolution remote sensing. This research applies high-resolution Sentinel-2 data to compute the Vegetation Condition Index (VCI) for detailed agricultural drought detection. Meteorological drought was evaluated using the Standardized Precipitation Index (SPI), while hydrological drought was assessed through the Standardized Water Level Index (SWI) using groundwater observations. A Composite Drought Index (CDI) was developed by integrating all three indicators. The Local Indicators of Spatial Autocorrelation (LISA) technique was used to identify drought hotspots and cold spots within Dinajpur at a finer spatial scale. The findings reveal more localized drought variability, enabling precise drought monitoring and supporting improved agricultural planning and drought-mitigation strategies for the district.

ABSTRACT

This study evaluated the effect of storage temperature on the microbiological and physicochemical quality of a dairy dessert. The results showed that at 6 °C and 10 °C, the dessert remained stable and compliant with ISO standards, ensuring good shelf life and optimal food safety. In contrast, from 22 °C onwards, a rapid decrease in pH and an increase in acidity were observed, accompanied by the proliferation of pathogenic microorganisms such as Staphylococcus aureus and Enterobacteriaceae. Between 30 °C and 44 °C, spoilage accelerated due to microbial growth, increasing the risk of foodborne intoxications. Therefore, temperature appears to be the key factor determining product stability. Strict compliance with the cold chain, with a critical storage threshold set between 6 °C and 10 °C, is essential to guarantee the quality, safety, and regulatory compliance of the dairy dessert.

Keywords: Dairy dessert cream, Storage temperature, Microbiological quality, Physicochemical parameters, Cold chain, ISO standards.

ABSTRACT

The aim of our work is to characterize the elastic behavior of a unidirectional glass fiber reinforced composite laminate with a 60% volume fraction of epoxy resin matrix E. The determination of the elastic constants of the specifically orthotropic composite laminate is estimated using the rule of mixtures, and macro-mechanical studies have allowed us to determine the evolution of elastic constants based on fiber orientation and calculate the variation of thermo elastic quantities according to fiber orientation. Under the combined effect of mechanical stresses and temperature variations, the overall thermomechanical deformations of the unidirectional laminate will be determined by introducing longitudinal and transverse thermal expansions of the composite.

Keywords: Unidirectional composite laminate, thermo elastic behavior, fiber orientation

ESTIMATION OF THE STATE OF CHARGE AND HEALTH OF A LITHIUM-POLYMER BATTERY USING ULTRASONIC TECHNOLOGY

ABSTRACT

The current era is characterized by the growing need for portable electronic systems, leading to a high demand for compact and efficient energy storage solutions. Lithium-ion batteries, particularly lithium-polymer (LiPo) cells, have emerged as a leading technology due to their high energy density and lightweight structure. However, their safe and optimal operation requires precise monitoring, typically ensured through a Battery Management System (BMS). This paper focuses on the non-destructive estimation of the State of Charge (SOC) and State of Health (SOH) of a LiPo cell using ultrasonic methods. After a detailed study of ultrasonic wave propagation and its interaction with electrochemical materials, an experimental protocol was developed to track changes in Time of Flight (TOF) and signal amplitude during battery discharge cycles. The results show a strong correlation between the acoustic parameters and the internal state of the cell, paving the way for a novel, non-invasive diagnostic technique that enables real-time monitoring without disturbing normal battery operation.

Keywords: LiPo Battery, SOC, SOH, Ultrasound, Time of Flight, Attenuation, Non-destructive method

DECARBONIZING OUR ENVIRONMENT: ADVANCING SUSTAINABLE DEVELOPMENT THROUGH POLICIES AND STRATEGIES

ABSTRACT

Decarbonization is a pivotal strategy for combating climate change and achieving global sustainability objectives. This research paper explores the multifaceted approaches necessary to reduce carbon emissions across key sectors by harnessing cutting-edge technologies, maximizing energy efficiency, and driving the transition to renewable energy sources. The study highlights the critical role of decarbonization in justifying the adverse impact of climate change, global warming and ecological degradation while advancing sustainable development goals. Through a comprehensive analysis of technological advancements and policies, the paper identifies effective strategies and actionable solutions for minimizing carbon emissions. It emphasizes the importance of integrating support for policy, technological advancements, and teamwork to contribute to major decreases in carbon footprints. By examining best practices and recommending future research directions, this study seeks to add to the important global decarbonization conversation while promoting environmental stewardship. This paper serves as an important resource for policymakers, researchers, and stakeholders, providing insight into the attainment of a sustainable and resilient future through the implementation of comprehensive decarbonization policies and strategies.

Maimuna Akter Koli
Department of Entomology, Faculty of Agriculture, Bangladesh Agricultural University, Mymensingh 2202, Bangladesh

ABSTRACT

The Angoumois grain moth (*Sitotroga cerealella*) poses a significant threat to stored grains, leading to considerable post-harvest losses on a global scale. This study evaluates the efficacy of six botanical treatments: *Codiaeum variegatum, Calendula officinalis, Allium sativum, Mentha piperita, Cymbopogon citratus*, and *Nephrolepis exaltata* against *S. cerealella* infestations in stored rice under controlled laboratory conditions. The experiment was carried out using a completely randomized design with six replications. The impact of the treatments on oviposition, egg hatching, larval mortality, pupal mortality, adult emergence, and percentage of damage was evaluated. The study shows that *Allium sativum* demonstrates superior effectiveness, achieving the highest pupal mortality rate (13.8%) and the lowest adult emergence (12.6%) compared to all other treatments. Notably, treatment with garlic resulted in an impressive 84% reduction in grain damage relative to the control, significantly outpacing the second most effective treatment, *Calendula officinalis*, which achieved a 61.5% reduction. These results underscore the potent insecticidal properties of garlic, attributed primarily to its active components, diallyl disulfide and diallyl trisulfide. The study compellingly supports the proposition that *Allium sativum* is a promising environmentally friendly alternative to conventional chemical pesticides for managing *S. cerealella* infestations in stored grains. This aligns with the growing demand for sustainable agricultural practices and food safety measures, positioning garlic as a viable solution to mitigate post-harvest losses in the grain storage sector.
Keywords: *Allium sativum*, botanical treatments, *Oryza sativa*, *Sitotroga cerealella*, stored grains, eco-friendly pest management.

INVESTIGATION OF THE THERMOELECTRIC PROPERTIES OF TWO-DIMENSIONAL JANUS MATERIALS

Saida Es-Sanhajy

Email: s.essanhajy@edu.umi.ac.ma
Pr. Mourad Boughrara
Physics, Moulay Ismail University Faculty of Sciences, Meknes, Morocco

ABSTRACT

First-principles calculations based on density functional theory (DFT) were carried out to explore the electronic and thermoelectric properties of 2H-phase molybdenum dichalcogenides MoQ_2 (Q = S, Se) along with their hypothetical mixed-layer heterostructure. Owing to the electronegativity contrast between sulfur (S) and selenium (Se), the formation of the mixed-layer $MoS_2/MoSe_2$ compound enables effective modulation of the electronic band structure. The results reveal that pristine MoS_2 and $MoSe_2$ possess indirect band gaps, whereas the mixed-layer $MoS_2/MoSe_2$ heterostructure exhibits a transition toward a pseudo-direct band gap, similar to the electronic behavior typically observed in monolayer MoQ_2 systems. This alteration in band-gap character has a marked impact on the electronic transport properties. Moreover, interlayer mixing significantly enhances the thermoelectric response by increasing the electronic density of states around the Fermi level and narrowing the band gap—two factors that promote higher carrier concentrations and lead to improved power factors. Overall, this study shows that layer mixing provides an efficient strategy for tailoring the electronic band structure of transition metal dichalcogenides and for optimizing their thermoelectric performance.

Keywords: MoS_2, $MoSe_2$, $MoS_2/MoSe_2$, Density functional theory (DFT), Electronic band gap, Thermoelectric properties.

EXTRACTION OF PECTIN BIOPOLYMER FROM JACKFRUIT PEEL: A REVIEW

Y. Navyasree

ABSTRACT
Jackfruit (Artocarpus heterophyllus) peel, a major agro-industrial residue, offers an underutilized yet promising source of pectin — a biodegradable polysaccharide valued for its gelling, stabilizing, and film-forming properties. This review compiles recent progress in the extraction, optimization, and characterization of pectin derived from jackfruit peel waste. Conventional acid extraction remains the most prevalent approach, typically using mineral or organic acids under temperatures of 80–95 °C and pH ranges between 1.5 and 2.5. Pretreatments such as convective drying and blanching substantially affect yield (5–16%) and quality parameters including degree of esterification and galacturonic acid content. Optimization through response surface methodology has further enhanced recovery, with yields reported up to 38%. In recent years, emerging green extraction technologies have shown superior efficiency and sustainability. Ultrasound-assisted extraction (UAE) and microwave-assisted extraction (MAE) reduce processing time, improve diffusion, and yield high-quality low-methoxyl pectin with better antioxidant activity. Radio-frequency-assisted extraction (RFAE) has achieved even higher yields and degrees of esterification, suggesting potential for high-methoxyl pectin production. These innovative methods minimize chemical consumption and energy use while preserving functional integrity. Overall, extraction parameters such as acid concentration, pH, temperature, pretreatment, and technique strongly influence pectin yield and composition. Transitioning toward eco-friendly, energy-efficient extraction supports sustainable utilization of jackfruit peel waste. Jackfruit peel thus emerges as a renewable source for pectin biopolymer production, offering broad applications in food, pharmaceuticals, and biodegradable materials. Keywords: Jackfruit peel, pectin, acid extraction, ultrasound, microwave, radio frequency, biopolymer.

FEASIBILITY OF USING RICE STRAW BALE AS A WALLING MATERIAL FOR SUSTAINABLE AND AFFORDABLE LOW INCOME MASS HOUSING IN GOMBE METROPOLIS, NIGERIA

ABSTRACT

The escalation in the cost of conventional construction materials, compounded by prolonged insurgency in North Eastern Nigeria, has significantly exacerbated the housing scarcity prevalent in Gombe State. Factors influencing housing deficit in the region include rapid population growth, urbanization, migration from neighbouring states affected by insurgency, and insufficient investment in the housing sector. The building industry consumes approximately 40% of the world's total energy which is unsustainable. Straw bale as a sustainable and affordable material is therefore considered as an ideal building *material* because of its renewable nature and low environmental impact with a rich history of utilization in North America, Europe and Asia. Although it remains largely underutilized in Nigeria, often disposed by open burning which exacerbates to the challenges of climate change in the built environment. Gombe State, emerging as a significant player in the rice production industry with an annual production capacity of over 140,107 metric tonnes, stands to leverage rice straw bale as a construction material, which would enhance housing sustainability and affordability within the region. Qualitative research approach was adopted for this study and data were collected through face to face interview. Thematic analysis was adopted to interpret the data, from the findings. 25 persons across the three categories of the participants (Civil Servants, Farmers and Professionals in the building industry) are of the opinion that straw bale is an affordable building material than conventional building material with 4 participants having the opinion of choosing conventional building materials to be more affordable and more accessible than straw bale, while 1 person did not make comment. This research also found 19 out of the 30 interviewees are of the opinion of building with straw bale as a walling material stating reasons such as: local material availability, sustainability, insulation, cost savings, and potential economic development as the major benefits of using straw bale as a construction material. However, concerns for inadequate awareness, scarcity of skilled professionals and artisans, funding constraints, susceptibility to termite infestation, fire rating, durability, public

acceptance, weather resistance, adherence to building codes, and aesthetic considerations were identified as challenges for the adoption and application of straw bale. In conclusion, this research suggest the treating the straw bales using sodium borate also known as borax powder or used engine oil to prevent termite infestations, mixing of breathable stucco such as clay with lime in plastering to assist in achieving indoor air quality (IAQ) and prevention of plant sprout from the bales, organising multi-media workshops, trainings and issuing certification such as Breeam, Leeds can also aid in creating public awareness on using straw bale as a walling material. Additionally, involvement of private sector stakeholders, estate developers, policy makers and robust research efforts on affordability, applicability and sustainability of straw bale is emphasized.

Keywords: Climate Change, Indoor air quality, Sustainable building material, Straw bale

ABSTRACT

Afrocentric architecture represents a decolonial paradigm that centers African cultural, spiritual, and environmental principles in contemporary design, countering Eurocentric dominance in architectural theory and practice. Rooted in Afrocentricity, it emphasizes indigenous technologies, climatic responsiveness, and cultural symbolism to foster sustainable, context-sensitive built environments. Despite its promise for epistemic reclamation and pan-African unity, the field is plagued by profound geographical imbalances, with research predominantly concentrated in West and Southern Africa due to established academic infrastructures, colonial legacies, and funding disparities. This bias fragments the discourse, neglecting vibrant traditions in Central, East, and North Africa, such as Nubian vaults, Swahili coral-stone houses, and Congolese earth structures, thereby limiting a comprehensive continental framework. This study addresses this critical gap through a PRISMA-guided systematic literature review and bibliometric analysis of Afrocentric architectural research from 2015 to 2025. Using Google Scholar, a Boolean search strategy identified 20,306 initial articles, refined to 139 relevant peer-reviewed publications based on inclusion criteria focusing on English-language studies in built environment fields with geographical context. Data extraction included authorship, affiliations, countries of origin, and publication trends, analyzed via network mapping and density visualizations to quantify regional representation. Results reveal a stark West/South dominance, with West Africa contributing 55 outputs (e.g., Nigeria: 42) and Southern Africa 53 (e.g., South Africa: 51), while East Africa (12), Central Africa (2), and North Africa (1) remain severely underrepresented. Diaspora contributions (16) from the U.S.,

U.K., and Europe underscore external epistemic influence. Publication trends peaked at 26 in 2020, reflecting growing decolonial interest, but declined thereafter, highlighting data limitations and uneven methodological approaches across regions. These findings expose structural inequalities that hinder theoretical integration, sustainability discourse, and architectural education, perpetuating epistemic injustice. By mapping biases, the study advocates for equitable interventions to achieve a truly inclusive Afrocentric paradigm. Recommendations include multilingual bibliometric databases, intra-African collaborations, open-access platforms, targeted funding for underrepresented regions, and curriculum diversification to incorporate diverse case studies. Ultimately, addressing geographical bias is essential for redefining Afrocentric architecture as a unified, representative continental narrative that honors Africa's full cultural and environmental spectrum.

Keywords: Afrocentric architecture, geographical bias, bibliometric analysis, decolonization, epistemic equity

ABSTRACT

This study reports the successful synthesis of a sesquiterpenic alcohol ($C_{15}H_{26}O$) via the hydroboration–oxidation of (R)-α-trans-himachalene using 9-borabicyclo[3.3.1]nonane (9-BBN) followed by oxidative workup with H_2O_2/OH^- in tetrahydrofuran. The chemoselectivity of this transformation was investigated through a combined experimental and theoretical approach. Density Functional Theory (DFT)-based Molecular Electron Density Theory (MEDT) analyses, including Parr's electrophilicity and nucleophilicity indices, electron

localization function (ELF) topological studies, and activation energy calculations, were employed to rationalize the observed regioselectivity. Theoretical predictions aligned well with experimental outcomes, confirming preferential attack at the less substituted double bond of α-trans-himachalene. Notably, solvent effect studies revealed significantly lower activation barriers in water and ethanol compared to traditional organic solvents, highlighting the feasibility of conducting this reaction under greener, more sustainable conditions. Mechanistic insights indicate a concerted yet asynchronous hydroboration pathway, characterized by uneven bond formation during the transition state. Furthermore, molecular docking simulations were performed to evaluate the potential biological activity of the synthesized alcohol isomers (P"1 and P"2). Docking against human Topoisomerase II (PDB: 1ZXM) and Tubulin (PDB: 1SA0)—using etoposide and paclitaxel as reference inhibitors—demonstrated promising binding affinities and interaction profiles. These results suggest that the derived alcohols warrant further investigation as potential anticancer agents.

Keywords: hydroboration-oxidation, MEDT, ELF, α-trans-himachalene, activation energy.

DESIGN OF AN ARTIFICIAL NEURAL NETWORK-BASED DECISION SUPPORT SYSTEM FOR FORENSIC INFORMATICS APPLICATIONS

ABSTRACT

One of the major factors that profoundly disrupt historical and social order is the phenomenon of terrorism. Terrorist acts not only result in loss of life but also place significant strain on countries' economic resources, infrastructure investments, and security budgets. Therefore, counterterrorism has become one of the core components of national security policies for many states. On the other hand, rapid advancements in information technologies have enabled the use of applications capable of supporting decision-making processes and generating future predictions across various fields such as health, economy, security, and intelligence. In this study, an artificial neural network–based classification model was designed using the Global Terrorism Database to predict which organization may have carried out a given terrorist attack and to support the deepening of the investigation process in this direction. To ensure the model is reliable and applicable, steps such as data preprocessing, appropriate feature selection, and parameter optimization were carried out meticulously. Thus, the raw information in the sample dataset was processed and transformed into meaningful outputs that security analysts can utilize in their evaluations, enabling event-based predictions to be made. An examination of the findings obtained from the artificial neural network models shows that the algorithm is a usable and effective method for the relevant classification problem when considering its accuracy level and processing times. To evaluate the performance of the developed ANN models, the system was executed, and a confusion matrix along with the performance metrics derived from it was calculated based on the obtained outputs. The results of these evaluations are presented in tabular form.

Dimensionality Reduction	Cross-Validation	Number Variables	of Accuracy (%)	Standard Deviation (%)
No	No	13	93.61	0.15
No	Yes	7	95.23	0.29
Yes	No	4	93.38	0.35
Yes	Yes	3	93.57	0.27

ÖZET

Çok modlu duygu analizi; metin, ses ve görüntü gibi farklı veri türlerinin birlikte değerlendirilmesiyle duyguların daha kapsamlı ve gerçekçi bir şekilde incelenmesini sağlayan bir yaklaşımdır. Metin verilerinde dilbilgisi yapısı ve kelime seçimi; ses verilerinde tonlama, vurgu ve ses perdesi; görsel verilerde yüz ifadeleri ve mimikler duygu durumunu anlamada önemli ipuçları sunmaktadır. Bu yöntem günümüzde sosyal medya analizinden sağlık, hukuk, eğitim ve pazarlama gibi birçok alanda yaygın olarak kullanılmaktadır. Bu çalışmada metin ve ses verileri birlikte ele alınarak çok modlu bir duygu analizi modeli geliştirilmiştir. Ses verilerinden Mel-Frequency Cepstral Coefficients (MFCC) ve mel-spektrogram tabanlı özellik çıkarımı yapılmış ve bu temsiller Convolutional Neural Network (CNN) tabanlı modeller aracılığıyla işlenmiştir. Metin verilerindeki anlamsal ve zamansal ilişkiler ise Long Short-Term Memory (LSTM) tabanlı model ile temsil edilmiştir. Erken füzyon yaklaşımı benimsenerek her iki moddan elde edilen temsil vektörleri sınıflandırma aşamasında birleştirilmiş ve bu doğrultuda çok modlu bir mimari oluşturulmuştur. Çalışmada MELD veri seti kullanılmış olup tek modlu (yalnızca metin veya yalnızca ses) yapılar ile çok modlu yapı karşılaştırılmıştır. Elde edilen sonuçlar, metin ve ses verilerinin ayrı ayrı işlendiği durumlara kıyasla çok modlu yapının daha dengeli bir performans ortaya koyabildiğini göstermektedir. Bununla birlikte, RoBERTa–BiLSTM tabanlı metin modeli ile MFCC+CNN2D ses modelinin erken füzyonla birleştirilmesinin, hem üç duygu sınıfında (pozitif, negatif, nötr) hem de yedi sınıflı duygu (öfke, tiksinti, korku, neşe, nötr, üzüntü, şaşkınlık) analizinde performansa olumlu yönde katkı sunduğu gözlemlenmiştir. Bu bulgular, erken füzyonlu çok modlu yaklaşımların duygu sınıflandırma çalışmalarında tek modlu yöntemlere göre daha bütüncül ve etkili bir değerlendirme imkanı sunduğunu ortaya koymaktadır.

Anahtar Kelimeler: Çok Modlu Duygu Analizi, Erken Füzyon, Doğal Dil İşleme (NLP), MFCC, CNN, LSTM

MULTIMODAL EMOTION ANALYSIS BASED ON EARLY FUSION USING DEEP LEARNING METHODS

ABSTRACT

Multimodal emotion analysis is an approach that enables a more comprehensive and realistic examination of emotions by jointly evaluating different types of data, such as text, audio, and visual inputs. In text data, grammar structure and word choice; in audio data, intonation, stress, and pitch; and in visual data, facial expressions and gestures provide important clues for understanding emotional states. This method is widely used today in many fields, from social media analysis to healthcare, law, education, and marketing. In this study, a multimodal emotion analysis model was developed by considering text and audio data together. Features were extracted from audio data based on Mel-Frequency Cepstral Coefficients (MFCC) and mel-spectrograms, and these representations were processed using Convolutional Neural Network (CNN)-based models. Semantic and temporal relationships in text data were represented using a Long Short-Term Memory (LSTM)-based model. An early fusion approach was adopted, combining the representation vectors obtained from both modalities during the classification stage, thereby creating a multimodal architecture. The MELD dataset was used in the study, and single-modal (text-only or audio-only) structures were compared with the multimodal structure. The results obtained show that the multimodal structure can deliver a more balanced performance compared to cases where text and audio data are processed separately. In addition, combining the RoBERTa–BiLSTM-based text model with the MFCC+CNN2D audio model through early fusion was observed to contribute positively to performance in both three emotion classes (positive, negative, neutral) and seven-class emotion (anger, disgust, fear, joy, neutral, sadness, surprise) analysis. These findings reveal that early fusion multimodal approaches offer a more comprehensive and effective evaluation opportunity in emotion classification studies compared to single-modal methods.

ABSTRACT

Understanding the emergence and stability of cooperation in asymmetric social interactions remains a central challenge in evolutionary game theory. In this study, we develop a two-population asymmetric dyadic game model incorporating heterogeneity in behavioral traits, including risk aversion and gambling tendencies, alongside an asymmetric payoff-sharing mechanism. Using both analytical derivations and Monte Carlo based spatial simulations, we investigate how localized interactions drive the evolution of strategies across different initial spatial configurations. In particular, we explore three distinct setups random, box, and circular clusters to examine how strategy update dynamics unfold under identical Fermi update rules. We further analyze how variations in neighborhood size and the use of different network topologies influence the spread and stabilization of strategies. Our results demonstrate that the spatial organization of initial strategies profoundly affects the formation and persistence of cooperative clusters, defective regions, and asymmetric strategy pairings. Clustered configurations promote more robust cooperation, whereas random arrangements are more susceptible to stochastic extinction. Moreover, increasing node degree or adopting alternative network structures, such as small-world or scale-free topologies, modifies local interactions and can enhance the resilience of cooperation. These findings highlight the intricate interplay between behavioral heterogeneity, structural asymmetry, spatial context, and network topology, providing insights into the promotion of cooperation in socio-economic systems characterized by diversity and inequality.

ABSTRACT

Artificial intelligence (AI) and Big Data are playing an increasingly important role in optimizing agricultural sustainability by addressing challenges related to productivity, natural resource management, and adaptation to climate change. Thanks to advanced algorithms, AI enables the analysis of massive volumes of data from sensors, satellites, and weather stations. These analyses promote precision agriculture, where decisions are based on accurate forecasts, thereby reducing the waste of inputs (water, fertilizers, pesticides) and optimizing yields. In terms of resource management, Big Data allows for real-time monitoring of soil and crop conditions, promoting efficient irrigation and targeted fertilization. This approach contributes to the preservation of ecosystems while enhancing the resilience of farms to climate-related risks. For example, AI can predict periods of drought or the emergence of diseases, enabling farmers to anticipate necessary interventions. However, several challenges hinder the adoption of these technologies. On the technical front, data interoperability remains a major obstacle, as platforms and tools need to be compatible with one another. Economically, the implementation costs of AI and Big Data technologies can be prohibitive for many farmers. Socially, their acceptance depends on the training and awareness of farmers. Finally, the environmental impact of digital infrastructure (servers, energy consumption) must be taken into account to avoid an environmental paradox. Thus, to fully leverage AI and Big Data in sustainable agriculture, an integrated approach is necessary, combining technological innovation, economic accessibility, and awareness-raising among sector stakeholders.

ABSTRACT

With the growing global concern over energy sustainability, microbial fuel cells (MFCs) have gained attention as a promising green technology for generating bioelectricity from biodegradable waste using bacteria. MFCs offer a powerful two-in-one solution, bioelectricity production and environmental bioremediation, making them a promising path toward a more sustainable future. The aim of this study is to use MFC to search for bioelectricity-producing bacteria from municipal wastewater to evaluate the isolate's potential in organic waste bioremediation. A duel-chambered MFC was constructed using an anode, a cathode, and Proton exchange membrane to detect the presence of exoelectrogenic bacteria. Initial detection of exoelectrogenic activity was monitored through voltage and current output measured by using a multimeter. Anode biofilm bacteria were selectively cultured on MnO_2-supplemented minimal media for 16 to 24 hours in anaerobic condition to distinguish exoelectrogens based on their ability to solubilize MnO_2 and milk-white colony formation. A second MFC was set up with the isolated strain to evaluate its electricity-generating capability. Biochemical tests and 16S rRNA sequencing were performed for identification. Furthermore, the isolate's potential in organic waste bioremediation was evaluated. The initial MFC system inoculated with mixed biofilm bacteria from municipal wastewater generated 0.22 V and 0.14 mA. After 16–24 hours, MnO_2-supplemented minimal media developed milk-white colonies, indicating exoelectrogenic bacteria solubilize MnO_2, using it as a terminal electron acceptor. Uninoculated areas remained black due to unutilized MnO_2. The second MFC, inoculated with isolated strains, showed improved outputs of 0.544 V and 0.18 mA. Biochemical tests and 16S rRNA sequencing identified *Staphylococcus capitis*. Enzymatic assays confirmed the isolate's ability to degrade protein, cellulose and lipid in organic waste. Our isolated bacteria have the capability to degrade organic waste and produce electricity as byproduct.

ÖZET

Büyükşehirlerde ve yüksek nüfus yoğunluğuna sahip kentlerde toplu taşımaya olan talebin her geçen gün artması, etkin, sürdürülebilir ve kullanıcı odaklı toplu taşıma sistemlerinin planlanması ve uygulanmasının zorunlu hale gelmesine neden olmaktadır. Özellikle yoğun nüfuslu kentlerde yaşanan trafik sıkışıklıkları, lastik tekerlekli toplu taşıma araçlarının seyahat sürelerini uzatmakta, seyahat konforunu düşürmekte ve bu sistemlerin kullanıcılar tarafından tercih edilme olasılığını azaltmaktadır. Bu bağlamda, yüksek kapasiteye sahip, daha hızlı ve daha az trafik etkisine maruz kalan metro sistemleri, kent içi ulaşımın temel bileşenleri olarak öne çıkmaktadır. Metro sistemleri, yoğun yolcu hareketlerini güvenli ve verimli bir şekilde yönetebilme potansiyeline sahip olup, kentlerin ulaşım altyapısında önemli bir rol oynamaktadır. Metro istasyonları, yoğun yolcu hareketinin yaşandığı ve karmaşık sirkülasyonların meydana geldiği alanlardır. Bu nedenle, kullanıcıların güvenli, konforlu ve hızlı bir şekilde hareket edebilmelerini sağlayacak şekilde tasarlanmaları büyük önem taşımaktadır. Özellikle yeraltında inşa edilen metro istasyonlarında, giriş-çıkış noktalarının sınırlı olması nedeniyle, olası bir acil durumda tahliye süreci zorlaşmaktadır. Bu tür durumlarda, yolcuların en kısa sürede ve düzenli bir şekilde tahliye edilmesi hem can güvenliği hem de sistem güvenilirliği açısından kritik bir öneme sahiptir. Bu nedenle, metro istasyonları projelendirilirken acil durum senaryolarının dikkate alınması büyük önem arz etmektedir. Bu çalışmada, bir metro istasyonunda yaşanan yolcu hareketleri, yaya simülasyonu yazılımı kullanılarak üç boyutlu ortamda detaylı bir şekilde modellenmiş ve yangın tahliye senaryoları simüle edilmiştir. Simülasyonlar sonucunda, tahliye süreleri, gecikme yaşanan noktalar ve darboğaz bölgeleri analiz edilmiştir. Elde edilen veriler, hizmet düzeyi kriterleri ve uluslararası tasarım standartlarıyla ilişkilendirilerek, istasyonun mevcut performansı değerlendirilmiştir. Tespit edilen sorunlar için mimari tasarım değişikliğine gidilerek çözüm önerileri geliştirilmiş ve yaya simülasyonu teknolojisi aracılığıyla tasarım önerilerinin etkisi ölçülmüştür. Böylece, metro istasyonu tasarımlarının iyileştirilmesi sürecinde yaya simülasyonunun sağladığı avantajlar ortaya konulmuştur.

Anahtar Kelimeler: Metro İstasyonu, Acil Durum Tahliyesi, Modelleme, Yaya Simülasyonu

ANALYSIS OF FIRE SAFETY IN METRO STATIONS USING PEDESTRIAN SIMULATION AND DESIGN RECOMMENDATIONS

ABSTRACT

The continuous increase in demand for public transportation in metropolitan areas and cities with high population density has made it essential to plan and implement effective, sustainable, and user-oriented public transportation systems. In particular, traffic congestion in densely populated cities extends the travel times of rubber-tired public transport vehicles, reduces travel comfort, and decreases the likelihood of these systems being preferred by users. In this context, metro systems, which have high capacity, are faster, and are less affected by road traffic, emerge as fundamental components of urban transportation. Metro systems possess the potential to manage intense passenger movements safely and efficiently, playing a significant role in the transportation infrastructure of cities. Metro stations are spaces where intense passenger movements and complex circulations occur. Therefore, it is crucial that they are designed to allow users to move safely, comfortably, and quickly. Especially in underground metro stations, the limited number of entry and exit points makes evacuation processes more challenging in case of an emergency. In such scenarios, the rapid and orderly evacuation of passengers is critical for both life safety and system reliability. For this reason, it is highly important that emergency scenarios are considered during the design phase of metro stations. In this study, passenger movements in a metro station were modeled in detail in a three-dimensional environment using pedestrian simulation software, and fire evacuation scenarios were simulated. Based on the simulation results, evacuation times, points of delay, and bottleneck areas were analyzed. The obtained data were evaluated by associating them with service level criteria and international design standards to assess the current performance of the station. For the identified problems, solution proposals were developed through architectural design changes, and the impact of these design proposals was measured using pedestrian simulation technology. Thus, the advantages provided by pedestrian simulation in the process of improving metro station designs were revealed..

SENTIMENT ANALYSIS OF PUBLIC OPINION TEXTS BASED ON LARGE LANGUAGE MODEL

Md Saiful Islam
School of cyberspace of security, Zhongyuan University of Technology, China
Email: saifulzut@hotmail.com
ORCID: 0009-0008-9819-3897

ABSTRACT

Sentiment analysis, which involves identifying and categorizing emotions in textual data, has advanced significantly with the development of large language models (LLMs). This research focuses on optimizing sentiment analysis techniques for public opinion texts using LLMs, specifically evaluating models with 7 billion parameters, such as Qwen-7B, ChatGLM2-6B, and Aquila-7B. The study assesses their performance in tasks like emotion detection, humor recognition, and metaphor identification across seven datasets, providing insights into their ability to handle various sentiment analysis tasks. To further enhance model performance, the research introduces optimization techniques, including prompt optimization to refine task understanding and fine-tuning using methods like LoRA and P-Tuning to improve sentiment analysis accuracy. The innovative aspects of this research are the evaluation of smaller-scale LLMs for sentiment analysis, alongside the exploration of prompt-based optimization and efficient fine-tuning methods. By enhancing these models, the research contributes to more effective sentiment analysis in public opinion mining, which has significant implications for businesses, governments, and society. The ultimate goal is to establish a robust sentiment analysis framework for LLMs, leading to a comprehensive academic paper and potentially a patent submission.

Keywords: Sentiment Analysis, Large Language Models (LLMs), Public Opinion Mining.

ABSTRACT

In today's digital era, vast amounts of video data are generated across platforms like YouTube, Instagram, and educational portals. Manually analyzing this content is slow, inefficient, and unstructured compared to text. To address this, the Video Analyzer project proposes an AI-driven framework that automatically understands, summarizes, and interprets videos in real time. The system combines Computer Vision (CV), Automatic Speech Recognition (ASR), and Natural Language Processing (NLP) to analyze visual, audio, and contextual information. Using deep learning models such as CNNs, RNNs, and Transformers, it can detect objects, recognize activities, convert speech to text, and produce high-level semantic summaries—moving from basic detection to comprehensive video understanding. Designed for real-time analytics, the solution supports applications in surveillance, healthcare, education, sports, and assistive technologies. It requires high-performance CPUs/GPUs along with frameworks like TensorFlow, PyTorch, OpenCV, and Hugging Face models. Ultimately, the Video Analyzer makes video content more accessible, automated, and insightful, bridging the gap between raw video data and actionable knowledge. performs sentiment analysis and generates a concise summary of the content. The Video Analyzer reduces manual effort, improves accuracy, and provides a comprehensive understanding of video material through an interactive and user-friendly interface. This system is useful for creators, researchers, and users who need quick and reliable video insights.

ABSTRACT

The increasing dependence on maritime and coastal resources for fisheries, aquaculture, agricultural logistics, and environmental monitoring has intensified the need for compact and efficient radar technologies capable of supporting modern agricultural and biosystems engineering applications. This study presents a novel S-band (2–4 GHz) rectangular microstrip antenna designed to enhance the performance of maritime radar systems used in coastal crop transport management, fishery surveillance, maritime safety, and remote environmental monitoring. The antenna integrates a serrated and perforated ground plane structure to overcome the traditional bandwidth–size limitations of microstrip designs. Implemented on a cost-effective FR4 substrate (ε_r = 4.3, h = 1.3 mm, tanδ = 0.025), the antenna maintains a compact physical size of 0.31λ × 0.31λ × 0.01λ and employs a 50-Ω inset feed for stable excitation. Simulations conducted using CST Microwave Studio Suite (2024) demonstrate excellent performance, achieving an S_{11} of –60.78 dB, a bandwidth of 1.605 GHz (2.054–3.659

GHz), 83.77% radiation efficiency, 1.76 dBi gain, and 2.53 dBi directivity. Experimental validation using CNC3-3018Pro fabrication and a LiteVNA™-64 measurement system produced closely aligned results, with a measured S_{11} of –59.60 dB at 2.28 GHz and a bandwidth of 1.505 GHz. Minor discrepancies are attributed to fabrication tolerances. The high bandwidth and efficiency of the proposed antenna make it suitable for agricultural radar applications including vessel-based crop transport monitoring, environmental sensing, livestock tracking near coastal areas, and integration into autonomous biosystems platforms. Future work will focus on improved gain enhancement, hybrid substrate optimization, and multi-band operation for expanded agricultural and environmental monitoring capabilities.

ABSTRACT

Bug Whisperer is an intelligent learning companion designed to bridge coding errors and emotional responses. The system continuously monitors a programmer's workflow, capturing errors from executed code alongside real-time emotional signals gathered through webcam analysis and keystroke dynamics. Each error event is stored with its corresponding affective state to compute a personalized frustration score. Over time, Bug Whisperer generates a visual "frustration map" that highlights which error types trigger the most stress. This map not only reveals emotional bottlenecks but also drives targeted recommendations of learning resources, helping developers strengthen weak concepts. By integrating error tracking, affective computing, and adaptive feedback, Bug Whisperer personalizes programming education, turning frustration into actionable guidance and enhancing both skill development and learner resilience.

Keywords: Facial Emotion Recognition, Keystroke Dynamics, Frustration Score, Affective Computing, Error Monitoring, Personalized Learning, Heatmap Visualization, Cognitive Load, Human-Computer Interaction, Real-Time Analysis, Emotional Feedback, Programming Education, Behavior Tracking, Adaptive Learning, Machine Learning Model, User Experience Enhancement, Stress Detection, Educational Technology.

COMPOSITION AND EMERGING APPLICATIONS OF *ZINGIBER OFFICINALE* ESSENTIAL OIL

Dr. Muhammad Imran
Associate Professor, Department of Food Science, Faculty of Life Sciences, Government College University, Faisalabad, Pakistan
Email: imran@gcuf.edu.pk

ABSTRACT

Zingiber officinale (ginger) essential oil is of growing scientific and industrial interest due to its rich phytochemical composition and notable biological activities. This abstract highlights key constituents—including zingiberene, β-bisabolene, and zingiberol—and their roles in antimicrobial, antioxidant, and anti-inflammatory functions. Advances in extraction techniques, such as optimized steam distillation and green extraction methods, have improved oil yield and bioefficacy. Recent studies support the oil's potential in reducing oxidative stress, inhibiting pathogenic microbes, and contributing to natural preservative and pharmaceutical applications. As demand for plant-derived bioactives increases, understanding compositional variability linked to cultivar type, geographic origin, and post-harvest handling is essential. Future opportunities include standardization, sustainability-focused production, and further translational research to expand the therapeutic and commercial use of ginger essential oil.

ABSTRACT

Protein denaturation was identifiend as a key factor of the development of inflammation, and inhibiting this factor is a primordial mechanim for the intiinflammatory substances. In this context, the present study aims to evaluate the anti inflammatory activity of *Olea europaea* L. leaves extract *in vitro* by assessing its ability to inhibit protein denaturation. The *in vitro* assay was performed by testing the *Olea europaea* L extract against denaturation of Bovine Serum Albumin (BSA) and egg albumin flakes (ovalbumin). The extract was prepared using hydromethanolic (85%) extraction and tested at increasing concentrations ranging from 100 to 800 µg/mL. The diclofenac sodium a synthetic non-steroidal anti-inflammatory drug was assayed in similar experimental conditions as a positive control. The findings demonstrated that *Olea europaea* L. leaves extract exhibited particularly high efficacy at 800 µg/mL, reaching an inhibition percentage of 81.59% by BSA test and 75.18% by ovalbumin test which suggests a strong protective activity against thermal protein denaturation. Conversely, diclofenac sodium exhibited an percentage inhibition of 67. 36% at 800 µg/mL. These findings suggest that the anti-denaturation effect of olive leaves extract is comparable to, and in some cases more potent than, that of diclofenac sodium. This results suggests that *Olea europaea* L leaves extract possesses a significant anti-inflammatory properties, which may be attributed to its rich phenolic composition such as oleuropein and it can be used as a promising natural alternative to anti-inflammatory synthetic drugs.

Keywords: antiinflamatory activity, *in vitro*, *Olea europaea* L., hydro-methanolic extract.

GHMYB44 ORCHESTRATES A MULTI-TIERED CASCADE TO REGULATE SECONDARY CELL WALL BIOSYNTHESIS IN COTTON FIBERS

ABSTRACT

Secondary cell wall (SCW) formation is essential for generating the mechanical strength and structural integrity of specialized plant cells. Cotton fibers provide an excellent single-cell model for dissecting the regulatory mechanisms underlying massive cellulose deposition. However, how upstream transcription factors coordinate the sequential activation of SCW biosynthetic genes remains incompletely understood. In this study, we identify GhMYB44, an R2R3-MYB transcription factor, as a central regulator orchestrating a multi-tiered transcriptional cascade controlling SCW biosynthesis in cotton fibers. Functional analyses demonstrate that GhMYB44 acts as a positive regulator of SCW formation and directly activates the NAC-domain transcription factor GhFSN43, a key determinant of cellulose synthesis. GhFSN43 subsequently induces major cellulose synthase genes, establishing a complete regulatory module from an upstream MYB to

downstream structural genes. We further uncover two critical protein–protein interaction nodes that amplify transcriptional output within this pathway. GhMYB44 forms a complex with the HD-ZIP III protein GhREV5, enhancing the initial transcriptional activation of GhFSN43. At the downstream level, GhFSN43 cooperates with GhFSN1 to strengthen activation of cellulose biosynthetic genes. These synergistic interactions ensure robust and efficient SCW deposition during fiber development. Together, our findings reveal a multi-layered regulatory network in which transcriptional control is reinforced through hierarchical TF–TF interactions. This work provides new mechanistic insight into SCW biosynthesis and identifies promising molecular targets for improving cotton fiber quality and performance.

ABSTRACT

This study investigated the use of duckweed as a sustainable and cost-effective alternative feed for *Clarias gariepinus* in an aquaponic system. The primary objective was to assess the growth performance and economic viability of incorporating duckweed into the fish diet. A Completely Randomized Design (CRD) was employed with five dietary treatments (DT) where duckweed replaced commercial feed at 0% (DT I, control), 25% (DT II), 50% (DT III), 75% (DT IV), and 100% (DT V). One hundred fingerlings were distributed into five tanks (20 fish per tank) and fed twice daily at 5% body weight for four weeks. Growth parameters, feed utilization, and economic indices were monitored. Results indicated that the 50% duckweed inclusion level (DT III) yielded the best growth performance, with a significantly higher ($P<0.05$) mean final weight (75.97 g), specific growth rate (3.43%/day), and the best feed conversion ratio (1.28). Diets with higher duckweed inclusion (DT IV and DT V) resulted in significantly poorer growth and feed efficiency. Proximate composition of the fish flesh showed that higher duckweed inclusion increased crude protein content. Economically, despite a higher feed cost, DT III generated the highest gross revenue (₦3,038.67), net profit (₦2,968.16), and cost-benefit ratio (43.11), demonstrating superior profitability. The study concludes that duckweed can effectively replace up to 50% of commercial feed in the diet of *Clarias gariepinus* without compromising growth, while significantly enhancing economic returns. It is recommended that farmers adopt this moderate inclusion level to reduce production costs and improve the sustainability and profitability of *Clarias*-duckweed aquaponics systems.

Keywords: Aquaponics, *Clarias gariepinus*, Duckweed, growth assessment, Economic indices, Sustainable Aquaculture.

BACTERIOLOGICAL ASSESSMENT OF MOUSSA STREAM IN BIDA, NIGER STATE, NIGERIA

ABSTRACT

The study assessed the bacteriological quality of Moussa Stream in Bida, Niger State, Nigeria, Water samples were collected from three different locations and cultured on Nutrient Agar (NA), MacConkey Agar (MCA), and Salmonella–Shigella Agar (SSA). Serial dilution and pour-plate techniques were used to determine microbial load, while bacterial identification was carried out using colony morphology, Gram staining, and relevant biochemical tests. Results showed that microbial loads varied across sampling points, with downstream samples exhibiting the highest counts. Microbial loads on NA ranged from 2.4×10^5 to 4.6×10^5 CFU/mL, while MCA recorded 6.8×10^3 to 1.9×10^4 CFU/mL, and SSA ranged from 1.2×10^3 to 3.9×10^3 CFU/mL. A total of 24 bacterial isolates were identified, with *E. coli*, *Salmonella* sp., and *Staphylococcus* sp. each accounting for 16.67% of the isolates. *Streptococcus* sp., *Pseudomonas* sp., and *Klebsiella* sp. each constituted 12.5%, while *Shigella* sp. and *Bacillus* sp. represented 8.33% and 4.16%, respectively. Most isolates grew on Nutrient Agar, while selective media (MCA and SSA) confirmed the dominance of Gram-negative enteric bacteria. The presence of faecal indicators and pathogenic organisms suggests potential public health risks associated with the use of the stream for domestic, recreational, or agricultural purposes. Continuous monitoring and the implementation of appropriate water management strategies are recommended to safeguard community health.

NONLINEAR RANDOMISED COMPLETE BLOCK DESIGN AND ANALYSIS OF SAPONINS EFFECT ON CRUDE OIL SPILL REMEDIATION.

ABSTRACT

In this study, an intrinsically nonlinear randomized complete block design (INRCBD) model with fixed and random block effects where the mean part of the INRCBD model follows a three-parameter Weibull growth function are formulated. The parameters of the formulated models are estimated using the estimated generalized least square (EGLS) approach where the variance components for random block and error terms are estimated via maximum likelihood estimator (MLE) and restricted maximum likelihood estimation (REML). The fitted models adequacy and goodness of fit are assessed using the median adequacy measures (MAM). The formulated models were applied to a $7^1 \times 6^1$ treatment combination data with 3 blocks for determining the effects of Saponins on oil spillage remediation. The results from MAM and IC revealed that the Weibull RCBD model with random block effect with parameters estimated using the EGLS-MLE is most adequate and provided the best fit compared to the other models. Also, the results further revealed that the EGLS-MLE estimator consistently outperformed EGLS-REML based on its parameter estimates lower standard errors. Hence, the estimates of the INRCBD model with random block effect from EGLS-MLE is more adequate, stable, and reliable.

BRIDGING QA GAPS WITH AI: A STUDY OF PREDICTIVE ACCURACY AND TEST AUTOMATION EFFICIENCY

Irfanul Haque
Software Quality Assurance Engineer, BRAC IT
Email: i.haquenabil@gmail.com

ABSTRACT

Modern software projects face immense pressure as release cycles shorten, and system complexity grows. Many studies show that more than 50% of defects are still detected after deployment, highlighting the limitations of traditional Quality Assurance (QA) methods. This paper presents a practical evaluation of how Artificial Intelligence can improve Software Quality Assurance by reducing manual effort and enabling earlier defect detection. Using data from two internal projects - containing an average of 420 historical defects, 1200 test cases and several weeks of system logs - the study assesses the impact of machine learning, natural language processing and anomaly-detection models. Results show that ML-based defect prediction achieved 72–84% accuracy, while NLP-driven test generation cut manual test design time by nearly 30%. AI-supported test maintenance further reduced script-update efforts by 35%, particularly during frequent UI changes. Real-time monitoring models were also able to detect unusual system behavior minutes before user-visible slowdowns. Although challenges remain, especially regarding data quality and model interpretability, the findings indicate that combining human expertise with targeted AI tools can significantly enhance QA efficiency and software reliability.

ABSTRACT
In this study, activated carbon was synthesized from two-phase olive mill waste through a two-step process: hydrothermal carbonization, followed by chemical activation. The resulting AC showed a significant increase in carbon content from 44.43% to 89.64%, and a high specific surface area. The activated carbon was evaluated for the adsorption of Methylene Blue and Amitriptyline, demonstrating that the adsorption kinetics followed a Pseudo-Second-Order (PSO) model, while equilibrium data fit well with the Langmuir isotherm. The activated carbon exhibited impressive monolayer adsorption capacities mainly due to its large surface area. These results highlight the potential of valorizing olive mill waste for environmental applications. The study also underscores the effectiveness of HTC combined with activation in producing efficient biosorbents for persistent organic pollutants.

ABSTRACT

The timely identification of infectious disease epidemics is necessary to prevent large scale outbreaks and minimize public health threats. In older surveillance it relies on clinical report and laboratory confirmation, thus may be delayed. The advances in AI and ML have the potential use as an early outbreak detection tool to analyze huge amount of data streams continuously. This mini review synthesizes prominent AI based strategies, particularly ML models, deep learning methods and NLP techniques. Machine learning approaches, including random forests, support vector machines and gradient boosting, use past case monitoring data as well as climate factors and population mobility to forecast the path of outbreaks. Deep learning approaches such as LSTM and Transformer based models are capable of capturing complex temporal patterns for the purpose of disease forecasting. NLP tools used for analyzing news reports, social media posts and official reports in order to identify early indicators of outbreaks, using LLMs to automatically triage and summarize. Existing platforms, like BlueDot, HealthMap, and GPHIN demonstrate the real-world use and promise of AI enabled surveillance. But there are obstacles, such as lack of data in resource poor countries and misinformation from online sources, privacy issues and the necessary provision for surveillance to be worked into public health systems. Future work focuses on multi source fusion, explainable AI and cost-effective solutions for global use. Early warning systems for infectious diseases, powered by artificial intelligence [AI], are paradigmatically transformative in that they enable faster and more accurate detection on a global scale, with unprecedented implications for epidemic preparedness and response.

ABSTRACT

Myrtus communis L. (M. communis), commonly known as myrtle, is an aromatic shrub belonging to the Myrtaceae family, widespread throughout the Mediterranean basin. M. communis is a plant that has attracted considerable interest among scientists. It is recognized for its digestive, antiseptic, antimicrobial, astringent, and toning properties. Its bioactive compounds, including terpenes, phenolic acids, flavonoids, and anthocyanidins in various plant organs, contribute to its multiple pharmacological effects. The objective of this study is to determine the secondary metabolites of the hydroethanolic extract (MC-HEE) of M. communis, as well as to evaluate its antioxidant activity. M. communis leaves were used for the various tests. The antiradical activity of (MC-HEE) was evaluated using the ABTS (2,2'-azino-bis-(3-ethylbenzothiazoline-6-sulfonic acid)) reduction test. The results revealed the presence of flavonoids, phenols, tannins, coumarins, and saponins, with no flavone glycosides. Quantitative analysis showed a predominance of total polyphenols (4.061 ± 0.134 mg EAG/g extract) and flavonoids (3.918 ± 0.331 mg EQ/g extract). The extract showed significant antioxidant activity in trapping the ABTS free radical (PI = 70%). These results suggest that the hydroethanolic extract of myrtle has powerful antioxidant activity, which is mainly due to its phytochemical composition rich in secondary metabolites: polyphenols, flavonoids, tannins, and others.

Keywords: *Myrtus communis L.*, hydroethanolic extract and antioxidant activity.

A STUDY ON BACKGROUND NOISE REMOVAL USING DEEP LEARNING ALGORITHMS

S. Lakshmi
SRM Institute of Science and Technology, Kattankulathur
Email: lakshmi1503@gmail.com

ABSTRACT

One of the vital research topic is noise removal in signal processing especially in the applications such as telecommunication,multimedia,speech recognition,restoration of music and speech enhancement.It degrades the quality of the audio significantly and the conventional approaches have its own limitations in handling complex and dynamic noisy environment.This paper explores the deep learning techniques for effective noise reduction in audio files and outline the methodology from data acquisition to evaluation of deep learning algorithms quantitative as well as qualitative methods.A custom dataset combines clean speech samples with various synthetic noisy data such as traffic, crowd chatter and machinery. This paper implements various deep learning algorithms for enhancing the speech and reducing the noise and produce the foundation for real time speech enhancement technologies.

STUDY OF THE PHYSICO-CHEMICAL AND BACTERIOLOGICAL QUALITY OF GROUNDWATER: CASE OF THE GHAZAOUET REGION (TLEMCEN PROVINCE)

ABSTRACT
Water is a precious natural resource essential for multiple uses. When intended for food-related or hygiene purposes, it must meet high physico-chemical and microbiological quality standards. To assess the quality of water sources intended for human consumption in the Ghazaouet region, located in the far northwest of the Tlemcen Province, a physico-chemical and bacteriological analysis was carried out on several water samples collected from five water sources in the area (Ben Taghla, Ben Tawes, Ain El Mizab, Sidna Youchaa, and Ain Elkanout). Analyses were performed on these samples by measuring physico-chemical and bacteriological parameters such as temperature, pH, electrical conductivity (EC), turbidity, color, total hardness, suspended solids (SS), dry residue, carbonates (TA) and bicarbonates (TAC), nitrites (NO_2^-), orthophosphate, total coliforms, and fecal streptococci. According to our results, the physico-chemical analysis showed that the studied water sources comply with acceptable standards (Algerian standards and WHO guidelines). From a bacteriological point of view, two of the water sources were found to comply with the standards, while the remaining three exceeded the permitted limits. The high presence of microbial contaminants in the water may pose a significant health risk to residents who rely on these sources to meet their daily water needs.

ABSTRACT

This study investigated the production and quality evaluation of peanut products formulated from composite flour consisting of wheat flour, groundnut, and egg. Three composite formulations were developed and assessed through proximate analysis and sensory evaluation using a 9-point hedonic scale. Proximate results showed that increasing the proportions of groundnut and egg enhanced the nutritional quality of the products, particularly in protein, fat, fibre, and ash content, while reducing carbohydrate levels. Sensory evaluation revealed no significant differences ($p > 0.05$) among samples for taste, aroma, colour, texture, flavour, and overall acceptability, although Sample A showed the highest overall preference. These findings demonstrated that composite flour technology can yield nutritionally enriched and consumer-acceptable peanut products. It is concluded that composite peanut formulations are feasible and nutritionally beneficial, and it is recommended that food producers adopt optimised composite blends for large-scale production and further product improvement.

Keywords: Composite formulation; Peanut product; Nutrient enrichment; Proximate analysis; Consumer acceptability

ABSTRACT

Introduction: Plant growth-promoting endophytic bacteria (PGPEB) isolated from root nodules of forest trees in tropical and subtropical regions, enhance plant defense mechanisms against salinity stress. These endophytes hold great potential for improving cultivation practices in the saline-affected coastal farmlands of Bangladesh. Methods: Endophytic bacteria were isolated from the root nodules of one-year-old seedlings of *Samanea saman* and *Acacia auriculiformis*, and evaluated for their effects on tomato seedlings under 150 mM salt stress. Five bacterial isolates, identified as *Bacillus* spp. closely related to *B. pumilus, B. altitudinis, B. safensis,* and *B. xiamenensis* were characterized and confirmed by 16S rRNA. Results: These endophytes

exhibited diverse plant growth-promoting (PGP) traits in vitro, including biofilm formation, exopolysaccharide production, ammonia, HCN, IAA, GA, zinc solubilization, and nitrogen fixation. Among them, AARN-1 (*Bacillus altitudinis*) showed strong tolerance at 900 mM salinity. In soil and hydroponic trials, inoculation with these endophytes significantly enhanced tomato (*Solanum lycopersicum*) seedling growth under 150 mM salt stress, with AARN-1 demonstrating the greatest effect. AARNN-1 inoculated plants exhibited lower malondialdehyde and H_2O_2 levels, along with higher chlorophyll, proline, carotenoid, and stress-related enzyme production compared to uninoculated control. Conclusion: This study highlights *Bacillus* sp. as a promising candidate for eco-friendly biofertilizer development to improve crop cultivation in saline-prone regions of Bangladesh.

ABSTRACT

The ecosystem of the Mount Chenoua forest plays an important role in the Tipaza region of algeria, however it is threatened by agricultural activities. The impact of pesticides is a major concern due to their wide distribution and their harmful effects on biodiversity. The objective of this work is to carry out an assessment of the impact of agricultural practices in the study area. First by collecting data on agricultural practices through field surveys, in order to know the list of pesticides used, then by carrying out a bibliographic investigation on the impact on biodiversity (targeting and bioaccumulation, lifespan as well as the legal status of these pesticides). This study consisted of identifying and evaluating the effects of agriculture on the physical and biological environment of the ecosystem of this forest. Among the 10 farmers surveyed, 52 pesticides are used on 140 hectares. The production system is dominated by arboriculture. Agricultural practices destroy the different layers of the forest and negatively impact the flora and fauna of this ecosystem. The impact of agricultural activities on the forest ecosystem was assessed using a grid that balanced the sources of impact and the biophysical elements of the environment, ranging from moderate to major. To mitigate the negative impacts of agricultural activities on the forest ecosystem, the following practices should be encouraged, such as agroforestry, organic farming, agroecological farming, and conservation agriculture.

Keywords: Mount Chenoua, Biodiversity, Pesticides, Impact, Agriculture, Forest.

ABSTRACT

The purpose of this study was to determine the effectiveness of a green and ecological formulation derived from cannabis seeds vegetable oil (*cannabis sativa L*) marked as CSO, obtained through hot pressing, as a corrosion inhibitor for protecting carbon steel (C38) from significant corrosion, notably in acidic environments such as HCl (1M). Experiments were carried out using the gravimetric weight loss (WL) of CSO was examined, and electrochemical methods at different concentrations: potentiodynamic polarization (PDP) and electrochemical impedance spectroscopy (EIS). The results from potentiodynamic polarization curves confirmed that CSO functions as an effective mixed corrosion inhibitor with predominant anodic activity. The inhibition efficiency of CSO increases with increasing concentration, reaching values of up to 91% at a concentration of 0.6 g/l. CSO forms a protective barrier layer on the surface of carbon steel, thereby reducing the contact area between the metal and the corrosive solution. The adsorption of CSO on the carbon steel followed Langmuir isotherm, the standard free Gibbs energy value is negative, which indicates the spontaneity of adsorption of the inhibitor on the metal surface. This value equal to -20 KJ.mol-1 between -20 Kj.mol-1 and -40 kJ·mol-1 shows that the green inhibitor is adsorbed by a mixed mechanism (physics-chemisorption).

ABSTRACT

In this work, we investigate the corrosion-inhibition performance of 2-ethyl-6-nitro-2H-indazole (6NE2) on C38 steel in 1 M HCl using a combined experimental and theoretical strategy. Electrochemical measurements reveal the strong protective ability of 6NE2, with potentiodynamic polarization and EIS indicating inhibition efficiencies of 95.4% and 94.7% at 10^{-3} M. SEM imaging confirms the formation of a compact, homogeneous protective film on the steel surface in the presence of the inhibitor. Adsorption studies show that 6NE2 follows the Langmuir isotherm, and the thermodynamic parameters point to a spontaneous and stable adsorption process. Complementary DFT calculations and molecular dynamics simulations highlight favorable electronic interactions and stable adsorption configurations between 6NE2 and the steel interface. Together, these results demonstrate that 6NE2 acts through strong adsorption and efficient film formation, positioning it as a promising and environmentally benign corrosion inhibitor for steel in acidic environments.

ABSTRACT

Infertile soil results in lower quality cucumber fruits which are often rejected by consumers and thereby reducing farmers' income, making fertile soil a great requirement for profitability and yield maximization cucumber production. This study therefore analyzed the efficacy of Neem Organic Fertilizer (NOF) requirements for optimal yield and economic profitability for cucumber production. A field experiment was conducted in May 2025 at the Horticultural Technology Farm, Federal Polytechnic, Ilaro, Ogun State, (Latitude 6^0 53^1N and Longitude 2^0 58^1E). Nigeria. There were four organic rates of treatment comprising 0, 5, 10, and 15 t ha-1 of NOF brand. Treatments were arranged in a Randomized Complete Block Design (RCBD) with four replications. Fertilizers were applied at two weeks before planting. Data were collected on cucumber yield from six weeks after planting until the end of the experiment; the data collected were subjected to analysis of variance using GENSTAT discovery, and treatment means were separated using Duncan's Multiple Range Test (DMRT) at a 5% probability level**.** The economic assessment was carried out using the partial budget techniques involving the analysis of variable costs and benefits of the treatments involved in the experiment. Gross field benefit (GFB), Total cost (TC), Net benefit (NB) and Marginal rates of return (MRR) was calculated to determine the profitability. Neem Organic Fertilizer rates had a significant effect on fruit yield, cucumber plant nourished with 15t/ha application produced the highest fruit yield of 45.89t/ha but did not differed significantly from 39.66 and 37.39t/ha fruit yield produced from 5 and 10t applications. Conversely, treatments application of 5t/ha gave the highest MRR of ₦3,238 as it returned ₦2,238 at every ₦1,000 invested, while the lowest MRR was obtained from control that returned ₦1417 at every ₦1,000 invested. Economic analysis showed that 5 t/ha Neem Organic Fertilizer application is the most economical and more profitable than other rates of application and control.

ABSTRACT

Optimizing pre-treatment in reverse osmosis (RO) demineralization systems is crucial for ensuring optimum water quality and prolonging membrane life by limiting rapid fouling. In this study, the treatment of water from the Aït Massoud dam, which supplies Maroc Central's reverse osmosis (RO) demineralization plant, was optimized using a Box-Behnken design. Three factors were studied: aluminum sulfate dose (10, 40 and 70 mg/L), polyelectrolyte dose (0.1, 0.2 and 0.3 mg/L) and recirculated sludge volume (5, 50 and 95 mL), to assess their impact on turbidity and oxidizable matter (OM) removal. The factors of recirculation sludge volume and aluminum sulfate dose affected the removal of turbidity and OM to the greatest extent possible. The optimum doses found for the removal of turbidity and OM were 46 mg/L aluminum sulfate, 0.22 mg/L polyelectrolyte, and 52 mL of sludge per liter of water. With these optimum doses, model results predicted 100% removal of turbidity and 72% removal of OM. These optimum doses were subsequently applied at full scale in the Maroc Central treatment plant. The findings indicated efficiency, for turbidity removal ranged from 94.12% to 98.49% and OM removal from 69.23% to 72.73%. The results were in close agreement with the model predicted values thus providing further assurance of the viability of this model for practical purposes under real operating conditions. Besides enhancing water treatment performance, the process resulted in a 38% reduction in sludge generation, 15% reduction in coagulant application, and 11.5% reduction in energy requirements while increasing membrane cleaning

cycles by 43%. Such improvements generated annual savings of about €60,150, strengthening the case for economic and environmental sustainability. However, the findings are site-specific and require validation under varying conditions and extended operation to assess long-term performance and reliability.

Keywords: Reverse osmosis; Box-Behnken design; coagulation flocculation; Sludge; optimization.

ABSTRACT

Fertilizers are essential for increasing crop yield, maintaining soil fertility, and ensuring nutrient supply. However, excessive use can lead to environmental issues such as nutrient loss and pollution. Eco-friendly organomineral fertilizers with slow and controlled release offer a sustainable alternative, enhancing nutrient use efficiency while reducing environmental impact. This study examines the formulation effects of organomineral fertilizers and sustainable biological coating material: pectin extracted from orange peels for its gelling, thickening, and stabilizing properties, as a barrier for controlled-release fertilizers (CRFs). By valorizing agro-industrial waste through aerobic and anaerobic biotransformation, nutrient-rich materials are converted into biofertilizers and combined with phosphogypsum (PG) to produce organomineral fertilizers with slow and controlled nutrient release. FTIR, SEM, pH analysis, NPK release, germination, and fertilization tests were conducted to assess the effectiveness of coated and uncoated fertilizers compared to conventional fertilizers. The best performing mixtures demonstrated optimal nutrient release profiles: M2-coated (compost) released only 22.05 (±1.43) % of nitrogen over 28 days, M5- coated (50% compost–50% PG) displayed a

sustained phosphorus release profile with 33.17(±2.16) % over 28 days, and M5-coated exhibited a controlled potassium release, reaching just 25 (±1.45) % within 28 days, meeting CRF standards for nutrient release over time. Results highlight the potential of these CRFs to enhance nutrient release efficiency, reduce leaching, and improve soil health, supporting climate-smart agriculture. This approach aligns with Conservation Agriculture principles and contributes to Sustainable Development Goals 2, 12, and 13 by promoting sustainable agriculture and minimizing environmental impact.

ABSTRACT
This investigation focuses on the geomechanical characterization of soils at the Jorf Lasfar construction site, located near the city of El Jadida in Morocco, in an environment characterized by natural rock formation procedures. The principal focus is to characterize the nature of the soils in order to select the most suitable construction techniques for the local conditions. The results show that the high-altitude areas are dominated by calcareous clay soils, characterized by specific plastic and mechanical behavior. Intermediate areas exhibit lithological diversity, including sandy-clay, marly-calcareous, and tuffaceous-calcareous formations, while low-lying areas are mainly composed of sandy soils with distinct geomechanical properties. This variability is a key factor in defining the construction methods appropriate for each sector of the site. To support this analysis, several tests were carried out, including direct shear tests to assess mechanical strength, water retention curves to assess hydraulic properties, and laboratory and in situ tests. These tests made it possible to establish correlations between the physical properties of the soils, their structure, and their mineralogical and lithological composition. This integrated approach facilitates a better understanding of soil behavior under environmental and mechanical constraints.

ABSTRACT

Due to rising environmental concerns, sustainable consumption has become critical for individuals and businesses, with eco-conscious trends growing rapidly. Understanding consumers' attitudes toward green products and the factors affecting their purchase decisions is crucial. Personal care products are particularly meaningful in this context, as their frequent use and sensitivity to chemical content make them one of the categories that most clearly reflect consumers' environmental attitudes. This study aims to examine the factors that influence Turkish consumers' purchase intentions regarding green personal care products. In the first phase, a focus group study explored consumers' perceptions of green personal care products. Factors including environmental attitude, concern, quality, price, accessibility, and brand image were examined. Participants view "green" products positively, but ingredient concerns, high prices, limited variety, and brand distrust affect purchase intention. Despite strong environmental awareness and moral responsibility, some consumers have stated that they do not want to pay more for green products with similar performance. Economic considerations therefore play a decisive role in shaping actual purchasing behavior. Moreover, due to limited green variety, certain consumers prioritize continuity with familiar items but are willing to choose greener options—even at higher prices—when performance is equivalent. Reliable certifications build trust but participants noted that they could not fully define any brand as genuinely "green."Social media and peer recommendations influence decisions, but many consumers stated that they made their final decision based on their own research. And also product experience is highly valued, many participants prefer "refill " options for affordable trials. A quantitative study will follow the focus group to validate findings and test variable relationships. The research seeks to deepen insight into sustainable consumption and guide businesses in developing environmentally responsive strategies.

ÖZET

Günümüzde sürdürülebilir enerji üretimi, çevresel yönetim stratejileri ve döngüsel ekonomi yaklaşımları kapsamında mikroalgler, yenilenebilir biyoteknolojik kaynaklar arasında giderek daha fazla önem kazanmaktadır. Mikroalgler; yüksek fotosentetik verimleri, hızlı büyüme özellikleri ve çeşitli çevresel ortamlara uyum sağlayabilme kapasiteleri sayesinde biyoyakıt üretimi, atık su arıtımı, gıda ve besin takviyeleri gibi pek çok alanda çevre dostu çözümler sunmaktadır. Bu çalışmada, mikroalglerin yaşam döngüsünün ekolojik performansı, çok kriterli karar verme yöntemlerinden biri olan TOPSIS (Technique for Order Preference by Similarity to Ideal Solution) yöntemi kullanılarak kapsamlı bir biçimde değerlendirilmiştir. Yürütülen çalışma kapsamında, santrifüj, flokülasyon ve filtrasyon olmak üzere üç farklı hasat yöntemi; biyokütle verimliliği, enerji tüketimi, maliyet, su kullanımı ve çevresel etki kriterleri esas alınarak TOPSIS yöntemiyle karşılaştırmalı olarak değerlendirilmiştir. Yapılan hesaplamalar sonucunda flokülasyon yöntemi, genel performans açısından en uygun hasat alternatifi olarak belirlenmiştir. Çalışma kapsamında gerçekleştirilen duyarlılık analizi, kullanılan TOPSIS modelinin güvenilirliğini ve istikrarını doğrulamış, kriter ağırlıklarındaki değişimlere rağmen sonuç sıralamasında anlamlı bir farklılık gözlenmemiştir. Bu durum, modelin sağlam bir yapıya sahip olduğunu ve elde edilen bulguların literatürdeki benzer çalışmalarla yüksek düzeyde uyum gösterdiğini ortaya koymuştur. Elde edilen bulgular, mikroalglerin biyoteknolojik uygulamalarda etkin ve verimli biçimde kullanılabilmesi için doğru hasat yönteminin seçiminin büyük önem taşıdığını göstermektedir. Bu bağlamda araştırma, gelecekteki çalışmalar için hem teorik hem de uygulamalı düzeyde yol gösterici bir referans niteliği taşımaktadır.

EVALUATION OF MICROALGAE HARVESTING METHODS WITH MULTI-CRITERIA DECISION-MAKING MECHANISMS: A TOPSIS EXAMPLE

ABSTRACT

Today, within the scope of sustainable energy production, environmental management strategies, and circular economy approaches, microalgae are gaining increasing importance among renewable biotechnological resources.Microalgae provide environmentally friendly solutions in many fields such as biofuel production, wastewater treatment, food, and nutritional supplements thanks to their high photosynthetic efficiency, rapid growth characteristics, and ability to adapt to various environmental conditions. In this study, the ecological performance of the life cycle of microalgae was comprehensively evaluated using the TOPSIS (Technique for Order Preference by Similarity to Ideal Solution) method, which is one of the multi-criteria decision-making techniques. Within the scope of the conducted study, three different harvesting methods—centrifugation, flocculation, and filtration—were comparatively assessed through the TOPSIS method based on the criteria of biomass productivity, energy consumption, cost, water usage, and environmental impact. As a result of the calculations, the flocculation method was determined to be the most suitable harvesting alternative in terms of overall performance. The sensitivity analysis conducted within the scope of the study confirmed the reliability and stability of the TOPSIS model used, and no significant difference was observed in the ranking of results despite changes in the criterion weights.This situation revealed that the model has a robust structure and that the obtained findings show a high level of consistency with similar studies in the literature. The results indicate that selecting the appropriate harvesting method is of great importance for the effective and efficient utilization of microalgae in biotechnological applications. In this context, the research serves as a guiding reference at both theoretical and practical levels for future studies.

EVALUATION OF MAKSUTLU DAM LAKE (SİVAS, TÜRKİYE) WATER QUALITY IN TERMS OF ELEMENTAL LOAD

Gazel Burcu AYDIN
Trakya University, Faculty of Science, Department of Biology, 22100 Edirne, Türkiye
Hydrobiology,
Email: gburcuaydin@trakya.edu.tr

ABSTRACT

This study aims to evaluate the suitability of irrigation water and the elemental composition of Maksutlu Dam Lake, located within Sivas Province and built for irrigation purposes. Water samples were collected from three stations in the dam lake during the dry (autumn) season, and elemental analyses were performed. Regarding irrigation suitability, the results of the sodium absorption rate (SAR), magnesium ratio (MgR), and percent sodium (% Na) indices indicated that the water is suitable for irrigation; however, the Kelly index (KI) suggested it is only marginally suitable. Concerning toxic elements, the HPI index (HPI > 100) showed that all stations were polluted. According to the MI index, all stations were classified as extremely polluted at level VI (MI ≥ 6). Based on the Surface Water Quality Management Regulation of Türkiye, the water quality classes were determined as follows: Class IV for lead (Pb); Class III for aluminum (Al); Class II for chromium (Cr), iron (Fe), nickel (Ni), zinc (Zn), copper (Cu), and arsenic (As); and Class I for manganese (Mn), cobalt (Co), selenium (Se), and cadmium (Cd).

ABSTRACT

This study aims to quantitatively assess the impacts of climate change by fitting the Actuarial Climate Index (ACI) for Istanbul using daily data covering the period 1981-2025. The ACI is an index developed to measure the effects of climate change and to serve as a decision-support tool across various sectors. The basic components of the ACI used in this study include high temperature (T90), low temperature (T10), extreme precipitation, wind speed, and drought. Although sea level is also a component of the ACI, its estimation was not included in this study due to insufficient data. The data were obtained from the NASA POWER LARC database, and the drought component was calculated using the consecutive dry days method. Daily data were aggregated to a monthly scale, and standardized anomalies were calculated for each component based on the 1981-2010 reference period mean and standard deviation. The results of the analysis indicate a pronounced increasing trend in both high and low temperature components in Istanbul after 1981. Seasonal fluctuations were observed in extreme precipitation and wind speed, whereas the drought component revealed negative anomalies, indicating prolonged dry periods. These findings demonstrate that Istanbul has been increasingly affected by climate change over the past four decades, with a noticeable rise in the frequency of extreme weather events. The results also support the need to re-evaluate risk assessments in sectors such as energy, agriculture and insurance. In the next stage of the study, the ACI components will be analyzed using machine learning (ML) techniques. The modeling of the temporal development of the ACI and making future projections aim to improve the forecasting of local climate risks and contribute to sustainable adaptation policies.

ABSTRACT

The common use of fossil fuels today has led to the rapid depletion of existing reserves. These resources are also among the primary reasons for environmental issues such as air and water pollution and climate change. Therefore, hydrogen stands out as a sustainable energy carrier because it is carbon-free and produces only water as a byproduct of combustion. Its cost-effectiveness, ease of storage, and potential use as a renewable energy source have placed hydrogen energy at the center of current research. Chemical hydrogen storage and recovery processes attract attention due to the advantages they offer. Sodium borohydride ($NaBH_4$) is a prominent chemical hydrogen carrier owing to its high theoretical hydrogen storage capacity, rapid hydrogen release at low temperatures, and structural stability. For this reason, it is essential to develop high-performance catalysts that can enhance the efficiency of the $NaBH_4$ hydrolysis reaction. Metal nanoparticles used as catalysts accelerate reaction kinetics and improve hydrogen production efficiency. Transition metals like cobalt (Co) and nickel (Ni), which are more abundant and less expensive, are preferred over noble metals, which are more common and expensive. In this context, boride derivatives of transition metals positively influence catalytic activity by enabling the formation of a higher number of active sites on the metal surface. In this study, bimetallic amorphous Co–Ni–B nanoparticles were synthesized via the chemical reduction method. The synthesized Co–Ni–B nanoparticles were subjected to heat treatment at 250, 350, and 450°C for 2 hours under a nitrogen atmosphere. The hydrogen generation rate was calculated by dividing the volume of hydrogen released during the reaction by the catalyst mass and reaction time. According to the results, the hydrogen generation rate was determined as 1127 mL min^{-1} $gcat.^{-1}$ for the catalyst heat-treated at 250°C, 1625 mL min^{-1} $gcat.^{-1}$ at 350°C, and 930 mL min^{-1} $gcat.^{-1}$ at 450°C. The highest hydrogen generation rate was achieved after heat treatment at 350°C. This outcome is attributed to the fact that heat treatment at the optimum temperature promotes a more homogeneous pore size distribution, increased

specific surface area, and preservation of active surface sites. These structural features facilitate the interaction between reactants and the catalyst surface, ultimately enhancing hydrogen production performance.

ABSTRACT

Creating a straightforward and accurate analytical technique to identify 4-nitrophenol (4-NP), one of the most hazardous organic pollutants that poses a constant threat to the environment, is essential. In this study, we designed a trimetallic-supramolecular polymer (HMSMP), combining three mostly abundant transition metals Co(II), Fe(II), Ni(II) salts and terpyridine moieties [4′,4′′′′-(1,4- Phenylene) bis(2,2′:6′,2′′-terpyridine)] (polyCoFeNi), to evaluate the sensitivity and selectivity of glassy carbon electrodes (GCE) toward 4-nitrophenol. Different characterization techniques were used to investigate the morphological and elemental compositions of polyCoFeNi. With a molecular weight of 2.43×10^6 Da of the polymer, a symmetrical ligand was formed with terpyridine moieties and trimetallic interactions. The electrochemical nature of polyCoFeNi_GCE was examined using CV analysis, revealing a low detection limit of 0.102 µM across a broad linear range of 1-2000 µM. A detailed reaction mechanism was postulated based on the kinetics study. Finally, stability, interference, reproducibility and applicability tests showed excellent recovery, anti-interference activity with high stability, affirming the sensor's novelity in practical reliability.

ABSTRACT

Monitoring vital signs like ECG, heart rate, blood oxygen level (SpO2), and Temperature are essential to detect any abnormal health condition. existing monitoring systems are expensive and rely on hospital-grade equipment. This creates a clear need for an affordable, lightweight, and IoT-enabled device that allows continuous remote health monitoring for regular users, athletes, elderly persons, and patients. The main purpose of making this device is to make monitoring health more affordable and easily portable. This device can measure ECG waveform, heart rate, SpO_2, and body temperature in real time, display the waveform and data in the OLED display, send data to the cloud using WIFI, and user can check their vitals on their phone screen using Blynk IOT. This device is built with ESP8266 and the sensors used here, MAX30102 for heart rate and SpO_2, AD8232 for ECG waveform, and DS18B20 for temperature. This prototype measures and displays ECG waveform representing electric bits in the heart, Heart rate (BPM), Blood oxygen saturation (SpO_2), and Body temperature (°C) . This device transmits all vitals to the Blynk app. Lead-off detection helps users identify loose ECG electrodes. The heart rate and SpO2 are 98% accurate. This system provides an effective, low-cost solution to continuous health tracking, suitable for home use and portable. Especially more essential if there is an elderly person at home who requires continuous vitals tracking. For future implementation, we can use machine learning to analyze ECG patterns and predict arrhythmia, tachycardia, and bradycardia. We can also build a dedicated health dashboard to track daily/weekly trends of ECG, heart rate, temperature, and SpO_2. An alert system if the vitals fall. Overall, the project demonstrates that low-cost embedded hardware can be used to create an efficient and continuous health monitoring solution. It provides a foundation for future development into a more advanced clinical-grade diagnostic tool.

ABSTRACT

Corrosion of aluminium alloys presents a major challenge in industrial and civil applications. Traditional protective methods, such as chromate- or epoxy-based coatings, pose environmental hazards due to their toxicity and limited recyclability. Zinc oxide (ZnO) nanoparticles are emerging as a sustainable material for corrosion protection because of their chemical stability, UV-blocking ability, and semiconducting nature. ZnO nanoparticles are produced by Aqueous Green Synthesis a Bottom-Up approach method. This review summarizes research progress on the incorporation of ZnO nanoparticles into polymer matrices, specifically polypropylene (PP). PP is valued for its recyclability, flexibility and hydrophobicity, while ZnO is known to enhance adhesion, mechanical strength, and corrosion resistance. Reported results highlight high performance, including corrosion efficiency up to 98%, polarization resistance values exceeding 90,000 omega cm^2, and contact angles above 140·degree for optimized ZnO-polymer coatings. This review discusses the mechanisms, performance evaluation, and fabrication methods of these coatings, emphasizing the potential of PP-ZnO nanoparticle as eco-friendly, high-performance protective layers for aluminium alloys.

ABSTRACT
Calcium phosphate materials have attracted significant attention in recent years owing to their wide range of applications. Their chemical resemblance to the mineral phase of calcified tissues, combined with their biocompatibility and biodegradability, makes them excellent candidates for bone and dental substitution. The ion-exchange properties resulting from the wide variety of anionic and cationic substitutions tolerated by their crystal structures have also been extensively exploited in analytical chemistry. Moreover, due to the coexistence of both acidic and basic surface sites, calcium phosphates have been studied as efficient catalysts for numerous chemical reactions. This work investigates the use of amorphous and apatitic tricalcium phosphate for purifying aqueous solutions initially containing metal ions. The experimental approach involves introducing either amorphous or apatitic tricalcium phosphate into separate aqueous solutions of Cu^{2+}, Co^{2+} and Ni^{2+} salts. After varying contact times, the phosphate solids are separated from the solutions and characterized using X-ray photoelectron spectroscopy (XPS), X-ray diffraction (XRD), and Fourier-transform infrared spectroscopy (FTIR). These analyses demonstrate the high capacity of both amorphous and apatitic phosphates to remove metal ions from solution. The elimination mechanism primarily involves ion exchange between calcium ions in the phosphate and metal ions in solution. In the case of nickel, this exchange occurs without significant alteration of the apatitic structure. In contrast, for cobalt and copper, the exchange process is accompanied by substantial structural modifications of the original phosphate phase.
Keywords: Amorphous calcium phosphate, Apatitic Calcium Phosphate, Dissolution-Precipitation, Exchange Ions.

TOWARDS A SUSTAINABLE AGRICULTURAL REVOLUTION WITH COGNITIVE SYSTEMS

Dr. S. Lakshmi
SRM Institute of Science and Technology, Kattankulatur

ABSTRACT

The world population grows tremendously and it is expected to touch 9 billion by 2037. It is predicted that the population will reach 10 billion in the year 2060. The rapid growth in the world-wide population makes the researchers to think about food production by considering the inefficiency of traditional systems due to climate change and the loss in biodiversity. The basic things of food, water, clothing and shelter are necessary to all human beings become a challenging task even though we are in technological era. The Government of India promotes the sustainable agriculture in various angles like improving the quality of crop seeds, crop rotation, usage of water in an effective way, soil management and soil health monitoring by raising the fund to proper utilization of resources such as drones and artificial intelligent based crop growth monitoring system with IoT. This work explains the various cognitive systems which involve machine learning, deep learning, artificial intelligence, IoT, data analytics, predictive analytics and so on. This work also highlights the challenges in the technology and ethics to reshape the agriculture into a sustainable and effective domain for providing food security in future.

Keywords: Artificial intelligence, Machine learning, Deep learning, Predictive analytics, food security and sustainable agriculture

CROSS VENTILATION IN DESERT HOMES: SPATIAL STRATEGIES FOR PASSIVE COOLING IN BISKRA.

ABSTRACT

This paper deals with examining a passive cooling tool of cross ventilation in the housing of the south east Algerian desert city of Biskra which is an arid city with intense heat, low humidity and little wind circulation in it. Evaluation of the use of space and architecture in vernacular housing and modern housing determines how design of the building, direction, location of windows, courtyards, and spatial distributions influence air movement and thermal comfort. By using the mixed-method research strategy that involves environmental monitoring, computational fluid dynamics (CFD) model, and occupant survey, the study demonstrates that traditional residential buildings designed against the inward facing appearance, utilizing high thermal mass, favorable opening orientation have far better cross ventilation and comfortable indoor environment than modern housing that largely ignores passive design strategies. The results strongly state the vital importance of spatial awareness and culturally-grounded design interventions toward improving the interior air conditions and minimizing the use of mechanical air-conditioning systems. The study will make an input in the general idea of the discourse on climate-sensitive building in the hot-arid regions by providing scientifically-researched findings on how to incorporate advantageous cross ventilation in contemporary desert residences. Finally, it supports a new design paradigm that balances climate sensitivity, logic in space, and physical comfort of the occupants, as the environmental issues continue to increase.

Keywords: Cross Ventilation; Desert Architecture; Vernacular Housing; Spatial Configuration; Sustainable Residential Design.

SKYSCRAPERS OF SUSTENANCE: INTEGRATING VERTICAL FARMING INTO URBAN ARCHITECTURAL SYSTEMS.

ABSTRACT

Vertical farming has increasingly become one of the most revolutionary foods to sustain the process of food production in urban cities as populations continue to flood the cities, and arable land in the countryside continues to diminish. A combination of vertical farming systems within the urban architectural context of the modern city will be explored in this research not just as an addition to the process of agricultural growth but as the essential part of designing future-proof buildings. In interdisciplinary research comprising of architectural analysis, models of environmental performance display and case study evaluation of such projects as Plantagon CityFarm, Sky Greens, and the Farmhouse Project, the study evaluates the spatial, energy, and resource optimization tactics of vertical agricultural buildings. The data point to the possibilities of hybrid architecture combining food production with living, working, and contributing to cities, which will allow cities to close the food miles, increase food security, and stimulate the flow of closed resources. Other aggravating issues addressed in the study are areas concerning regulatory framework, amount of energy used, and perception by the citizens and the researchers provide recommendations on the design and policy work in making the implementations scalable, context-sensitive. Finally, the study conceives the high-rise construction as a vehicle of ecological resilience and urban food sovereignty, strengthening the position of the building as a versatile ecosystem in times of climate change adaptation.

ABSTRACT

Understanding seasonal air quality dynamics is essential for managing pollution in rapidly developing secondary cities. This study presents a seasonal analysis of fine particulate matter (PM2.5) in Cumilla District, Bangladesh, using the Global High-Resolution Aerosol Product (GHAP) processed within the Google Earth Engine (GEE) platform. The district boundary was simplified for efficient computation, and GHAP daily PM2.5 data were filtered and scaled to obtain physically meaningful concentrations. Seasonal composite maps—winter, pre-monsoon, monsoon, and post-monsoon—were generated through temporal averaging and clipped to the study area. Spatial distribution patterns and seasonal contrasts were visualized using standardized color schemes, while descriptive statistics for each season were derived through region-based reducers. The processed PM2.5 rasters and statistical outputs were exported for further geospatial interpretation in ArcGIS. The results reveal distinct seasonal variability and highlight localized pollution hotspots influenced by land use and meteorological conditions. This study provides the first satellite-driven, seasonally resolved PM2.5 assessment for Cumilla and demonstrates an efficient remote-sensing framework applicable to other data-limited regions for air-quality monitoring and policy support.

ABSTRACT

Gold nanoparticles (AuNPs) have emerged as a cornerstone in the field of bionanotechnology due to their unique physicochemical properties, biocompatibility, and ease of surface modification. These nanoscale materials can be synthesized through a variety of methods, including chemical reduction, biological synthesis, and physical techniques, each influencing particle size, shape, and stability. The tunable optical and electronic characteristics of AuNPs, such as surface plasmon resonance, enable their use in advanced biomedical applications including biosensing, drug delivery, imaging, and photothermal therapy. Furthermore, their ability to conjugate with biomolecules—proteins, DNA, and antibodies—enhances their specificity and functional versatility. The stability and inert nature of gold make these nanoparticles ideal for in vivo and in vitro systems, minimizing toxicity while maximizing performance. As research advances, AuNPs continue to revolutionize diagnostics, targeted therapeutics, and regenerative medicine. This integration of nanotechnology and biology marks a significant step toward precision medicine and the development of smart, multifunctional nanoplatforms for future biomedical innovations.

Keywords: Gold nanoparticles, synthesis, surface plasmon resonance, drug delivery, biosensing, bionanotechnology.

PLASTIC POLLUTION And BIODEGRADATION STRATEGIES

R. Kishore

ABSTRACT

Plastic pollution has emerged as a pervasive global environmental challenge, with over 300 million tons of plastic waste generated annually, much of which accumulates in landfills and oceans. Conventional plastics, primarily derived from petroleum, are resistant to natural degradation, leading to long-term persistence in ecosystems. This has dire consequences for marine life, terrestrial organisms, and human health due to microplastic contamination and associated toxic chemicals. Biodegradation, an eco-friendly approach involving the breakdown of plastics by microorganisms, presents a promising solution to this crisis. Various bacteria and fungi, including species of *Pseudomonas*, *Bacillus*, and *Aspergillus*, have demonstrated the ability to degrade polyethylene, polystyrene, and other plastics. Enzymatic degradation, especially through enzymes like laccases and PETases, has shown significant progress in breaking polymer chains into environmentally benign monomers. Recent advancements in genetic engineering and synthetic biology have further enhanced the efficiency of microbial degradation processes. Bioplastics, designed to degrade more readily, also contribute to sustainable waste management. However, biodegradation strategies require optimization to match the rate of plastic production. A multifaceted approach combining biotechnology, improved waste management, and global policy interventions is essential to mitigate plastic pollution and promote environmental sustainability.

Keywords : plastic pollution, biodegradation, micropastic, microbial degradation, genetic engineering.

CANCER CELL DETECTION USING MACHINE LEARNING: A COMPARATIVE STUDY OF KNN, SVM, AND RANDOM FOREST

ABSTRACT

Accurately identifying cancerous cells at an early stage remains one of the most important challenges in medical diagnosis, as timely detection greatly improves treatment planning and patient outcomes. In recent years, machine learning has become a valuable tool for supporting clinicians by offering fast and consistent classification results. This study compares the performance of three commonly used algorithms—K-Nearest Neighbors (KNN), Support Vector Machine (SVM), and Random Forest (RF)—for cancer cell detection using the Breast Cancer Wisconsin Diagnostic dataset. Before training, the dataset was normalized, and relevant features were selected to minimize noise and enhance model performance. KNN was included as a simple reference model, though its results varied depending on feature scaling and the choice of k. SVM with the RBF kernel produced more stable decision boundaries and showed improved separation between benign and malignant cases. Among the three models, Random Forest achieved the strongest overall performance due to its ensemble nature and ability to handle complex feature interactions. The findings suggest that ensemble- and margin-based classifiers provide more reliable results for cancer detection than distance-based methods. Future studies may extend this work by testing deep learning models or combining multiple algorithms to further enhance diagnostic accuracy.

Index Terms: Cancer cell detection, machine learning, medical diagnosis, Support Vector Machine (SVM), Random Forest (RF), K-Nearest Neighbors (KNN), classification.

SYNERGISTIC ACTIVATION OF SOLAR PHOTOCATALYSIS AND OXIDANTS FOR RAPID DETOXIFICATION OF INDUSTRIAL EFFLUENTS

Rozina Khattak
Department of Chemistry, Shaheed Benazir Bhutto Women University,
Peshawar 25000, Pakistan
Email: rznkhattak@yahoo.com

ABSTRACT

This study investigates the solar-driven degradation of Acryl Brilliant Green (ABG), a carcinogenic and persistent dye commonly found in industrial wastewater, using advanced oxidation processes. Silver oxide (Ag_2O) microparticles (MPs) were synthesized via an eco-friendly and cost-effective green route and exhibited notable photocatalytic activity under natural sunlight, achieving approximately 83% dye degradation within 3 h. The introduction of peroxydisulfate (PS) as a co-oxidant significantly enhanced the photocatalytic performance, creating a strong synergistic effect that enabled complete ABG removal within just 21 minutes. This enhancement is attributed to the efficient activation of PS by Ag_2O under solar irradiation, generating highly reactive sulfate and hydroxyl radicals that accelerate the oxidative degradation pathway. Overall, the findings demonstrate that solar/Ag_2O/PS photocatalysis is a robust, sustainable, and energy-efficient approach for removing hazardous organic pollutants, offering valuable insights for the design of environmentally friendly water treatment technologies.

HARNESSING FRUIT AND NUT WASTE FOR THE EFFICIENT BIOSORPTION OF INDUSTRIAL DYE POLLUTANTS

Rozina Khattak
Department of Chemistry, Shaheed Benazir Bhutto Women University
Peshawar 25000, Pakistan
Email: rznkhattak@yahoo.com

ABSTRACT

This study investigates the use of a mixture-based biosorbent, prepared from powdered corncob, almond, pomegranate, walnut, and peanut peels and shells, for the removal of triphenylmethane dyes from aqueous solutions. The biosorbent demonstrated high adsorption efficiency, cost-effectiveness, and environmental compatibility. Under optimized conditions; an adsorbent dosage of 0.3 g, an initial dye concentration of 300 ppm, and a contact time of 50 seconds; up to 98% dye removal was achieved, indicating rapid adsorption kinetics and substantial adsorption capacity. The adsorption process was influenced by solution pH, contact time, and dye concentration, suggesting that both electrostatic interactions and surface functional groups of the biosorbent contribute to dye binding. The study highlights that converting agro-industrial waste into functional biosorbents provides a sustainable, eco-friendly, and easily accessible approach for the treatment of industrial effluents. These findings offer practical insights for scaling up waste-based biosorption technologies for water purification and environmental remediation.

ASSESSING ANTHROPOGENIC IMPACTS ON THE KENITRA COASTAL DUNE CORDON (1999–2025): A REMOTE SENSING AND GIS STUDY

ABSTRACT

In Kenitra Province, a notable dune-cordon system stretches about 70 km between Sidi Taibi and Moulay Bousselham. These dunes protect the fertile Gharb Plain from marine forces and support various socioeconomic activities. However, they face growing pressures from human activities. This study employs multi-temporal remote sensing and GIS analyses to quantify land-use dynamics across the dune cordon between 1999 and 2025.We processed Landsat 7 ETM+ (1999) and Sentinel 2 (2025) imagery, applying atmospheric correction, orthorectification, cropping, and reprojection, and conducted supervised Maximum Likelihood classification in ENVI. Through this approach, six thematic classes were delineated: open field agriculture, greenhouse agriculture, forest, natural vegetation, bare lands, and foredune-beaches. Training sites were selected using field surveys, very-high-resolution imagery, and ancillary data. Subsequently, the accuracy assessment of the land use maps showed overall accuracy rates of 91.06% for 2025 and 88.5% for 1999. The kappa coefficients were 0.89 for 1999 and 0.85 for 2025. Change detection analyses indicated a significant growth in agriculture, with cultivated land increasing from 753.5 ha in 1999 to 2,896.3 ha in 2025. This included a rise of 513 ha in greenhouse operations. Bare lands shrank from 4,163.8 ha to 1,635.5 ha. Forest cover also dropped by 964 ha. Such transformations can upset the dune system. They boost wind erosion and change sediment movement. Our findings point to the need for improved land-use planning and sustainable management. It is essential to balance agricultural expansion with the protection of dune ecosystem services. By identifying key transformation zones, this work sets the stage for focused conservation efforts and policy changes to protect the Kenitra coastal dunes.

Keywords: Coastal dunes, Land-use change, Erosion, Remote sensing, GIS.

FLOOR-LEVEL PREDICTION IN MULTI-STOREY MOSQUES USING INTERPRETABLE MACHINE LEARNING: A CASE STUDY FROM DHAKA, BANGLADESH

ABSTRACT

Floor number is crucial for assessing the indoor climate in naturally ventilated multi-storey mosques. This is because it affects airflow, comfort levels, and environmental factors distributed throughout the building. Traditional evaluation methods generally ignore the effect of floor height. This is especially true in Dhaka, Bangladesh, where limited floor areas, overcrowding, and poor ventilation cause significant variations across floors in multi-story mosques. This study examines the impact of floor level on indoor conditions and identifies the key variables that contribute to differences across floors. A total of 415 data samples were collected through field surveys, including demographic parameters (age, gender, and clothing level) and environmental parameters (temperature, humidity, wind velocity, and lighting level). Three machine learning (ML) models, Decision Tree (DT), Random Forest (RF), and XGBoost, were used in the analysis. The performance of the models was assessed using the coefficient of determination (R^2), Mean Squared Error (MSE), and Root Mean Squared Error (RMSE). The importance of each feature was also evaluated using a permutation-based ranking method. All models achieved accuracies over 70%, and permutation analysis showed that temperature, humidity, and CO_2 were the most critical parameters affecting mosques. The results suggest that ML models can effectively explain the distribution of floor levels in multi-storey mosque environments. This study can help improve ventilation planning, manage crowd movement, and support the design of sustainable multi-storey mosques. Future research should use real-time sensors and gather data across different seasons and various types of mosques.

ABSTRACT

Centrifugal pumps remain among the most widely used fluid-handling machines, and their operational efficiency is closely linked to global energy demand. In low-specific-speed pumps, hydraulic performance is particularly sensitive to internal flow structures, which are strongly influenced by impeller geometry. Previous experimental investigations have shown that incorporating gaps in impeller blades may improve energy characteristics in low-specific-speed designs. To further clarify the mechanisms responsible for these improvements, the present study focuses on the numerical analysis of internal flow behavior in several gap-blade impeller configurations. Computational fluid dynamics simulations were performed using a three-domain model comprising the suction pipe, impeller, and volute casing. Unstructured meshes with near-wall refinement were generated in Ansys Meshing 2023 R1, while steady-state flow fields were computed in Ansys CFX using the k–ω SST turbulence model. The analysis enabled the evaluation of hydraulic head, pressure distribution, velocity fields, and local flow instabilities under nominal (BEP) conditions. Four impeller variants were investigated: a reference impeller with continuous blades (*W0*) and three modified designs incorporating blade gaps at different locations (*W5* – gap toward the pressure side, *W6* – gap toward the suction side, and *W7* – double-gap configuration). The results reveal significant differences in internal flow patterns among the analyzed rotors. The reference impeller *W0* exhibits recirculation near the suction side and pronounced pressure gradients, contributing to increased hydraulic losses. In contrast, the *W5* configuration demonstrates improved streamline alignment, reduced separation, smaller low-pressure regions, and a smoother pressure rise, corresponding to enhanced energy transfer and higher predicted efficiency. The *W6* and *W7* variants show more irregular velocity fields and lower pressure uniformity, indicating greater susceptibility to flow instabilities and cavitation. Overall, the CFD analysis confirms that the position and configuration of the blade gap strongly affect internal flow structure and energy performance in low-specific-speed centrifugal pumps. The pressure-side gap (*W5*) provides the most favorable characteristics. Further experimental-numerical studies are recommended to support the optimization of future impeller designs.

Keywords: centrifugal pump, low specific speed, gap impeller, CFD

ABSTRACT

Electromyography (EMG) is a significant tool in biomedical engineering and medical diagnosis for evaluating muscle performance, identifying neuromuscular diseases, and guiding rehabilitation. However, the raw EMG signals, which are unfiltered and unprocessed, typically show random spike patterns. To increase signal quality, the study uses a Butterworth bandpass filter and Discrete Wavelet Transform (DWT) to reduce noise while keeping significant muscle activity patterns intact. Due to the high dimensionality and complex temporal patterns of EMG signals, feature extraction is crucial for significant classification. Common features are extracted, which include time-domain and frequency-domain features. Optimized feature selection is necessary for better classification results with two selected foot movements. The optimization of EMG features is conducted using Ant Colony Optimization (ACO), Particle Swarm Optimization (PSO), and Grey Wolf Optimizer (GWO). The optimized features are subsequently used by two classifiers: Support Vector Machine (SVM) and K-Nearest Neighbours (KNN). The classifiers' performance is evaluated in terms of accuracy and computational efficiency. Forty healthy subjects were instructed to perform two selected foot movements, dorsiflexion and plantarflexion, and EMG signals were recorded from the medial head of the gastrocnemius muscle. Experimental results demonstrate that the PSO optimizer performed the best among ACO, PSO, and GWO optimizers for feature selection. The model accuracy was evaluated using SVM and KNN. PSO achieved the highest accuracy of 95% with SVM, indicating its robustness in handling optimized EMG data. The results of the study contribute to designing an optimized EMG-based classification system to provide prosthetic limb control, especially for patients in Bangladesh, offering a more cost-effective solution to foot prosthesis treatment.

Keywords: EMG, Foot Movement, DWT, Feature Selection, PSO, ACO, GWO, SVM, KNN, Prosthetic Control.

ISOLATION OF SAHARAN ACTINOBACTERIA FOR BIOLOGICAL CONTROL AGAINST PHYTOPATHOGENS: TOWARDS SUSTAINABLE AGRICULTURE

Fedwa BEGHDADI*

ABSTRACT

Throughout their lives, plants interact with various organisms, which can negatively or positively impact their health, leading to significant agricultural losses. Biological control, particularly through the use of antagonistic actinomycetes, represents a promising method to combat these phytopathogens. Therefore, this study aims to screen new strains of actinomycetes isolated from Saharan soil, which produce bioactive molecules that inhibit some phytopathogenic agents. For the isolation of Saharan actinomycetes, several soil samples were collected from various oases in Algeria. These samples were treated using the CaCO3 method and subjected to a series of decimal dilutions, and subsequently inoculated onto the CHV medium with or without selective agents, with incubation carried out at 30°C for 21 days. The antimicrobial activity of actinomycetes against these pathogens was assessed using the cross streaking method on ISP2 and YGB mediums. Incubation was done at 30°C for 24 hours for bacteria and up to 3 days for fungi (Aouiche et al 2013). This method of isolation among us has resulted in obtaining a significant number of actinomycete isolates with the potential to inhibit phytopathogenic bacteria and fungi, with the inhibition diameter reaching up to 40mm for some strains on the solid YGB medium. The intensity of the variable activity largely depends on the type or group to which the strains belong. These variations in the number of activities are due to the fact that a strain of actinobacteria can produce several antimicrobial molecules with different modes of action depending on the composition of the culture medium (Berdy, 2005 and 2012). In view of the results obtained, we can consider that our actinomycete isolates have the ability to inhibit certain phytopathogenic agents. The production, extraction, and characterization of these bioactive molecules is the subject of our current research.

Keywords: Actinomycetes, Bioactive molecules, Phytopathogenic agents, Biological control.

ABSTRACT

Pathogenic fungi inflict great damage on plants, leading to their wilting, damage, or death in many cases, by secreting hydrolases that dissolve the cells of the plant tissue on which they feed. Among these plant-pathogenic fungi we find: *Botrytis ceneria*, *Fusarium oxysporum*, *Alternaria*, *Phytophthora infestans* ... these have a negative impact on health, food safety and lead to significant losses. Under certain climatic or storage conditions, these microorganisms can develop and lead to the production of mycotoxins, which can be harmful to the health of animals and humans, causing a number of disorders and even serious illnesses. These toxic metabolites therefore represent a major health problem. Around 25% of food products are contaminated with fungal toxins. The mycoflora is estimated to comprise between 200,000 and 300,000 species. There is therefore a wide diversity of mycotoxins. Of the more than 400 mycotoxins identified, only 30 or so have worrying toxic properties. Some of these toxins are thought to be carcinogenic or mutagenic, while others are toxic to the kidneys, nervous system or liver. It should also be noted that toxicity does not necessarily stem from the mycotoxin itself, but may be due to one of the metabolites produced by its degradation. Several species of micromycetes, mainly belonging to the four genera *Aspergillus*, *Penicillium*, *Fusarium and Alternaria*, are capable of excreting one or more mycotoxins: aflatoxins, ochratoxins, fumonisins, trichothecenes, patulin, zearalenone, alternariols…The lack of sanitary controls, poor food packaging (damp, hot, poorly ventilated storage areas) and the absence of strict regulations increase the risk of contamination by these metabolites. The frequency of contamination of foodstuffs available to the public and their mycotoxin content are becoming a serious threat to health.

ABSTRACT

The experiment was carried out to study the effect of different levels of phosphorus and boron on growth and yield of two potato varieties viz. 'Diamant' and 'Lal pakri' at experimental field of the Department of Crop Science and Technology, Rajshahi University, Rajshahi, during the period from November, 2018 to February, 2019. The experiment consisted of two factors; Factor A: Five levels of phosphorus and boron viz. F1 = 0 kg P and 0 kg B per ha,F2=50 kg P and 2 kg B per ha,F3=50 kg P and3 kg B per ha,F4=70 kg P and 2 kg B per ha, Fs=70 kg P and 3 kg B per ha and Factor B:Variety viz.V1 = 'Diamant' and V2 = 'Lal pakri'. The experiment was laid out with Randomized Complete Block Design (RCBD). Plant height (43.24 cm), number of leaves per plant (44.77), leaf length (30.20 cm), tuber length (11.33 cm), girth of tuber (19.33 cm), tuber weight per plant (292.90 g) were found maximum for Diamant variety combined with 70 kg P and 3 kg B per ha and the minimum results were found from Lal pakri variety combined with control treatment. The maximum number of tuber per plant (17.78) was recorded for Lal pakri variety combined with70 kg P and 3 kg B and the minimum result was found from Diamant variety combined with control treatment. In case of variety the highest yield (23.93 ton per ha) was obtained from Diamant variety and lowest yield (15.41 ton per ha) from Lal pakri variety. In case of different levels of phosphorus and boron the highest yield (22.32ton per ha) was found from 70 kg P and 3 kg B per ha and lowest yield (14.24 ton per ha) from control treatment. In case of treatment combinations among varieties with phosphorus and boron, Diamant variety combined with 70 kg P and 3 kg B per ha produced the highest yield (27.12 ton per ha) and the lowest yield (11.63 ton per ha) was obtained from Lal pakri variety combined with control treatment. In case of economic return, the highest cost of production, gross return, net return and benefit cost ratio (BCR) were recorded from Lal pakri variety with 70 kg P and 3 kg B per ha and the lowest was recorded from Diamant variety with control treatment. Considering the above findings, application of 70 kg P and 3 kg B per ha with Diamant variety appeared to be suitable for cultivation for high yield and the same levels of phosphorus and boron with Lal pakri variety for high economic return of potato.

GENOME-WIDE META-QTL ANALYSIS UNCOVERS STABLE LOCI UNDERLYING FRUIT TRAITS, PLANT MORPHOLOGY, ANTHOCYANIN REGULATION, AND BIOTIC STRESS RESISTANCE IN EGGPLANT

ABSTRACT

Eggplant, a low-calorie vegetable rich in dietary fiber, essential vitamins, minerals, and polyphenolic compounds, has substantial nutritional and medicinal value. Meta-QTL analysis provides a powerful framework for identifying stable genomic regions that control quantitatively inherited traits by integrating QTL information from diverse studies conducted across different environments and genetic backgrounds. This research represents the first comprehensive meta-analysis in eggplant, targeting morphological, biochemical, fruit-quality, prickliness and biotic stress-related traits. The objective was to narrow down consensus genomic intervals and identify potential candidate genes relevant to these traits, thereby strengthening their application in breeding strategies. Using common markers in BioMercator

v4.2, published QTLs were put together based on LOD, PVE, and confidence interval (CI) criteria and then projected onto a consensus genetic map. Out of all collected QTLs, 391 (63.06%) were successfully projected onto a high-density consensus map, resulting in the identification of 84 meta-QTLs (MQTLs). The final MQTLs displayed an average CI of 7.1 cM, reflecting a 30.72% reduction from the initial average CI of 10.29 cM, thereby improving the precision of trait localization. Synteny and orthology analyses identified strong candidate genes within key MQTL regions. Functional annotations, including domain characterization, GO enrichment, and KEGG pathway analysis, highlighted conserved protein motifs and pathways related to regulation, metabolism, secondary metabolite production, and defense responses. Evidence from previous GWAS further validated the importance of several MQTLs. Overall, integrating markers tightly linked to these MQTLs can enhance genomic selection and strengthen marker-assisted breeding efforts in eggplant.

ABSTRACT

Reversible Data Hiding in Encrypted Images (RDH-EI) plays a vital role in secure image management, particularly in cloud computing environments where data confidentiality and integrity are crucial. This project presents a high-capacity RDH-EI technique that embeds additional data into encrypted grayscale images while ensuring the original image can be perfectly recovered. The proposed method employs Edge-Directed Prediction (EDP) and Multi-MSB Self-Prediction, which together enhance embedding accuracy and capacity. EDP leverages edge information for precise pixelprediction, while Multi-MSB Self-Prediction refines embedding by utilizing multiple significant bits of pixels. The framework follows a three-step process: encryption of the original image, data embedding in the encrypted domain, and reversible data extraction with perfect image recovery. To further strengthen security, an OTP-based user authorization system is integrated, preventing unauthorized access and safeguarding sensitive data.The method achieves high embedding capacity, secure data protection, and lossless recovery, makingit suitable for applications such as medical imaging, cloud storage, and defense communication, where both data security and reversibility are essential.

ABSTRACT

Filamentous fungi have been considered as factory for the production of valuable products in submerged fermentation. High growth rate and ability to utilize complex substrates make them superior than other microorganisms. However, their morphology in submerged fermentation is a big challenge in fermentation industry. Growth and morphology of a filamentous fungus, *Aspergillus oryzae* SBS50 was studied in submerged fermentation in the presence of microparticles. Addition of microparticles, viz. talc powder and aluminum oxide enhanced the production of various hydrolytic enzymes i.e. phytase, cellulase, xylanase and amylase significantly. The morphology of the fungus was also engineered by these microparticles during the production of hydrolytic enzymes. The size of fungal pellet was reduced up to 90% by the addition of microparticles. There was reduction in fermentation time from 96 h to 72 h. Reduction in fermentation time increased the productivity of the hydrolytic enzymes. Microparticles engineered the fungal morphology with concomitant increase in production and productivity of hydrolytic enzymes in submerged fermentation.

BIOLOGICAL CONTROL POTENTIAL OF GREEN LACEWINGS AND COMB-FOOTED SPIDER ON FALL ARMYWORM (*SPODOPTERA FRUGIPERDA*) AND SCREENING NATURAL ENEMIES OF FALL ARMYWORM BY USING MOLECULAR GUT CONTENT ANALYSIS

ABSTRACT

The fall armyworm is an invasive and highly destructive agricultural pest which has the ability to invade a wide range of crops with polyphagous feeding behaviour. Biological control agents are employed to control fall armyworm in order to reduce reliance on chemical insecticides. Currently, several biological control agents are being used to manage fall armyworm, and among them generalist predators are getting more recognition as their broad range of predation ability. But predators-prey dynamic interactions and environmental DNA (eDNA) metagenomic analysis to detect prey preference in their diets research are underexplored. This research evaluated the predatory efficacy and intraguild effect two generalist predators on the fall armyworm with eDNA metagenomic analysis for natural enemies screening. In this study we used comb-footed spiders (Theridiidae sp.) and green lacewings larvae (*Mallada signatus*). Spiders and green lacewings larvae were tested individually and in combination with fall armyworm. We investigated predation efficacy and the intraguild predation effect on fall armyworm. The results revealed that both predators significantly reduced fall armyworm numbers individually or in combination. Predation capability of the predators is strongly influenced by prey size. Green lacewing larvae are most effective at preying on first and second instar and spiders entangled up to third instar larvae of fall armyworm. It was found that third instar larvae were not engulfed by green lacewing larvae but dead of third instar larvae cause to happen by biting of larvae of green lacewings. Intraguild predation was found between generalist predators that was not detrimental to fall armyworm control. Molecular gut content analysis of generalist predators revealed three fall armyworm species, viz. *Spodoptera frugiperda*, *Spodoptera litura*, and *Spodoptera exigua*. Molecular investigations confirmed that the generalist predator preys upon fall armyworms, and ecological experiments showed that the predators effectively consume them. The results of this study demonstrated that generalist predators might be able to lower falls throughout the early stages of development.

ÖZET
Cıvata üretiminde yoğun olarak kullanılan yöntemlerden birisi de sıcak şekillendirme tekniğidir. Bu üretim tekniğinde indüksiyon cihazlarında ısıtılan alaşımlı çelikler dövme presinde cıvata şekline gelmektedir. Sıcak şekillendirme tekniği ile cıvata üretiminde friksiyonlu presler yoğun olarak kullanılmaktadır. Friksiyonlu preslerin yoğun olarak kullanılması, presteki aksamların çabuk olarak aşınmasını sağlamaktadır. Bu parçalardan biri de preslerin balata sistemleridir. Bu proje, sıcak cıvata dövme hatlarında kullanılan friksiyonlu preslerin balata montaj sisteminin mekanik açıdan iyileştirilmesi sağlanmıştır. Eski sistemde balata, volanın bir tarafına sabitlenip diğer tarafından gerdirilerek takıldığından dolayı sürtünme kuvveti dengesiz dağılmakta, bu da düzensiz aşınmaya, enerji kayıplarına ve uzun bakım sürelerine yol açmaktaydı. Yapılan iyileştirme kapsamında, volan çevresine 20 adet cıvata eklenerek balata dış yüzeye eşit gerginlikte monte edilmiştir. Böylece, balatanın tüm yüzeyinde homojen sürtünme sağlanmış hem mekanik verimlilik hem de dayanıklılık artırılmıştır. Balata sistemindeki bu yeni ve inovatif tasarımla balata değişim süresi 8 saatten 2 saate düşmüş olup, balata ömrü %100 artmış, düzensiz aşınma tamamen ortadan kalkmıştır. Bu önemli gelişme ile birlikte pres duruş süreleri %75 azalmış, üretim sürekliliği ve proses güvenilirliği sağlanmıştır. Ayrıca enerji verimliliğinde belirgin iyileşme ve bakım maliyetlerinde kayda değer azalma elde edilmiştir. Sonuç olarak, proje hem operasyonel verimliliği hem de ekonomik sürdürülebilirliği güçlü biçimde desteklemiş; preslerin daha stabil, güvenilir ve enerji açısından verimli çalışmasını sağlamıştır.

LINING IMPROVEMENT PROJECT IN HOT BOLT FORGING FRACTION PRESSES

ABSTRACT

One of the most commonly used methods in bolt production is hot forming. In this production technique, alloy steels heated in induction devices are formed into bolts in a forging press. Friction presses are widely used in bolt production using hot forming. The extensive use of friction presses results in rapid wear of press components. One of these components is the press's pad systems. This project provides a mechanical improvement to the pad mounting system of friction presses used in hot bolt forging lines. In the old system, the pad was fixed to one side of the flywheel and tensioned from the other, resulting in uneven distribution of friction force, leading to uneven wear, energy losses, and extended maintenance times. As part of this improvement, 20 bolts were added around the flywheel and the pad was mounted to the outer surface with equal tension. This ensures uniform friction across the entire surface of the pad, increasing both mechanical efficiency and durability. With this new and innovative design in the brake pad system, brake pad replacement time has been reduced from 8 hours to 2 hours, brake pad life has been increased by 100%, and irregular wear has been completely eliminated. This significant improvement has reduced press downtime by 75%, ensuring production continuity and process reliability. Furthermore, significant improvements in energy efficiency and a significant reduction in maintenance costs have been achieved. As a result, the project has significantly boosted both operational efficiency and economic sustainability, ensuring more stable, reliable, and energy-efficient press operation.

ABSTRACT

The antioxidant capacities of 18 pharma-grade cosmeceutical oils was evaluated using the DPPH radical-scavenging assay. The tested materials included fixed oils (moringa, avocado, black cumin, pomegranate, castor, macadamia, baobab, marula, jojoba, grape seed), essential oils (tea tree, peppermint, eucalyptus), phenolic-associated oils (bakuchiol, tamanu, black garlic), and squalene. Each oil was evaluated at concentrations of 0.5, 2.5, and 5 µg/mL, and antioxidant activity was determined using a 1 mM DPPH solution. Absorbance was recorded at 517 nm, and all measurements were performed in duplicate. Fixed oils demonstrated the strongest antioxidant capacity, with Moringa oleifera seed oil showing the highest inhibition (82.78% at 5 µg/mL), followed by avocado (55.73%), black cumin (41.56%), and pomegranate seed oil (42.78%). This study reports the first known DPPH antioxidant measurements for moringa (showed the highest antioxidant capacity) and baobab seed oils expanding current knowledge regarding their bioactive potential. Our findings highlight that lipid-compatible assays selectively favor lipophilic antioxidants, positioning fixed oils as superior candidates for incorporation into oil-based cosmeceuticals and provide a robust experimental foundation for future pharmaceutical investigations.

ABSTRACT

Optimal design of the fuzzy logic controller (FLC) for an automatic voltage regulator (AVR) is crucial due to its direct impact on power system stability, voltage quality, and generator performance. The AVR is responsible for maintaining the generator terminal voltage within acceptable limits despite load disturbances, nonlinearity, and environmental variations. While conventional PID-based AVR systems are widely used, they suffer from significant limitations, such as voltage overshoot, slow dynamic response, and sensitivity to parameter changes. This research presents the application of a Fuzzy Logic Controller (FLC)-based Automatic Voltage Regulator (AVR) system. The AVR is a device to control the reactive power and hold the terminal voltage of the synchronous generator at safer limits. In this paper, an FLC-based AVR system is analysed with triangular membership functions (MF). Two inputs, error voltage and change in error voltage, are considered as inputs of the FLC. In this study, triangular MF is considered, and the performance of the fuzzy AVR system with different proportional integral derivative (PID) controllers in the literature is checked. It is found that the proposed FLC-based AVR system reflects better performance in comparison to the PID controller-based AVR system. To overcome these problems, a Mamdani-type FLC employing triangular membership functions (MFs) is designed. Two inputs—voltage error and change in error—are utilised to generate a robust control action without the need for an accurate mathematical model. The performance of the proposed fuzzy-based AVR system is evaluated and compared with several optimised PID controllers. Keywords: Automatic Voltage Regulator (AVR), Fuzzy Logic Controller (FLC), PID Controller, Mamdani Inference, Power System Stabilisation, Voltage Regulation.

ABSTRACT

Industrial control systems, such liquid-level and thermal heater operations, typically confront aggravating challenges such as overshooting their targets, delayed recovery times, and inconsistent results. These difficulties become most obvious when utilizing classic PID (proportional-integral-derivative) controllers, which must be carefully calibrated by hand and don't always cope well with changes or complex system behaviors. This research approaches those problems by comparing a standard PID controller to a Mamdani-type fuzzy logic controller, applying each to two simple process models constructed from basic concepts. Both controllers are implemented and tested in simulation: the PID is tuned using standard methods and adjusted for better performance, while the fuzzy logic controller for the heater uses triangular membership functions plus custom rules to limit overshoot and speed up stabilization. Through step changes and performance tests, the study finds that fuzzy logic can give smoother, more controlled transitions and cut down on overshoot in several scenarios, while PID controllers tend to react quickly but may cause more fluctuations at low setpoints. The results point to fuzzy logic as a sensible way to handle situations where PID falls short and suggest future work on combining or adapting these approaches for even better stability and flexibility in real operations.

ÖZET

Lityum iyon bataryalar günlük hayatımızda birçok farklı alanda çok yaygın olarak kullanılmaya başlanmıştır. Lityum iyon bataryalar günümüzde elektrikli ev aletlerinden, elektrikli iş aletlerine ve elektrikli araçlara kadar geniş bir yelpazede kullanılmaktadır. Bunun altında hiç şüphesiz lityum iyon bataryaların sunmuş olduğu yüksek enerji yoğunluğu, hızlı deşarj ve yüksek pil ömrü gibi avantajları yatmaktadır. Bu avantajlara rağmen lityum iyon bataryaların performansları sıcaklığa göre değişim göstermekte, düşük ve yüksek sıcaklıklarda verimleri önemli ölçüde düşmektedir. Lityum iyon bataryalar 15°C-40°C sıcaklık aralığında optimum çalışma sağlamaktadırlar. Diğer bir yandan lityum iyon bataryaların oluşturduğu batarya modülleri homojen sıcaklıkta olmalı ve modül içindeki sıcaklık farkı 5°C'yi aşmamalıdır. Lityum iyon bataryaları bu optimum çalışma sıcaklığı aralığında tutmak için kullanılan batarya termal yöntem sistemlerinin başında ise dışarıdan ilave bir enerji gereksinimi doğurmayan faz değiştiren malzemeler (FDM) gelmektedir. FDM'ler faz değişimleri esnasında gizli ısı çekerek sıcaklığı sabit tutmakta ya da sıcaklık artışını baskılayıcı etki oluşturmaktadır. Bu çalışmada batarya termal sistemlerinde yaygın olarak kullanılan RT35HC faz değiştiren malzemesi ile oluşturulan sistem ve doğal taşınımlı sistemin entropi üretimleri sayısal olarak hesaplanmış ve sonuçlar karşılaştırılarak batarya sisteminde FDM kullanılmasının entropi üretimine etkisi sayısal olarak incelenmiştir. Batarya deşarj hızı olarak 3C deşarj hızı, ortam sıcaklığı olarak 20°C ortam sıcaklığı, batarya tipi olarak 22650 tip silindirik lityum iyon batarya, 4 mm FDM kalınlığı ve 1 mm alüminyum hazne kalınlığı seçilmiştir. Sınır şartı olarak tabanın adyabatik, dış yüzeylerden ise ısı transfer katsayısı h=5 W/m^2K olacak şekilde taşınım olduğu kabul edilmiştir. Sonuçlar FDM kullanılması durumunda sisteme giren entropinin 5,64 J/K'den 6,27 J/K'e, sistemdeki entropi değişiminin 3,23 J/K'den 5,01 J/K'e çıktığını, batarya sıcaklığının 344,8 K'den 309,3 K'e, sistemden çıkan entropinin 2,66 J/K'den 1,38 J/K'e, entropi üretiminin ise %54 azalarak 0,25 J/K'den 0,11 J/K'e düştüğünü göstermiştir.

Anahtar Kelimeler: Batarya termal yönetimi, FDM, Entropi üretimi, Lityum iyon batarya

NUMERICAL INVESTIGATION OF THE EFFECT OF RT35HC PHASE-CHANGING MATERIAL ON ENTROPY PRODUCTION IN BATTERY THERMAL SYSTEMS

ABSTRACT

Lithium-ion batteries have become widely used in many different areas of our daily lives. Today, lithium-ion batteries are used in a wide range of applications, from electric household appliances to electric tools and electric vehicles. Undoubtedly, this is due to the advantages offered by lithium-ion batteries, such as high energy density, fast discharge, and long battery life. Despite these advantages, the performance of lithium-ion batteries varies with temperature, and their efficiency decreases significantly at low and high temperatures. Lithium-ion batteries provide optimal performance in the 15°C-40°C temperature range. On the other hand, the battery modules formed by lithium-ion batteries must be at a homogeneous temperature, and the temperature difference within the module must not exceed 5°C. Phase change materials (PCMs), which do not require additional external energy, are among the leading battery thermal management systems used to maintain lithium-ion batteries within this optimal operating temperature range. PCMs absorb latent heat during phase changes to maintain a constant temperature or suppress temperature increases. In this study, the entropy production of a system created using the RT35HC phase change material, which is commonly used in battery thermal systems, and a natural convection system were calculated numerically. The results were compared to numerically examine the effect of using PCM in battery systems on entropy production. The battery discharge rate was set to 3C, the ambient temperature to 20°C, the battery type to a 22650 cylindrical lithium-ion battery, the PCM thickness to 4 mm, and the aluminium tank thickness to 1 mm. As boundary conditions, the base was assumed to be adiabatic, and convection was assumed to occur from the outer surfaces with a heat transfer coefficient of h=5 W/m²K. The results show that when PCM is used, the entropy entering the system increases from 5.64 J/K to 6.27 J/K, the entropy change in the system increases from 3.23 J/K to 5.01 J/K, the battery temperature decreased from 344.8 K to 309.3 K, the entropy leaving the system decreased from 2.66 J/K to 1.38 J/K, and entropy production decreased by 54%, from 0.25 J/K to 0.11 J/K.

ABSTRACT

Light-Fidelity (LiFi) is a new technology that seems potential for high-speed wireless communication, providing enhanced data rates and secure transmission in optical wireless channels. This study presents a comprehensive performance evaluation and trade-off analysis of three widely used multi-level modulation schemes-Pulse Amplitude Modulation (PAM), Quadrature Amplitude Modulation (QAM), and Continuous Phase modulation (CPM)-in a high-speed LiFi system. In this work, several performance aspects of the LiFi link were examined, such as the achievable data rate, the usable communication distance, the signal-to-noise ratio (SNR), the bit error rate (BER), and the overall spectral efficiency. To evaluate the system, the experiments were carried out under practical indoor channel conditions. From the measurements, the LiFi setup was able to sustain data rates of up to 5 Gbps across a 10-meter path. The comparison among the modulation formats shows that QAM delivers the highest data throughput when the transmitter and receiver are placed at moderate distances, while CPM maintains lower BER when the link is extended. PAM behaves differently from the other two schemes. While it does not deliver the highest data rate or the lowest error level, it is easier to implement, and this makes it a practical option in situations where hardware simplicity is important. From the overall results, it becomes clear that the SNR, the link distance, and the achievable data rate are closely related, and changing one of them affects the others. The comparison also shows the limits of each modulation scheme in a real LiFi setup. These findings can help researchers and engineers decide which modulation approach is more suitable when designing or upgrading high-speed LiFi systems.

ABSTRACT
A promising method for enhancing biological activity and fortifying plant defense mechanisms is the combination of endophytes with nanoparticles. Endophytes can serve as carriers that improve the stability and distribution of green nanoparticles within plant tissues as well as biofactories for their manufacture. Endophytes and nanoparticles exhibit synergistic benefits when combined, such as higher resistance to biotic stressors, improved plant growth promotion, and enhanced antimicrobial efficacy. By lowering chemical inputs and improving treatment efficacy, this integrated method also promotes sustainable agriculture and pharmaceutical uses. The synergistic mechanisms and new uses of the endophyte-nanoparticle combination are highlighted in this brief overview.
Keywords: Endophytes, Nanoparticles, Eco-friendly, Synergy, Antimicrobial, Sustainable.

ABSTRACT

Mahasthan, which is one of the most significant archaeological and cultural heritage sites in Bangladesh, is gradually becoming threatened by the developmental pressures of rapid urbanization, agricultural encroachment and environmental change. Although it is important, there has been little reliable and recent scientific research conducted under modern geospatial methods and techniques. In this study, a comprehensive archaeological monitoring and risk assessment framework is built through the combination of Geographic Information Systems (GIS), remote sensing, Digital Elevation Models (DEMs) and multi-temporal spectral indices (NDVI, NDBI, NDWI) to analyze the process of changes in land use and land cover (LULC) in the areas, topography and environmental changes compared between 1995 and 2025.The analysis demonstrates a significant decrease in the dense vegetation cover and permanent water bodies as well as a steady growth in the built-up areas with the resultant change in ecological balance. The analysis demonstrates a significant decrease in the dense vegetation cover and permanent water bodies as well as a steady growth in the built-up areas with the resultant change in ecological balance. High-risk sites, such as Mankalir Kunda Mound and Bairagi Bhita are predominantly associated with anthropogenic encroachment, vegetation loss and hydrological stress. The study provides evidence-based insights for heritage zoning, prioritizing conservation actions and implementing sustainable management strategies to safeguard *Mahasthan's* long-term preservation.

Keywords: Heritage, Archaeological Site, Environmental Monitoring, Geospatial, Risk Zoning.

A COMPARTMENTAL MATHEMATICAL MODEL FOR UNDERSTANDING HEART DISEASE DYNAMICS AND PREVENTION

ABSTRACT

Heart disease persists as a significant contributor to global mortality rates, thus mandating the formulation of effective strategies centered on transmission, prevention, and control. This study investigates a compartmental mathematical model aimed at analyzing the dynamics related to heart disease transmission, integrating both lifestyle-associated and genetic risk factors. The model consists of six distinct compartments that signify various phases in the progression of the disease. We employ analytical techniques to validate the model's uniqueness and accuracy, ascertain the threshold at which the disease ceases to propagate, and compute the basic reproduction number utilizing the next-generation matrix approach. We demonstrate the global stability of the disease-free equilibrium through the application of Lyapunov fuction using Lasalle's invariance principle. Numerical simulations were performed to reinforce the analytical findings and illustrate the effectiveness of control measures intended to reduce the reproduction number. The findings underscore the critical importance of focusing on heart disease prevention and lifestyle modifications, thereby providing a comprehensive framework for the development of public health initiatives.

Keywords: Heart disease, lifestyle-associated, genetic risk factors, next-generation matrix, Lyapunov fuction.

SMART WEARABLES FOR HEALTH MONITORING USING NANOTECHNOLOGY

ABSTRACT

Smart wearables have emerged as powerful tools in modern healthcare, offering continuous, non-invasive, and real-time monitoring of vital physiological parameters. The integration of nanotechnology has significantly enhanced the performance, sensitivity, and miniaturization of these devices. This paper highlights the design, development, and applications of nano-enabled wearable systems for advanced health monitoring. Nanomaterials such as graphene, carbon nanotubes, nano-silver, and polymer nanocomposites enable the creation of highly efficient and flexible sensors capable of detecting subtle biochemical and biophysical changes in the body. These nanosensors, embedded in smart patches, wristbands, textiles, and contact lenses, facilitate the monitoring of heart rate, blood pressure, glucose levels, body temperature, hydration, and respiratory activity. Nanotechnology improves the electrical conductivity, flexibility, biocompatibility, and durability of wearable sensors, making them suitable for long-term use and comfortable integration into daily activities. Recent innovations include nano-based sweat sensors, tear-fluid sensing contact lenses, and transdermal nanosensors capable of real-time molecular detection without invasive procedures. Such advancements support early diagnosis, personalized healthcare, and effective remote patient monitoring. The combination of nanotechnology with IoT, Bluetooth Low Energy (BLE), and artificial intelligence enables smart wearables to analyze and transmit health data instantly. These systems can identify abnormalities, provide alerts, and assist healthcare professionals in decision-making. Cloud-based platforms further enhance data management and telemedicine applications. However, challenges remain in terms of data privacy, long-term biocompatibility, sensor durability, and production costs. Continued research and standardization are essential to ensure the safe and widespread adoption of nano-enabled wearable technologies.

ABSTRACT

Microplastic contamination has emerged as a pervasive threat to aquatic ecosystems globally, presenting significant risks to biodiversity, water quality, and human health. Microplastics, defined as plastic fragments smaller than 5 mm, originate from the breakdown of larger plastic debris and direct sources such as consumer products. Their resilience and minute size facilitate extensive dispersion through rivers, lakes, and oceans, where they are ingested by various aquatic organisms. The present study investigates microplastic concentrations across multiple freshwater sites and examines ecological impacts associated with chronic exposure. Field sampling was conducted in urban and rural water bodies, utilizing spectroscopic identification to characterize microplastics by polymer type. Results show higher concentrations in locations impacted by urbanization and industrial activity. Laboratory assays performed on fish and macroinvertebrate populations revealed microplastic accumulation in biological tissues, associated with decreased reproductive success and altered feeding behaviors. Furthermore, microplastics were found to adsorb persistent organic pollutants and heavy metals, compounding toxicological effects in aquatic food webs. The study underscores the urgent necessity for improved waste management strategies and stricter regulatory controls on plastic emissions. Effective interventions may include the development of biodegradable materials, enhanced public awareness campaigns, and targeted remediation of polluted sites. These findings have broad implications for conservation policy, highlighting the interconnectedness of environmental, social, and economic priorities. Addressing microplastic pollution will require interdisciplinary cooperation, ongoing monitoring, and adaptive management to safeguard freshwater ecosystems for future generations.

ABSTRACT

This study aims to explore the influence of doping concentration (DC) on the structural and optical properties of pristine cupric oxide thin films (PCOTF) and Ni-doped cupric oxide thin films (NDCOTF). The PCOTF and NDCOTF were prepared onto glass substrates through the chemical bath deposition (CBD) technique with various DC of Ni. From FTIR spectra it is noticed that the absorption peaks at 608 and 444 cm^{-1} are assigned to CuO stretching vibrations, confirming the formation of PCOTF and NDCOTF. Ultraviolet–visible spectroscopy analysis revealed that absorbance (A) increased with Ni content but decreased with wavelength. Whereas, the transmittance (T%) of NDCOTF exhibited an inverse trend with respect to A. The highest T% of the PCOTF, approximately 70% in the visible region (VR), was found to be reduced with increasing DC. Furthermore, the refractive index enhanced with DC, attaining a maximum value of 2.64, while the skin depth diminished with higher DC. Meanwhile, the dielectric constant showed a slight increase with increasing DC. The optical band gap energy declined from 3.28 eV to 1.95 eV with increasing Ni content. In addition, reflectance, absorption coefficient, and extinction coefficient showed notable alteration with Ni-incorporation. From all this analysis, it can be predicted that the fabricated NDCOTF becomes suitable for applications in optoelectronic devices.

Keywords: Thin films, CBD, Ni-doped Cupric Oxide, Optical characteristics.

DECODING POLLUTANT TOXICITY USING CRISPR/CAS9 FOR APPLICATIONS IN MODERN ECOTOXICOLOGY

ABSTRACT

Chemicals are widely used in agriculture to control pests and enhance productivity, yet their accumulation and long term presence in the environment pose significant risks to ecosystems and living organisms. With the rapid advancement of analytical technologies and high-throughput screening tools, toxicologists now have more precise methods to examine how these chemicals influence biological systems. Among the emerging tools, the CRISPR/Cas genome-editing system has gained considerable attention for its accuracy, efficiency, and relatively low cost. By enabling targeted modification of specific genes, CRISPR/Cas offers new opportunities to develop crops that are more resilient to chemical stressors and environmental pollutants, thereby helping protect yield losses caused by toxic exposures. In the field of ecotoxicology, CRISPR/Cas technologies are increasingly being applied to investigate how organisms respond to agricultural pollutants, antibiotic contamination, and other environmental threats. Through precise gene manipulation, researchers can identify and study key genetic pathways involved in toxicity responses, allowing a deeper understanding of how pollutants interact with biological systems. This approach not only supports the development of pollutant-resistant crop varieties but also contributes to the discovery of biomarkers and mechanisms relevant to environmental risk assessment. Furthermore, this review discusses the expanding potential of CRISPR/Cas within ecotoxicology, including its role in improving environmental monitoring, enhancing stress tolerance in plants, and reducing dependency on chemical inputs. While the technology offers many advantages, such as specificity and adaptability, it also presents limitations related to off target effects, regulatory concerns, and ecological safety. Overall, CRISPR/Cas represents a promising tool for advancing environmental research and developing sustainable solutions to pollution related challenges.

ABSTRACT

viscosity is estimated using the Green–Kubo formalism through time integration of the autocorrelation function of the off-diagonal components of the microscopic pressure tensor.Further refinement and comparison with experimental datasets are ongoing to improve model consistency. This work aims to establish a reliable molecular dynamics framework for predicting the viscosity of R134a, contributing to the development and evaluation of next-generation refrigerants and working fluids.The prediction of transport properties of refrigerants are essential for the design, optimization, and environmental evaluation of modern cooling and energy systems. Although experimental measurements provide valuable reference data, they are often limited by high costs, difficulties in accessing extreme thermodynamic conditions, and uncertainties at microscopic scales and difficult to find a good data set for simulation. In this context, Molecular Dynamics (MD) simulation serves as a powerful computational approach for exploring atomistic behavior and estimating transport properties with improved resolution. In the present study, Equilibrium Molecular Dynamics (EMD) simulations are being carried out to evaluate the viscosity of 1,1,1,2-tetrafluoroethane (R134a), a commonly used hydrofluorocarbon (HFC) refrigerant as a reference working fluid. The simulations are performed using the Large-scale Atomic/Molecular Massively Parallel Simulator (LAMMPS). An OPLS-based force field is being applied to model the R134a system, and the simulation outputs are being compared with available experimental data from the literature to assess the accuracy of the model. The system is equilibrated under NVT (constant number of particles, volume, temperature) and NVE (constant number of particles, volume, energy) ensembles, and the viscosity is estimated using the Green–Kubo formalism through time integration of the autocorrelation function of the off-diagonal components of the microscopic pressure tensor.

Further refinement and comparison with experimental datasets are ongoing to improve model consistency. This work aims to establish a reliable molecular dynamics framework for predicting the viscosity of R134a, contributing to the development and evaluation of next-generation refrigerants and working fluids.

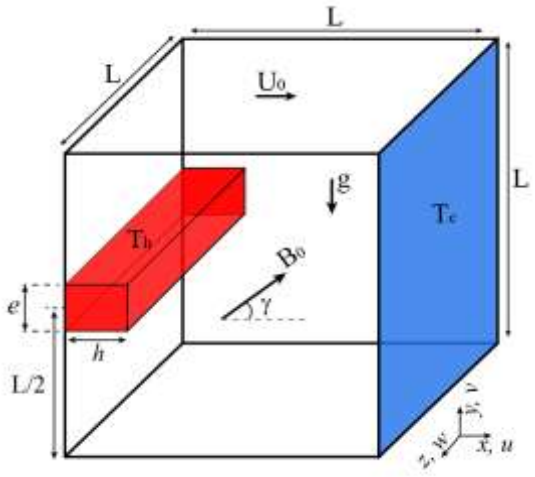
Mayur M. Maske
Guide, Department of Civil Engineering, K. E. Society's Rajarambapu Institute of Technology, Rajaramnagar

ABSTRACT



Civil engineering is developing rapidly as new technologies continue to shape the way structures are designed and built. One of the most exciting innovations is 3D concrete printing, which is gradually changing how construction is approached. This technology helps solve several challenges of traditional building methods, such as high labour costs, the time taken for formwork, material wastage, and safety issues on-site. It also plays an important role in reducing the environmental footprint by minimizing greenhouse gas emissions and optimizing material usage. With 3D printing, designers can create detailed and complex architectural forms that were once difficult or expensive to produce. Alongside this, digital tools like Building Information Modelling (BIM) are improving how projects are planned and managed, allowing for better coordination and accuracy. New cementitious materials and automated systems are also making printed structures stronger and more adaptable. In this review paper, the aim is to explore and analyse the existing literature available on 3D concrete printing. The focus is on understanding how this technology is used in modern construction, the ways to identify and manage printing defects, and the economic as well as environmental benefits that make 3D printing a promising method for future infrastructure development.

ABSTRACT
This work presents a numerical investigation of mixed magneto-hydrodynamic convection in a driven-wall cubic enclosure filled with a Cu–Al_2O_3/water hybrid nanofluid. An isothermal heating block at temperature T_h is attached to the left boundary, whereas the opposite wall is kept at a lower temperature T_c. A uniform magnetic field is imposed across the computational domain. The governing transport equations are resolved using the finite-volume approach combined with the SIMPLE scheme to ensure pressure–velocity coupling. The study examines the influence of key dimensionless parameters, namely the Richardson number (0.01–10), the Hartmann number (0–100), and the nanoparticle volume fraction (0-0.06). Flow structures and thermal fields are analyzed through streamlines, temperature contours, velocity distributions, and mean Nusselt numbers. Results show that higher Richardson numbers and particle concentrations improve heat transfer, whereas increasing the Hartmann number reduces the system's thermal efficiency.

A HYBRID CATBOOST-BASED SPATIOTEMPORAL FUSION MODEL FOR ACCURATE DAILY LAND SURFACE TEMPERATURE ESTIMATION ACROSS AFRICAN CLIMATE ZONES

ABSTRACT
Accurate estimation of daily Land Surface Temperature (LST) at high spatial resolution is essential for environmental monitoring, precision agriculture, and climate assessment, particularly in regions with limited ground-based observations such as the African continent. This study proposes a hybrid spatiotemporal fusion framework based on the CatBoost model to integrate the high temporal frequency of MODIS data with the fine spatial resolution of Landsat imagery. In addition to LST observations, the model incorporates meaningful explanatory variables including surface albedo, surface radiation and selected spectral indices to enhance predictive performance. The framework was evaluated across different climate zones in Africa, achieving an R^2 of 0.89 and an RMSE of 3.41°C for daily LST estimation. The results demonstrate the robustness and transferability of the proposed approach over heterogeneous regions, highlighting its potential for large-scale applications in environmental monitoring, drought detection and precision irrigation.

ABSTRACT
Dhaka's rapid urbanization, extensive groundwater extraction, and declining natural recharge, groundwater depletion a major concern. Since no observation-well data were available, the primary sources of information used in this study were google earth engine (gee) and satellite-based datasets. The gldas model generated the land-surface components of soil moisture, canopy water, and surface water, which were further processed for the groundwater storage anomalies (gwsa) extraction, while the gravity recovery and climate experiment (grace) solutions supplied the monthly anomalies of terrestrial water storage (twsa) used in the study. Additionally, the hydroclimatic effects on groundwater dynamics were examined using rainfall, evapotranspiration, and temperature datasets from chirps, mod16, and era5.in the dataset created using the grace-gldas integration approach for the years 1994 to 2024, anomalies in groundwater storage were found across the whole year. Such data helps in tracking trends of progressive groundwater storage depletion over time as well as seasonal variations. The nature of the climate–groundwater interactions was revealed in the gee environment by time-series decomposition, trend analysis using linear regression, and correlation studies. The results showed that groundwater storage has been steadily decreasing, with the worst depletion happening in the months preceding the monsoon season, when water demand is at its peak. The geographical distribution of groundwater stress was depicted on the spatial trend maps, and it was most prevalent in dhaka's densely inhabited and heavily urbanized districts. This study shows a repeatable and data-independent method for tracking groundwater changes in areas with few field observations by using just cloud-based earth observation instruments. The results show the significance of satellite-based monitoring for sustainable groundwater governance in quickly expanding urban contexts and promote proactive water management measures.

AN APPLICATION OF MIXED-INTEGER LINEAR PROGRAMMING TO MINIMIZE THE COST OF UNIVERSITY STUDENTS REQUIRED BASIC NUTRITIONAL REQUIREMENTS

Palash Kumar Das

Department ofMathematics, Hajee Mohammad Danesh Science and Technology University, Dinajpur, Bangladesh Place of work Dormitory 2(D-2) Hall ,(HSTU)

ABSTRACT

This study analyzes the effectiveness of linear programming (LP) methods in minimizing costs within budgets for student nutrition planning and small-scale agribusiness food formulation. In both cases, decision-making within limited resources while maintaining nutritional value is a challenge, where conventional empirical methods are not optimized. In the education-related field, a mathematical model is proposed for residential students, which helps meet nutritional needs at the lowest cost through daily food selection. According to the results, it is possible to implement a balanced diet plan for only 80 taka per day. In the agriculture-based field, since 70% of the production cost of small-scale farm food formulation is related to food, an optimization model is developed using local ingredients. It incorporates information on nutritional value, market prices, and industry practices. The model significantly reduces costs compared to conventional methods and provides insights into realistic decision-making through sensitivity analysis. The two models presented together show that LP-based optimization methods can play a significant role in cost-efficiency and effective use of resources.

Keywords: Nutrition planning; Linear programming (LP) methods; The agriculture-based field; Small-scale farm food formulation; LP-based optimization.

ABSTRACT

Accurate prediction of artillery trajectories has long depended on models that balance physical realism with computational simplicity. Traditional field methods relied on idealized equations or empirical firing tables, which often overlook the influence of aerodynamic drag and wind. The aim of this study is to reassess short-range projectile motion using modern physics while keeping the calculations accessible for manual or low-resource conditions. The work initiates three models of increasing fidelity on an ideal vacuum trajectory, a linear-drag formulation, and a full quadratic-drag model analyzed by a fourth-order Runge–Kutta scheme. Projectile specifications used in the simulations correspond to a 5 kg, 0.11 m diameter spherical iron shot with a drag coefficient of 0.47 and air density of 1.17 kg/m³ at 500 m altitude. Comparisons across models show how drag alters flight time, required muzzle velocity, and the presence of dual-angle firing solutions. For a 1,200 m target, the quadratic-drag model predicts feasible muzzle velocities ranging from roughly 143–156 m/s depending on angle, revealing substantial deviations from ideal estimates.The study also proposes a practical wind-correction method that uses an effective horizontal speed to adjust muzzle velocity under moderate headwind or tailwind conditions. This approach yields algebraic corrections that can be applied without computational tools and remains accurate within the tested range. The results indicate that simplified models are sufficient for conceptual understanding, but quadratic drag is necessary for realistic range prediction at typical artillery speeds. The main constraints arise from assuming constant drag coefficient, constant air density, no projectile spin, and equal launch-impact elevations. These restrictions limit applicability at long range, high altitude, or in transonic regimes, though the framework can be adapted for future refinement.

INTERPRETABLE MACHINE LEARNING FRAMEWORK USING XGBOOST, CATBOOST, AND SHAP FOR PREDICTING YARN TENSILE STRENGTH

Shahidul Islam
Affiliation: Barishal Textile Engineering College, Faculty of Textile Engineering, Department of Apparel Engineering, Barishal, Bangladesh
Email: Shahidul.islam.scholar@gmail.com
ORCID: 0009-0009-9468-6712

ABSTRACT

Yarn tensile strength is a key quality indicator in textile manufacturing. It affects the performance, durability, and reliability of the final product. Traditional methods for testing yarn strength, such as laboratory tensile testing, are accurate but can be slow, costly, and not suitable for real-time monitoring in factories. This limitation creates the need for quick, accurate, and understandable predictive methods that can help improve processes and ensure quality. This study presents a machine learning framework to predict yarn tensile strength using ensemble models XGBoost and CatBoost. taking into account features such as fiber characteristics (length, fineness, and maturity), process parameters (spinning speed, twist, and tension), and environmental factors (temperature and humidity). To make the model's outputs clear and useful, it includes SHapley Additive exPlanations (SHAP), which provide scores for feature importance and show how each factor affects the predicted yarn strength. This helps engineers identify key factors that impact yarn quality and make informed adjustments in real time. Experimental results show that the proposed models achieve better prediction accuracy than traditional regression and simple neural network methods while remaining transparent in decision-making. Feature analysis with SHAP reveals that fiber fineness and twist level are the most significant factors affecting tensile performance, offering practical insights to optimize production. By combining prediction capabilities with understandability, this framework promotes efficient monitoring, reduces material waste, and encourages data-driven choices in textile manufacturing. In general, the study shows that interpretable machine learning models can connect high-accuracy prediction with practical insights, supporting smarter, more sustainable, and quality-centered textile production practices.

ABSTRACT
As the world transitions toward cleaner and more sustainable energy systems, Small Modular Reactors (SMRs) are emerging as a promising nuclear energy solution, offering enhanced safety, operational flexibility, and improved efficiency. This study presents a neutronic analysis of a NuScale-type SMR core using the Monte Carlo simulation code OpenMC. A detailed three-dimensional model of the reactor core has been developed to perform reference calculations, including the evaluation of the effective multiplication factor (k_{eff}) and neutron flux distribution under nominal operating conditions. Additionally, a preliminary fuel depletion (burnup) study is conducted using OpenMC's depletion module to assess the evolution of the reactor's neutronic behavior over time. These simulations aim to track changes in fuel composition and their impact on core performance throughout the irradiation cycle. The initial results will be compared with available benchmark data to evaluate the accuracy and reliability of the developed model. This comparison contributes to the validation of OpenMC for advanced reactor physics studies and reinforces its credibility for neutronic simulations of industrial-scale SMR concepts.

ABSTRACT

Activated carbon was successfully produced from bamboo, an abundant and low-cost lignocellulosic resource found in Morocco and across various African regions, via a physico-chemical activation process involving potassium hydroxide (KOH) and carbon dioxide (CO_2) at 850 °C for 2 hours. The synthesized adsorbent was tested for its capacity to remove methylene blue (MB) dye from aqueous media at 30 °C. Equilibrium adsorption behavior was best described by the Langmuir isotherm model, revealing a maximum monolayer adsorption capacity of 454.2 mg/g, indicative of uniform surface adsorption. Kinetic studies employing both pseudo-first-order and pseudo-second-order models showed that the latter provided a superior fit to the experimental data, implying that the dye uptake mechanism is primarily chemisorptive in nature. The kinetic constants were also calculated to gain deeper insight into the adsorption dynamics. Overall, the results underline the promise of bamboo-based activated carbon as a high-performance and sustainable material for the treatment of dye-laden wastewater.

MULTIFUNCTIONAL Cu, B CO-DOPED ZnO PHOTOCATALYST: ORGANIC POLLUTANT DEGRADATION AND ANTIMICROBIAL COATINGS

Md Tanvir Anjum
E-mail: tanjum9001@gmail.com
Department of Applied Chemistry and Chemical Engineering, University of Dhaka.

ABSTRACT

This study broadly discusses the synthesis, characterization, and application of Cu- and B-codoped ZnO photocatalysts for the photocatalytic degradation of organic pollutants and their antimicrobial and pathogen inactivation properties. This study employed the sol-gel method for the efficient synthesis of photocatalysts. The photocatalyst was evaluated against cationic dyes, most prominently malachite green, which gives more than 90% degradation efficiency under UV-Vis light irradiation. Which shows its strong photocatalytic potential. Prior to wastewater treatment, this material's antimicrobial property was also evaluated against Escherichia coli and Staphylococcus aureus. This investigation demonstrates strong pathogen deactivation effects against E. coli and S. aureus. The result of this investigation suggests its sustainability for antimicrobial coating. This diversified photocatalyst suggests a multifunctional and sustainable approach towards environmental remediation by both organic pollutant degradation and microbial control. Thus supporting environmental sustainability and green earth preservation. Cu and B-codoped ZnO's improved photocatalytic performance is attributed to the dopants' synergistic effects on charge separation and visible light absorption. This modification elevated the degradation efficiency of the organic pollutants found in the industrial wastewater as well as broadened the application under solar light irradiation. This modification makes it a cost-effective and sustainable solution. My future investigation will be focusing on improving the photocatalytic activity by varying the dopant composition and expanding microbial testing, including a wide range of pathogens. The aim of this project is to develop a multifunctional coating and water purification system in order to support the global efforts to protect water resources and promote environmental sustainability.

Keywords: Photocatalysts, pollutants, UV-Vis irradiation, pathogen, antimicrobial property, green environment.

ABSTRACT
The implications of climate change are now clearly indicated by an increase in the frequency of cyclones, abnormal rainfall distribution, drought conditions, and increasing temperatures. Climate change has a significant influence on agricultural production, making it difficult to ensure food security as the population expands. Seaweed-based bio-stimulants have become a viable and efficient way to manage crop and soil stress and increase agricultural resilience against abiotic threats. Diverse bio-stimulatory effects of seaweed extracts are clearly evident, such as enhanced plant growth, nutrient uptake, and increased resistance to environmental challenges, including drought, salt, and abnormal temperature. It has been demonstrated that seed weeds have relatively low carbon footprints. Additionally, seaweed extracts enhance the plant-water relations, photosynthetic efficiency, stomatal function, and nutrient uptake. By strengthening the natural defence system of plants, seaweed extracts lessen the negative impacts of drought, such as decreased photosynthetic rates, cell membrane damage, osmotic imbalance, and increased oxidative stress. In this chapter, an attempt has been made to review the effect of seaweed and its biostimulatory properties on stress management in crop and soil health, especially abiotic stress management, highlighting advantages, limitations and potential developments.

ABSTRACT

Background: Patient satisfaction is a crucial measure of healthcare quality, influencing both health outcomes and care experiences. This study aims to identify the factors influencing patient satisfaction in healthcare facilities using machine learning algorithms due to their strong predictive capabilities. Methods: A cross-sectional survey was conducted with 312 patients from two private hospitals in Rangpur, Bangladesh. Machine learning models, including LightGBM, Random Forest, XGBoost, and CatBoost, were used to predict patient satisfaction, and SHAP value analysis was employed for interpretation. Results: The LightGBM classifier (before SMOTE) outperforms other models across metrics, with the highest accuracy, MCC, and ROC-AUC scores, establishing it as the optimal predictive model for this study. SHAP analysis further reveals that factors such as treatment plan, age, appointment ease, waiting time, and medication details significantly influence satisfaction levels. Overall, results indicate that structured interactions, shorter waiting times, and clear communication are associated with higher satisfaction, while extended waiting times and lack of decision involvement negatively impact patient experiences. Conclusion: To enhance patient satisfaction, healthcare providers should prioritize improving communication, reducing wait times, and offering clear treatment plans. Future research should explore additional factors to refine predictive models. The LightGBM classifier provides valuable insights into the key determinants of patient satisfaction, enabling healthcare practitioners and researchers to utilize it for targeted prediction and analysis in their specific contexts.

ABSTRACT

Large-scale, integrated analysis of intricate molecular systems has been made possible by bioinformatics and omics technologies, which have transformed biological research. High-throughput omics techniques, such as transcriptomics, proteomics, metabolomics, and genomics, when combined with sophisticated bioinformatics tools, enable thorough investigation of biological processes at several levels. This integration advances functional genomics and precision medicine by accelerating the identification of regulatory pathways, gene-disease associations, and disease biomarkers. Researchers can use computer algorithms, machine learning models, and predictive analytics to extract important biological insights from massive datasets generated by omics platforms. Furthermore, the interpretation of intricate relationships between genes, proteins, and metabolites is supported by cutting-edge techniques for data visualization and network analysis. Although there has been significant development, there are still issues with data standards, interoperability, and the integration of multi-omics data to improve biological validity and clinical relevance. These issues are being addressed by ongoing advancements in artificial intelligence, cloud computing, and big data frameworks, opening the door for systemic biology modeling and tailored treatment approaches. In the end, the fusion of omics and bioinformatics continues to advance biomedical science by providing a better comprehension of health, disease causes, and possible treatment approaches.

Keywords: bioinformatics, omics, multi-omics integration.

ABSTRACT
Gaskets are a group of design solutions used to seal the surfaces of components that remain stationary relative to each other. The tightness level of a given fitting element, such as a flange-bolted joint, depends on the quality of the sealing and mating surfaces (determined by parameters such as microstructure, waviness, or hardness). This paper proposes a novel approach to shaping the sealing surface microstructure, aimed at inducing flow effects that lead to increased flow resistance of the sealed medium and improved tightness. The tightness characteristics were experimentally determined for two gasket variants: a structured gasket and a quasi-smooth gasket, which was adopted as the reference. Experimental results indicated that structured gaskets achieve a significantly lower leakage rate compared to quasi-smooth gaskets. This increase in tightness is particularly evident at relatively low values of the compressive force applied to the gasket. To identify the flow phenomena occurring at the interface between the sealing and mating surfaces, a preliminary, simplified numerical CFD model was developed. The study demonstrated the potential to improve tightness by inducing a fluid flow circulation effect. Finally, directions for further research on the presented concept are outlined, with particular emphasis on the limitations and challenges associated with the development of the numerical CFD model.

ABSTRACT
Alçak basınçlı döküm (LPDC) prosesinde kullanılan kalıp bileşenleri, ürün geometrisinin doğruluğunu, yüzey kalitesini ve üretim kararlılığını doğrudan etkileyen kritik elemanlardır. Kalıplar üretim sırasında yüksek sıcaklıktaki sıvı alüminyumla tekrarlı şekilde temas ettiğinden yoğun termal yük altında çalışır ve bu durum tasarım değişiklikleri, tadilatlar ve bakım uygulamalarının doğru yönetilmesini gerekli kılar. Bu bağlamda kaynak işlemleri, kalıp ömrünü uzatan ancak doğru uygulanmadığında hasara neden olabilen önemli bir bakım adımıdır. Kalıplarda sıklıkla gözlenen hasarlardan biri termal yorulmadır. Literatürde termal yorulma; sıcaklık değişimleri, yüzeydeki sıcaklık gradyanları ve kısıtlı termal şekil değiştirmeler altında oluşan tekrarlı termal gerilmeler sonucu makroskobik çatlakların meydana geldiği bir yorulma türü olarak tanımlanmaktadır. Bu çatlaklar özellikle keskin geçişler, maça birleşimleri ve ısı yoğunlaşmasının arttığı bölgelerde hızla ilerleyerek kalıp performansını olumsuz etkiler. Bu çalışma, yeni üretilmiş bir kalıpta tasarım değişikliği sonrası alt maça bölgesinde gerçekleşen kaynak uygulaması sırasında ortaya çıkan termal yorulma çatlağını ele almaktadır. Çatlağın konumu nedeniyle standart kaynak prosedürleri yetersiz kalmış ve bu bölgeye özel optimize edilmiş bir prosedür geliştirilmiştir. Uygulamada kontrollü ön ısıtma, uygun dolgu malzemesi seçimi ve gerilim giderme ısıl işlemi birlikte kullanılmıştır. Kaynak sonrası kalıp işlenerek üretime alınmış ve seri üretim boyunca düzenli olarak izlenmiştir. Yapılan kontroller, çatlak ilerlemesinin durduğunu ve yapısal bir bozulma oluşmadığını göstermiştir. Sonuçlar, optimize edilmiş kaynak prosedürünün kalıp dayanımını artırdığını, bakım sıklığını azalttığını ve tadilat maliyetleri üzerinde olumlu etkiler sağladığını göstermektedir.

PREVENTION OF THERMAL FATIGUE CRACKS AND EXTENDING MOLD LIFETIME THROUGH IMPROVED WELDING PROCEDURES

ABSTRACT

Components of molds used in the low-pressure die casting (LPDC) process are critical elements that directly influence dimensional accuracy, surface quality, and production stability. Since molds repeatedly come into contact with high-temperature molten aluminum during production, they operate under severe thermal loads, making proper management of design changes, repairs, and maintenance practices essential. In this context, welding operations represent a significant maintenance step that can extend mold life but may also cause damage if not applied correctly. One of the most frequently observed failures in molds is thermal fatigue. In the literature, thermal fatigue is defined as a fatigue mechanism in which macroscopic cracks occur due to cyclic thermal stresses arising from temperature fluctuations, surface temperature gradients, and constrained thermal deformation. These cracks particularly propagate rapidly in areas such as sharp transitions, core joints, and regions with increased heat concentration, ultimately reducing mold performance. This study addresses a thermal fatigue crack that emerged in the lower core region of a newly manufactured mold following a design modification and subsequent welding operation. Due to the crack's location, standard welding procedures were insufficient, and a customized, optimized procedure was developed specifically for this area. The procedure employed controlled preheating, appropriate filler material selection, and stress-relief heat treatment in combination. After welding, the mold was machined and introduced into production, where it was monitored regularly throughout serial manufacturing. Inspections revealed that crack propagation had stopped and no structural deterioration occurred. The results demonstrate that the optimized welding procedure enhanced mold durability, reduced maintenance frequency, and positively influenced repair costs.

ABSTRACT

Geçmişte ahşap malzemeden üretilen jantlardan, günümüzde alüminyum alaşımlı veya kompozit yapılı jantlara doğru bir evrim süreci yaşanmıştır. Bu süreçte birçok üretim yöntemi geliştirilmiş ve uygulanmış olup, bu yöntemler üzerine çalışmalar hâlen devam etmektedir. Günümüzde ise otomotivlerde kullanılan jantların büyük çoğunluğu alüminyum alaşımlı olup, alçak basınçlı döküm yöntemiyle üretilmektedir. Dökümde kullanılan kalıpların işlenmesi ve genel talaşlı imalat yöntemleriyle ilgili birçok akademik ve sektörel çalışma mevcuttur. Bu çalışmada, CNC tezgâhlarda kullanılan post processor yazılımlarına entegre edilen yeni nesil iyileştirme çalışmalarına yönelik optimizasyonlar detaylı şekilde ele alınmıştır. Özellikle kalıp üretim süreçlerinde karşılaşılan verimlilik kayıpları, iş güvenliği riskleri ve operasyonel müdahale gereklilikleri, yapılan geliştirmeler sayesinde büyük ölçüde minimize edilmiştir. Yapılan iyileştirmeler kapsamında, CNC tezgâhlara ölçüm probu entegre edilerek takım uçlarında meydana gelen aşınma, kırılma veya tolerans dışı sapmaların otomatik olarak algılanması sağlanmıştır. Post processor yazılımı, işleme sırasında belirli periyotlarla takımı ölçüm pozisyonuna yönlendirmekte; takımın ölçümleri referans değerlerle karşılaştırılarak tolerans dışına çıkıldığında ofset değerleri otomatik işlem durdurularak operatör uyarılmaktadır. Bu sistem sayesinde, manuel kontrol ihtiyacı ortadan kaldırılmış, hem iş güvenliği hem de ürün kalitesi önemli oranda artırılmıştır. Geliştirilen post processor iyileştirmeleri yalnızca belirli bir CNC tezgâh markası ile sınırlı kalmayıp, farklı marka, model ve kontrol ünitesine sahip tezgâhlara uyumlu hale getirilmiştir. Bu kapsamda, makine tanıma algoritmaları sayesinde her bir tezgâhın spindle devri, ilerleme hızı, takım yolu formatı gibi parametreleri otomatik olarak belirlenmekte ve üretim başlamadan önce sistem tarafından optimize edilmektedir. Böylelikle operatör müdahalesine ihtiyaç duyulmadan, farklı tezgâhlar için özel işlem kodları üretilmekte ve çapraz uyumluluk sağlanmaktadır.

Anahtar Kelimeler: CNC tezgâhları, Post-processor optimizasyonu, Prob entegrasyonu, Güç kesintisi algılama

IMPROVING PRODUCTION EFFICIENCY THROUGH POST-PROCESSOR ENHANCEMENTS AND PROBE INTEGRATION IN CNC MACHINES

ABSTRACT

A transition has occurred from wheel rims produced from wooden materials in the past to today's aluminum alloy or composite structures. Throughout this evolution, numerous manufacturing methods have been developed and implemented, and studies on these processes continue. Currently, the majority of wheels used in the automotive industry are made of aluminum alloys and are produced using the low-pressure die casting method. There are many academic and industrial studies related to machining of casting molds and general subtractive manufacturing methods. In this study, optimization improvements carried out for next-generation enhancements integrated into post-processor software used in CNC machines are examined in detail. Productivity losses, occupational safety risks, and operational intervention requirements frequently encountered in mold manufacturing processes have been significantly minimized through the developments implemented. Within the scope of these improvements, a measurement probe was integrated into CNC machines, enabling automatic detection of tool wear, breakage, or out-of-tolerance deviations. During machining, the post-processor software directs the tool to the measurement position at specific intervals; tool measurements are compared with reference values, and when deviations exceed tolerance limits, the system automatically stops the operation and alerts the operator by updating the offset values. Through this system, the need for manual inspection has been eliminated, substantially enhancing both occupational safety and product quality. The developed post-processor enhancements are not limited to a specific CNC machine brand; instead, they have been adapted to machines of different brands, models, and control units. In this context, machine recognition algorithms automatically identify parameters such as spindle speed, feed rate, and toolpath format for each machine, and the system optimizes these parameters before production begins. Thus, without requiring operator intervention, customized machining codes are generated for different machines, ensuring cross-compatibility across the production line.

ABSTRACT

İmalat parametrelerinin optimizasyonu ile üretim zamanlarının kısaltılması geçmişten günümüze önemli bir araştırma alanı olmuştur. Seri imalat yapan endüstriler için imalat zamanlarında saniyelerin bile önemli olduğu düşünülmektedir. Seri imalatta kalıplar ve kalıp bileşenleri kullanılmaktadır. AISI H13 takım çeliği ısıl işlemle ayarlanabilen özellikleri nedeniyle kalıp bileşenlerinin yenilenmesi ve tamirinde tercih edilmektedir. Kaynaklı imalatla yenilenen kalıp bileşenleri ancak işleme ve tesviye gibi imalat işlemleri sonrasında üretim hattına alınabilmektedir. Dolayısıyla, üretimin sürdürülebilirliği açısından kaynak, işleme ve tesviye sürelerinin araştırılması gereklidir. Ayrıca farklı dolgu telleri ile yapılan kaynak, farklı kaynak metali sertlik değerlerine neden olmakta ve sertlik artışı nedeniyle imalat süreleri uzayabilmektedir. Bu araştırmada, çelik numuneler 3 farklı dolgu teli kullanılarak birleştirilmiş, zımparalama ve parlatma işlemleri sonrasında Ana Metal, ITAB ve Kaynak Metalinin mikro sertlik ölçümleri yapılmıştır. Maksimum sertlik değeri Dolgu Teli 2'de 623 Vickers olarak kaynağın Isı Tesiri Altında Kalan Bölgesinde (ITAB) ölçülmüştür. Minimum sertlik değeri ise Dolgu Teli 3'te 249 Vickers olarak Kaynak Metalinde görülmüştür. Dolgu teli 1'de bu değerlerin arasında sertlik değerleri gözlenmiştir. Farklı dolgu telleri kullanılarak yenilenen AISI H13 takım çeliği kalıpların, kaynaklı imalat, işleme ve tesviye zamanları her tel için ölçülmüş ve mikro sertlik değerlerinin etkisi araştırılmıştır.

Anahtar Kelimeler: AISI H13 takım çeliği, imalat zamanı, mikro sertlik

AN INVESTIGATION ON MICRO HARDNESS and PRODUCTION TIMES OF AISI H13 TOOL STEEL WELDING WITH DIFFERENT FILLER WIRES

ABSTRACT

Shortening the production time with optimising production parameters has been an important research field from past to today. Even seconds have been considered important in production time for industries which made serial production. Molds and mold parts have been used for serial production. AISI H13 steel is preferred for renovation and repair of mold parts due to its adjustable properties with heat treatment. Renovated mold parts can be taken to the production band after manufacturing processes such as machining and levelling. Thus, welding, machining and levelling times should be investigated for the sustainability of the production. Also, welding with different filler wires lead different weld metals which have different hardness values and production time can be increased due to high hardness values. In this study, steel specimens were welded with three different filler wires, micro hardness values were measured after grinding and polishing stages. Maximum hardness was measured as 623 Vickers at the Heat Affected Zone of FW2. Minimum hardness was seen as 249 Vickers in the Weld Metal of FW3. Moderate hardness values were observed for FW1. Welding, machining and levelling times were measured for AISI H13 tool steel molds which were renovated with using different filler wires and the effects of micro hardness values were investigated.

Keywords: AISI H13 tool steel, production time, micro hardness

ÖZET

Periyot, depreme dayanıklı yapı tasarımında ihtiyaç duyulan yapının önemli karakteristiklerindendir. Deprem mühendisliğinde temel bir parametre olan hâkim periyot, yapısal performansın öngörülmesi, tasarım spektrum eğrilerinin oluşturulması ve deprem etkisindeki mevcut yapıların durum değerlendirilmesi bakımından kritik bir rol üstlenmektedir. Bir binanın temel periyodu, yapının yüksekliği boyunca rijitlik ve kütlenin dağılımı ile ilişkilidir. Dolayısıyla deprem yükü etkisi altındaki binaların davranışı da, binaların rijitlik ve kütle özellikleri tarafından kontrol edilen yapının dinamik özelliklerine bağlı olmaktadır. Bu nedenle, bina periyodunun hesaplanmasıyla ilgili olarak yapılan çalışmalar literatürde önemli bir yer tutmaktadır. Bu çalışma da, binaların hakim periyodunun belirlenmesine yönelik literatürde yer alan analitik ve nümerik yöntemlerin kapsamlı bir değerlendirmesini sunmayı amaçlamaktadır. Bu çalışma kapsamında; ulusal ve uluslararası deprem yönetmeliklerinde sunulan ampirik periyot bağıntıları ile sayısal modal analiz yöntemleri karşılaştırmalı olarak değerlendirilmiş ve söz konusu yöntemler arasındaki uyum ile farklılıklar incelenmiştir. Ayrıca; kat sayısı, taşıyıcı sistem türü, malzeme özellikleri ve rijitlik dağılımı gibi bina özelliklerinin periyot değerleri üzerindeki etkileri tartışılmıştır. Çalışmadan elde edilen sonuçlar ile, hesaplama yöntemleri arasındaki farklılıkların sebepleri irdelenmekte ve tasarımcılar ile araştırmacıların uygun yöntem seçiminde yararlanabileceği kapsamlı çıkarımlar yapılarak öneriler sunulmaktadır.

Anahtar Kelimeler: Hakim periyot, Deprem, Dinamik karakteristik.

EVALUATION OF ANALYTICAL AND NUMERICAL APPROACHES IN ESTIMATING THE FUNDAMENTAL PERIOD OF BUILDINGS

ABSTRACT

The period is one of the important characteristics of a structure required in earthquake-resistant design. As a crucial parameter in earthquake engineering, the fundamental period plays a critical role in predicting structural performance, developing design spectrum curves, and assessing the existing structures under seismic effects. The fundamental period of a building is related to the distribution of stiffness and mass throughout the height of the structure. Therefore, the behavior of buildings under seismic loads depends on the dynamic characteristics of the structure, which are controlled by the stiffness and mass properties of the buildings. Consequently, studies related to the calculation of building periods are of significant importance in the existing literature. This study aims to provide a comprehensive evaluation of the analytical and numerical methods found in the literature for determining the fundamental period of buildings. Within the scope of this study, empirical period relationships presented in national and international earthquake codes were evaluated comparatively with analytical and numerical modal analysis methods, and the compatibility and differences between these methods were examined. Furthermore, the effects of building characteristics such as number of stories, type of structural system, material properties, and stiffness distribution on period values are discussed. The results obtained from the study examine the reasons for the differences between calculation methods and provide comprehensive conclusions and recommendations that designers and researchers can use to select the appropriate method.

Keywords: Fundamental period, Earthquake, Dynamic characteristic.

ÖZET
Günümüzde hızla artan nüfus, mevcut enerjinin talebe yetişememesine ve fosil kaynaklar gibi yenilenemeyen enerji kaynaklarının hızla tükenmesine neden olmaktadır. Bu durum yenilenebilir enerji kaynaklarının (RES) kullanımını kaçınılmaz hale getirmiştir. RES'teki süreksiz ve değişken durumun üstesinden gelmek için üretilen enerjinin depolanması (ES) gerekmektedir. Bu, sistemlerin sürekli bir şekilde üretimlerine devam etmelerini sağlanmaktadır. Enerjinin sürdürülebilir şekilde kullanılması için üretimi kadar depolanması da çok önemlidir. Bu amaçla, gizli ısı depolama (LHS) yönteminde kullanılan faz-değişim-malzemeleri (PCMs), enerji depolama yoğunluklarının yüksek olması ile son yıllarda öne çıkmaktadırlar. Parafin, yüksek gizli ısı, geniş erime sıcaklığı, ekonomik olması, toksik olmaması ve kolay temin edilebilirlik gibi özellikleri ile bilinmektedir. PCM'ler içerisinde en çok tercih edilen organik-tabanlı bir malzemedir. Parafinin farklı erime sıcaklık aralıklarına sahip çeşitleri bulunmaktadır. Bu özellikleri ile elektronik cihazların termal yönetiminde, binaların ısı yönetiminde, sıcak su depolamada, gıda taşımada, güneş enerjili sistemler gibi farklı ES uygulamalarında tercih edilmektedir. Fakat, parafinin düşük ısıl iletkenliği, yüksek sızıntı oranları, düşük şekil stabilitesi, yüksek hacim değişimi gibi dezavantajları bulunmaktadır. Bu dezavantajların üstesinden gelebilmek için parafin FDM'sine karbon, seramik, metal- ve metal oksit-bazlı-nanomalzemeler ilave edilmektedir. Grafit ve grafen gibi karbon-bazlı-nanomalzemeler, düşük katkı oranlarında bile FDM'nin termal iletkenliğini, şarj ve deşarj hızını arttırmaktadırlar. Bor nitrür (BN) ve alümina (Al_2O_3) gibi seramik-bazlı-nanomalzemeler, FDM'nin termal ve kimyasal kararlılıklarını arttırarak uzun çevrimlerde ömürlerini uzatır. Ayrıca elektriksel yalıtkanlıklarının da artmasını sağlar. Bakır (Cu), alüminyum (Al), titanyum oksit (TiO_2) ve demir oksit (Fe_2O_3) gibi metal ve metal oksit-bazlı-nanomalzemeler ise çekirdeklenme merkezleri oluşturarak FDM'nin aşırı soğumasını azaltmaktadırlar. Uygun katkı oranı kullanılmadığında nanomalzemeler FDM içerisinde homojen olarak dağılamaz ve faz ayrışması meydana gelir. Ayrıca LHS kapasitesinde de düşmelere neden olur. Bu kapsamda, nanomalzemelerin ED uygulamasına göre seçilmesi sistemin verimliliğinin artmasını sağlayacaktır.

ENHANCING OF PARAFFIN-BASED PHASE CHANGE MATERIALS WITH NEXT-GENERATION NANOMATERIALS

ABSTRACT

The swiftly growing world population has resulted in an energy supply that can no longer satisfy rising demand, leading nonrenewable resources such as fossil fuels to deplete quickly. This has made the transition to renewable energy sources (RES) inevitable. To overcome the discontinuous and variable situation in RES, the produced energy needs to be stored. Energy-storage (ES) allows systems to run constantly while sustaining a balance between supply and demand. To this end, Phase-Change-Materials (PCMs), exploited in latent-heat-storage (LHS) systems, have gathered substantial attention in recent years due to their high ES density. Paraffin wax stands out as a widely used organic PCM, recognized for its high latent heat of fusion, broad melting point range, cost-effectiveness, non-toxicity, and commercial availability. With various grades exhibiting distinct phase-transition-temperatures, paraffin is utilized in diverse thermal management applications, including electronics cooling, building climate control, domestic hot water storage, perishable food transport, and solar thermal systems. Nevertheless, paraffin's adoption is restrained by inherent limitations such as low thermal conductivity, a pronounced tendency to leak in the liquid phase, poor shape stability, and significant volume change during phase transition. To mitigate these issues, nanomaterials—including carbon, ceramic, metal, and metal oxide variants—are introduced into the paraffin matrix. Carbon-based-nanomaterials like graphite and graphene significantly ameliorate the composite's thermal conductivity and charge-discharge rates, even at low loadings. Similarly, ceramic-based-nanomaterials such as boron-nitride (BN) and alumina (Al_2O_3) enrich thermal and chemical stability, thereby extending the PCM's service life over numerous cycles and improving its electrical insulation. In contrast, metal and metal oxide-based-nanomaterials (e.g., Cu, Al, TiO_2, Fe_2O_3) function primarily as nucleation agents, decreasing the degree-of-supercooling. Suboptimal loadings can lead to agglomeration and phase-separation, which degrades the LHS capacity. Therefore, the strategic selection of nanomaterials, tailored to the specific application, is vital for maximizing overall system performance.

ABSTRACT
The concept of civilization is a constantly evolving phenomenon, evolving as people adapt and improve their lifestyles and standards as they meet their own needs. Civil engineering is at the core of civilization because it is the engineering concept that provides the first step towards the continual development and transformation of shelter, the primary need for humankind, and also the first step towards uniting people and meeting other needs. Structures that have endured for centuries have always been maintained without major structural modifications to preserve the culture they reflect. In today's world, FRP materials are extensively used to strengthen structures. Thanks to the diverse contributions FRP materials offer in every geometry, they offer strengthening methods for all structural systems manufactured with past and present technologies. FRP fabrics, pipes, rods, profiles, and ropes all offer benefits in specific mechanical systems. FRP composite systems achieve their compositeness through the proper combination of fiber and epoxy materials. With a wide range of composite materials, it is crucial to achieve the theoretical strength and strengthening effect through proper application. Changes in the mechanical strength of FRP materials are also observed by adding nanographene to epoxy. This paper presents a study on the fracture and rupture mechanisms of composite rope elements produced using both conventional methods and those containing nanographene platelets, subjected to compression, tension, and bending tests, and on the production methods and impregnation status of the matrix material.

ABSTRACT

The porous silicon (PS) structure required for the fabrication of the device designed as an acetone vapor detector was formed on the n type crystalline silicon surface by electrochemical anodization with a HF-based electrolyte at constant time and current density. Ag paste was also applied to the surfaces of the GS/nSi structures under room conditions. The acetone vapor sensitivities of the Ag/GS/nSi structures were investigated with 50-250 ppm N_2 carrier gas over time. The junctions, which exhibit Schottky diode properties, produced a short-circuit current in acetone vapor without requiring an external power supply and exhibited gas sensor behavior. In our study, where the physical characterizations of the PS structure and the Ag paste/GS/nSi structure were performed, this structure, prepared under room conditions, was presented to the literature for the first time.

Keywords: Porous silicon, acetone, gas sensor

ABSTRACT

Since old times, mankind has continuously sought ways to protect itself from external threats. Depending on the type and severity of the attack, a wide variety of materials, including animal skin, copper, wood, and later steel have been used to construct protective armors. With the development of synthetic polymers in the 20th century, the field of personal and structural protection experienced a major transformation. Strong, lightweight fibers led to the rise of polymer-based composites and multilayer textile systems, which today form the backbone of modern ballistic protection, from body armor to vehicle panels and aircraft cockpit doors. In line with these technological advancements, this study investigates the ballistic impact behavior of soft, multilayer fabric armors through numerical simulation. The impact is modeled using a right circular cylindrical projectile. At the material level, the biaxial woven fabric is represented yarn-by-yarn using a discrete mass–spring–damper model with pin-joint connections. This approach allows the simulation to realistically capture how yarns interact, deform, and respond at high strain rates during impact. After the projectile strikes the fabric, the model tracks how the layers deform, how yarn velocities change over time, and how damage begins and spreads across the structure. These responses are visualized and analyzed using displacement fields, velocity histories, and strain contours generated throughout the simulation. To examine how material design influences performance, two fabric layers made from different fiber systems are combined in different stacking sequences. The ballistic effectiveness of each configuration is evaluated using key metrics such as back-face signature, residual projectile velocity and the pattern of damage.

Keywords: Composite body armors, ballistic impact, RCC, finite difference method.

A NOVEL TRIGONOMETRIC SHEAR DEFORMATION MODEL FOR PREDICTING THE THERMAL BUCKLING OF COMPOSITE STRUCTURES

ABSTRACT
In this paper, a novel trigonometric shear deformation theory to examine the thermal stability analysis of functionally graded plates is presented. In this theory the distribution of transverse shear deformation is parabolic across the thickness of the plate by satisfying the surface conditions. Therefore, it is unnecessary to use a shear correction factor. The principle virtual works is used herein to extract equilibrium equations. The analytical solution is determined using the Navier method for a simply supported rectangular plate. The precision of this theory is verified by comparing it with the various solutions available in the literature.
Keywords: Thermal buckling analysis; FGM plates; composites.

A REVIEW ON STANDARD DESIGN PARAMETERS FOR RAMMED EARTH WALL CONSTRUCTION

ABSTRACT

Rammed earth wall construction gained renewed attention in the modern world due to its low carbon footprint and sustainability in contrast to conventional masonry. It is prepared with compacted damp soil between temporary formworks. Although it is not a new invention and has been used for centuries, however in modern construction and wider practice a clear understanding and reliable guidelines of the standard parameters, including material properties, quality control, and the structural performance under different environmental and loading conditions are required. This research is a review on the findings of international standards and previous research work to highlight the essential parameters affecting the overall performance of rammed earth walls, including soil preparation, moisture levels, stabilizers, physical and mechanical properties. A natural rammed earth wall contains materials such as silt, clay, sand and gravel, among which the clay is considered as principal binder. The upper ranges of materials should be between 15-35% for clay, 30-80% for silt, and the mixture of sand and gravel varies between 20-80%. The proposed optimum moisture content of the mixture is about 10% that may have a density in the range of 2000-2300 kg/m^3. The recommended dosage of stabilizers, such as cement (OPC) ranging from 4-15%, and lime ranging between 6-12% of the soil mixture by dry weight. The minimum compressive strengths for sandy-gravel soil ranging between 2.7 to 6.9 MPa, silty soil between 2 to 6.2 MPa, and clayey soil ranges from 1.7 to 4.1 MPa. The rammed earth walls provide excellent thermal mass insulation properties for the house. The REW buildings should be designed as seismic resistant in earthquake-prone areas and having a monolithic dense subgrade or concrete for foundations. There is a minimum thickness requirement for interior and exterior walls in which for a one-storey building is 200 mm and 300 mm, while for a two-story building is 300 mm and 450 mm, respectively.

Keywords: Rammed earth, Design standards, Stabilizer, Mechanical properties, Thermal resistance, Seismic resistance.

IONIC-LIQUID GRAFTED $NIFE_2O_4$/G-C_3N_4 NNAOHYBRID FOR ULTRA-SENSITIVE AND SELECTIVE ELECTROCHEMICAL MELAMINE MONITORING

ABSTRACT

In this study, we developed a conducting paper-based electrochemical biosensor (CPE) using 1-Butyl-3-methylimidazolium chloride ([BMIM][Cl^-]) and 1-Allyl-3-methylimidazolium chloride ([AMIM][Cl^-]) ionic liquids modified nickel ferrite ($NiFe_2O_4$) and graphitic carbon nitride (g-C_3N_4) nanohybrid (ILs@rGO-MoS_2) for the highly sensitive non-enzymatic detection of melamine. The stabilised Whatman filter paper has been modified using ILs@rGO-MoS2 nanohybrid to develop ILs@g-C_3N_4/$NiFe_2O_4$/CP electrode. The structural and morphological (FTIR, Raman, XRD, and FESEM-EDAX) results confirmed the successful development of the ILs@g-C_3N_4/$NiFe_2O_4$ nanohybrid and its uniform fabrication onto the CPE. The chronoamperometric results of ILs@g-C_3N_4/$NiFe_2O_4$/CPE indicate that it exhibits high conductivity, sensitivity, and a larger active surface area, which facilitates highly selective detection of Phenolic pollutants. The developed biosensor exhibited a wide linear range of 40.0 to 0.01 µM, with a low limit of detection of 2.12 µM and the sensitivity were 1.1723 µA μM^{-1} cm^{-2} for the detection of melamine. These findings demonstrate that the ILs@g-C_3N_4/$NiFe_2O_4$/CPE-based biosensor provides a low-cost, flexible, and environmentally friendly platform with excellent potential for detecting melamine in real sample analysis.

Keywords: Ionic Liquids, $NiFe_3O_4$@g-C_3N_4 nanohybrid, Biosensors, Melamine.

UTILIZING LOW-COST EGGSHELL AND COCONUT MIXTURES AS EFFICIENT ADSORBENTS FOR REMOVING LEAD AND CHROMIUM FROM TANNERY EFFLUENT

ABSTRACT

This study evaluates the preparation, physicochemical properties, and heavy-metal adsorption performance of activated carbons produced from coconut shell and eggshell, and their composites, for treatment of tannery effluent. Activated carbons were produced by pyrolysis and chemical/steam activation, characterized by proximate analyses (moisture, ash, bulk density, pH), and applied at varying CS:ES ratios to 50 mL tannery wastewater samples under neutral conditions (pH 7) with 30 min contact times. Coconut-shell carbon (CS) exhibited the highest dual-metal removal, achieving up to 80.5% chromium and 85.5% lead removal, while eggshell carbon (ES) showed stronger Pb selectivity (up to 85.8% in certain composites). Composite adsorbents displayed synergistic and competitive behaviors: CS-rich blends favored Cr uptake, ES-rich blends enhanced Pb removal, and some mixed ratios produced improved Pb selectivity (e.g., sample F). Physicochemical data (ash 8.8–9.82%, bulk density ≈0.553–0.569 $g \cdot mL^{-1}$, moisture 6.2–8.7%, pH 7–7.5) indicate suitable handling and adsorption characteristics for aqueous treatment. The results demonstrate that low-cost, biomass-derived carbons and tailored composites offer effective, sustainable options for tannery wastewater remediation; the authors recommend regeneration studies, cost–benefit analyses, and pilot-scale trials to confirm field applicability.

ABSTRACT

Sustainable soil fertility management is vital for crop productivity in Bangladesh, particularly for smallholder farmers dependent on organic inputs. This study assessed the potential of composted water hyacinth (*Eichhornia crassipes*), an invasive aquatic weed, as an alternative to cowdung in cauliflower (*Brassica oleracea* var. botrytis subvar. cauliflora L.) cultivation under AEZ-14 (Gopalganj-Khulna Beels). A field trial was conducted using a randomized complete block design (RCBD) with four treatments: cowdung (5 t/ha), water hyacinth compost at 5, 8, and 11 t/ha. Agronomic parameters, yield, and soil nutrient dynamics were evaluated. Results revealed that water hyacinth compost at 11 t/ha significantly improved curd length (23.50 cm), diameter (50.13 cm), weight (534 g), and yield (22.25 t/ha) compared to cowdung (15.25 t/ha). Soil nutrient status post-harvest showed increased potassium and micronutrient availability, demonstrating water hyacinth's high nutrient content and its role in soil enrichment. The findings suggest water hyacinth compost is a cost-effective, eco-friendly alternative to conventional organic fertilizers, supporting sustainable crop production in nutrient-depleted soils.

ENHANCEMENT OF SAFETY AND ACCESSIBILITY IN THE DESIGN OF A PUBLIC TRANSPORTATION HUB FOR MINNA, NIGER STATE

ABSTRACT

Inadequate safety and accessibility at Minna's motor transport hubs reflect wider infrastructural gaps in Nigerian cities. Observations reveal disorganized layouts and decaying facilities: for example, one study found most motor parks in Minna in disrepair, leaving commuters highly dissatisfied. Critically, basic accessible design is absent – one analysis noted that 80% of Nigerian construction projects omit disability planning entirely, compounding everyday barriers for mobility-impaired users. Inclusive design theory emphasizes that wellplanned internal circulation and safety features are essential for all. Indeed, embedding universal design in transit facilities "allows everyone to enjoy spaces on equal terms" and makes travel safer and easier for users of all ages and abilities. For this study, a mixed-methods approach was employed, combining site surveys, stakeholder interviews, and observational audits to systematically map pedestrian and vehicular flows and user experiences at Minna's main transport hub. Findings reveal chaotic spatial organization (e.g. waiting areas encroaching on parking), missing accessible elements (no ramps or tactile pathways), and critical safety lapses (inadequate lighting, no surveillance). For instance, many commuters reported waiting in their vehicles under open sky due to absent sheltered lounges – a circumstance previously described as "unpleasant" in Minna parks. These operational deficiencies underscore the urgent need for comprehensive redesign of the hub. We propose a context-sensitive design framework to reconceive the hub as an inclusive civic space. The framework reorganizes the station into clearly defined zones (drop-off, boarding, waiting) with barrier-free circulation routes and enhanced wayfinding, coupled with robust safety infrastructure (ramps, tactile guides, welllit shelters, CCTV). By foregrounding universal design principles, it aligns with Nigeria's disability-rights commitments (e.g. UNCRPD ratification) and translates them into practical station design guidelines. The framework offers urban planners, policymakers and architects an actionable model for inclusive transport hub design, advancing equitable mobility and social inclusion in the Nigerian context.

ABSTRACT
Critically this paper examines, the increasing power of visual consumption in shaping the modern urban setting and its consequences of allegedly weakening the right to the city coined by Henri Lefebvre. The study investigates the modifications occur to perceptions of space, identity and belonging through the circulation of commodified imagery, through visual analysis, qualitative interviews, and quantitative surveys in multiple case studies across urban contexts. Results show that the visual representations are increasingly driven by aesthetics rather than authenticity and local narratives in more ways than not are placed on the periphery thus promoting the socio-spatial inequalities. Those who live in the city complain that they do not relate to urban visions sold to them on the market, instead, experiencing alienation and being deprived of the ability to construct their urban futures. In addition, the study also focuses on the emergence of grassroots movements that oppose the visual hegemonies and the effort of reclaiming representational and physical urban space. The article ends by urging the adoption of inclusive models of urban governance that are capable of challenging domination of visual commodification and joining together to enforce collectivity, rights to engage, producing, using, and shaping urban space.

ROLE OF WOMEN IN SUSTAINABLE DEVELOPMENT: CHALLENGES AND OPPORTUNITIES

Fatima Osmani
International Ahlulbait University, Faculty of Women Studying, Department of Family law, Tehran-Iran, Tehran-Iran,
Email. fatimaosmani740@gmail.com

ABSTRACT

Women and Development is a significant topic in social sciences and development studies that focuses on the role, status, and participation of women in the process of societal growth and progress. In the past, women's roles were often overlooked, and their contributions were mostly confined to family responsibilities. However, with the expansion of education, awareness, and cultural as well as economic transformations, women have emerged as key pillars of development. Sustainable development cannot be achieved without the effective participation of women in social, economic, cultural, and political fields. This study examines the concept of women and development, the historical evolution of women's participation in development, and the existing barriers such as gender discrimination, inequality of opportunities, weak legal protections, and traditional cultural attitudes. It also highlights the importance of empowering women through education, employment, political participation, and access to resources. Research shows that countries prioritizing gender equality and women's involvement perform better in human, economic, and social development indicators. In conclusion, true development can only be realized when women actively participate as decision-makers in society, and national policies are designed and implemented based on principles of gender justice and equal opportunity.

ABSTRACT

Onion (Allium cepa) is a vital cash crop in Bangladesh, yet farmers continue to experience production and marketing challenges that limit profitability. This study explored cultivation techniques, storage systems, extension support, and farmers' perceptions with a special focus

on cost and income-related factors. Using data from 67 growers collected through a structured questionnaire, the analysis revealed that onion cultivation is concentrated in sandy-loam and clay soils. Despite its importance, farmers overwhelmingly relied on traditional storage methods, resulting in significant post-harvest losses and increased production costs. Respondents emphasized the need for modern training opportunities, better-quality seeds, improved irrigation infrastructure and accessible credit to reduce risks and enhance returns. Good seed quality and high-yielding varieties were identified as key drivers of productivity, supported by the use of organic fertilizers. Extension services played a major role with most farmers receiving guidance from agricultural officers, although limited market stability and insufficient credit facilities continued to hinder investment in improved practices. The study highlights the need for strengthened farmer capacity-building, wider availability of quality seed, affordable financial support and modern storage solutions to increase profitability, reduce dependence on imports and ensure sustainable growth of the onion sector in Bangladesh.

ABSTRACT

Agro-industrial by-products have become an important resource in modern food innovation, driven by growing consumer interest in nutritious and environmentally sustainable products. Among these by-products, press cakes obtained from oil extraction, particularly those derived from pumpkin and walnut seeds, are known for their rich nutritional composition, including proteins, dietary fiber, essential fatty acids, and antioxidants. This study explores the incorporation of walnut and pumpkin seed press cakes into salami formulations to develop novel, nutrient-rich products that meet consumer demands and support sustainable practices. In this study, five salami formulations were developed as follows: a control summer salami (SSc), SS3%pp, summer salami prepared by substituting 3% cured meat with pumpkin press cake powder, SS5%pp, summer salami prepared by substituting 5% cured meat with pumpkin press cake powder, SS3%wp, summer salami prepared by substituting 3% cured meat with walnut press cake powder, and SS5%wp, summer salami prepared by substituting 5% cured meat with walnut press cake powder. The different salami formulations were evaluated for their physicochemical properties, energy value, texture profile, color attributes, and sensory characteristics. The incorporation of press cake powders into summer salami resulted in a product with a more complex lipid profile enriched in unsaturated fatty acids, increased fiber and mineral content, and slight textural changes, without compromising sensory quality. Incorporating press cake powders into salami enhanced its nutritional value and lipid profile without raising production costs. The approach maintained product quality while promoting sustainability by valorizing agro-industrial by-products, supporting a circular economy. These findings demonstrate that press cake inclusion is a viable strategy for developing nutrient-enriched, responsibly produced meat products that meet consumer expectations.

ABSTRACT
One of the most significant challenges facing humanity in South Asia is migration caused by climate change. By 2050, 9.6 million people in Bangladesh alone are expected to be displaced as a result of these changes. A major obstacle to response planning and adaptation of the affected areas is the lack of systematic designation of migratory hotspots, despite the fact that the prevalence of climatic disasters such as floods, cyclones, and droughts has been documented in detail. In order to identify and analyze climate-induced migration locations in Bangladesh's administrative units, the study suggests a multi-factor Migration Risk Index (MRI) that integrates satellite-derived indicators of climatic risks, socioeconomic exposure measures, and nightlights-based development proxies. Five independent climate and environmental indices for the years 1994 to 2024 across Bangladesh's administrative divisions were created using Google Earth Engine (GEE): (1) Sentinel-2 synthetic aperture radar (SAR) data-based flood frequency; (2) Landsat 8 NDVI trend analysis mapping vegetation stress areas; (3) CHIRPS rainfall anomalies cutting drought areas; (4) flood exposure derived from the digital elevation model (DEM); and (5) NOAA VIIRS nightlight trends as a proxy for economic activity. Following normalization (0-1 range). The population census 2021 was used to collect data for each district, resulting in population-weighted MRI scores. Trends in population density and economic displacement signals from sources based on nightlights were used in the validation procedure.

ABSTRACT

A pot experiment was conducted in Botanic Garden of Government college university Faisalabad to assess the responses of two differently salt tolerant wheat varieties (Dilkash and Urooj) to exogenously applied Sucrose and H_2O_2 as seed priming under saline stress. Seeds of two wheat varieties were soaked in sucrose (0mM, 25mM) and hydrogen peroxide (0mM,1mM) for 16 hours with Nacl salt levels (0mM and150 mM). Salt stress markedly decreased the growth attributes, imbalance nutrient and yield reduction while enhanced the level of H_2O_2, malonaldehyde accumulations of osmolytes and regulated antioxidative defense mechanism in both wheat varieties. The seed priming with signaling molecules in both wheat varieties enhanced the content of enzymatic as well as non-enzymatic antioxidants. Seed priming with signaling molecules caused a significant improvement in k+/Na+ in both wheat varieties but more improvement was in Dilkash. In conclusion, Sucrose and Hydrogen peroxide pre-sowing treatments induced salt tolerance with improved chlorophyll content, water relations, accumulation of osmolytes, antioxidative defense mechanism and improved yield.

OBSERVING NESTING BIRDS ON THE SOUTH KHANGAI PLATEAU IN SPRING

Tsegmid Namsraijav
Mongolian University of Life Sciences
Email: Tsegmid@muls.edu.mn
Badamjargal Sodnom
Mongolian University of Life Sciences

ABSTRACT

The South Khangai Plateau is a vast, sloping plateau located at the foot of the southern macroslope of the Main Khangai Range and gradually descending toward the Gobi Lakes Valley, where it drops off into a steep escarpment. The plateau is crossed by three major rivers—the Baidrag, Tuin, and Taats—whose headwaters lie in the Main Khangai Range. These rivers flow through deep but wide valleys with well-defined terraces; in a few places, the valleys narrow, forming gorges. The main part of the plateau surface lies at absolute altitudes of 1250-2100 m, but individual mountains and ridges rise up to 2700 m above sea level. The Tuin River is part of the Central Asian Basin, and its surroundings are located in the Ulziyt soum of the Bayankhongor aimag. Ulziit soum is located 18.6 kilometers east of the aimag center. The field study area is located in the Bayanburd is located approximately 7 kilometers from the center of Ulziit soum. It is located approximately 1 kilometer northeast of the Tuin River basin. The primary research method was foot-based route surveys, covering a total of over 30 km. The total area covered was 49,88 ga. The birds were observed on April 9, 2024. Bird counts were conducted using a ZESS CONQUEST HD 8*32 binoculars and a SONY DSC-HX400 digital camera with 20.4 megapixels. Bird names in the list are based on the summary by S. Gombobaatar, 2019, and the faunal genetic structure by Stegmann, 1938. In the Bayanburd (western south part of Mongolia) 19 species of birds belonging to 6 orders, 9 families and 17 genera are recorded. The dominant ecological group of the avifauna of the Bayanburd is campophiles, which account for 9 (47%) species; 5 (26%) are dendrophiles, 3 (17%) species are sclerophylls. In wetland areas 2 (10%) species limnophiles are found. The avifauna of Bayanburd, where the mining area is located, is widely represented by mid-latitude species. According to the ornithogeographic division of B.K. Stegman (1938), they belong to the following fauna types: Mongolian 47% (n=9), Transpalearctic 21% (n=4), Mediterranean 11% (n=2), European 11% (n=2), Tibetan 5% (n=1) and Arctic 5% (n=1). During the observation, 3 species of birds (*Eremophila alpestris*, *Oenanthe isabelline*, *Petronia petronia*) were frequently encountered. The *Eremophila alpestris* is the dominant species in the Bayanburd region. Three bird species found in the spring in the Bayanburd area of the Tuin River basin of Bayankhongor aimag are listed in Appendix II of the CITES Convention: the steppe eagle (*Aquila nipalensis*), the cineteous vulture (*Aegyrius monachus*) and the bearded vulture (*Gypaetus barbatus*). Thus, in the western part of the country nesting species include the steppe eagle, cinereous vulture, northern raven, horned lark, isabelline wheatear and rock sparrow. According to Bold, steppe eagle (*Aquila nipalensis*) begins nesting in the Khentii mountain region in early May. However, during our research in this area, which forms the northern boundary of South Khangai Plateau, egg laying was observed as early as April 9. The bearded vulture (*Gypaetus barbatus*), who live in the mountains around Bayanburd, eat Mongolian gerbil (*Meriones unguiculatus*).

CLASSIFICATION OF MULTIFIDUS SURFACE ELECTROMYOGRAPHY FOR LOW BACK PAIN DETECTION: SUPERIOR PERFORMANCE WITH FREQUENCY-DOMAIN FEATURES

ABSTRACT

Low back pain (LBP) affects millions worldwide and lacks objective diagnostic biomarkers. This study aimed to evaluated surface electromyography (sEMG) features from bilateral multifidus muscles to discriminate LBP patients from healthy controls during trunk movements. EMG signals from 22 participants (12 healthy, 10 LBP) were recorded during flexion and extension tasks. After preprocessing (bandpass Butterworth and notch filtering), signals were segmented, rectified, smoothed, and characterized using time-domain, frequency-domain, and time–frequency descriptors. Seven classifiers—Support Vector Machine, K-Nearest Neighbors, Decision Tree, Linear Discriminant Analysis, Random Forest, Logistic Regression, and Extreme Gradient Boosting—were trained and evaluated via stratified 5-fold cross-validation. Frequency-domain features consistently outperformed time-domain and time–frequency descriptors. Random Forest achieved 86% accuracy using combined frequency features for extension tasks, while Decision Tree reached 85% accuracy on the same feature set. Extension movements yielded superior discrimination compared to flexion (86% vs. 78% accuracy). ROC-AUC analysis confirmed strong classifier discrimination (AUC >0.80 for optimal models). These findings establish multifidus sEMG frequency signatures as discriminative biomarkers for LBP detection. Systematic feature selection combined with ensemble classifiers effectively identifies abnormal muscle activation patterns associated with LBP. The clinical utility of frequency-based sEMG analysis warrants further investigation for objective, non-invasive LBP diagnosis in clinical settings, rehabilitation monitoring, and wearable health systems.

Keywords: Surface electromyography, Low back pain, Multifidus, Multi-domain analysis, Machine learning.

ABSTRACT

Smart Blind Assistant Glasses aim to enhance the mobility, safety, and independence of visually impaired individuals by integrating modern computer vision, deep learning, and assistive technologies. These glasses are designed to detect and recognize real-world objects, obstacles, and people in the environment using advanced object detection algorithms such as YOLO and deep neural networks. The system provides real-time audio feedback, allowing the user to perceive surroundings through auditory cues rather than sight. Spoken instructions such as “person ahead,” “door on right,” or “stairs down” guide the user for safe navigation. The prototype utilizes a camera module, microcontroller, and audio output system to process live video feeds and convert them into descriptive audio information. Techniques like image processing, object tracking, and distance estimation are used to ensure accurate detection and timely alerts. The dataset used for training includes diverse real-world objects and environmental conditions to enhance system reliability. Experimental results show that the model achieves efficient object recognition with real-time response and minimal latency, ensuring smooth navigation. The integration of YOLO-based detection improves accuracy compared to traditional methods. Future work aims to include GPS-based navigation, voice-command control, and edge AI optimization for standalone wearable operation, making the system more intelligent and user-friendly for visually impaired individuals.

ABSTRACT

Satellite image segmentation plays a vital role in urban planning by providing detailed insights into land use, infrastructure, and environmental conditions. With rapid urbanization, traditional manual mapping methods are no longer efficient for large-scale city analysis. This project leverages deep learning techniques, specifically the U-Net model, to perform automated and accurate segmentation of high-resolution satellite images. The U-Net architecture, known for its encoder-decoder structure with skip connections, enables precise pixel-level classification of satellite imagery. Using datasets such as DeepGlobe Land Cover, the model is trained to identify and categorize key urban features including buildings, roads, vegetation, and water bodies. The preprocessing steps involve image enhancement, noise removal, and annotation to improve data quality and model performance. By integrating the segmented results into Geographic Information Systems (GIS), urban planners can visualize spatial layouts, monitor land-use changes, and assess environmental impacts. This approach supports smart city development, resource management, and disaster preparedness by enabling data-driven decisions. The U-Net model's efficiency and high accuracy make it a powerful tool for sustainable urban development and real-time city monitoring.

ABSTRACT

New dinuclear vanadium(V) Schiff base complexes were successfully synthesized and characterized for application as recyclable catalysts in organic synthesis. Two water-soluble oxo-bridged complexes, $[(L1H)VO(\mu\text{-}O)]_2$ (C1) and $[(L2H)VO(\mu\text{-}O)]_2$ (C2), were prepared through the reaction of $VOSO_4$ with tetradentate Schiff base ligands under reflux in methanol. Their catalytic activity was investigated in the oxidation of olefins using water as an environmentally friendly reaction medium and different oxidizing agents. The dinuclear complexes demonstrated excellent catalytic efficiency, high product yields, and remarkable stability over multiple catalytic cycles. These results highlight the potential of oxovanadium(V) dinuclear systems as efficient and reusable catalysts for green organic transformations.

Keywords: Green catalysis ; Olefin oxidation; Vanadium(V) complexes

DETERMINISTIC AND PROBABILISTIC ANALYSIS OF WEDGE SLIDING POTENTIAL IN ROCK SLOPES

ABSTRACT

Kinematic analysis is a widely used method for assessing the discontinuity controlled stability in rock slopes. The method evaluates planar, wedge, and toppling failure mechanisms. Risks associated with different failure types are analyzed using stereographic projections. The dip and dip direction of the slopes, along with the distribution and intersections of discontinuity planes, are considered in the analyses. Wedge sliding, one of these failure mechanisms, occurs when at least two discontinuity planes or sets intersect unfavorably, forming a wedge-shaped rock block that slides along the intersection line. In this study, the wedge sliding potential of the western slopes of the abandoned quarry in Kartal, Istanbul, was investigated. Kinematic analyses were conducted on four slopes, designated as S-1, S-2, S-3, and S-4. The results indicated that failure probabilities ranged from 14.3% to 49.3%, suggesting that the slopes are susceptible to wedge sliding. The risks for each slope were evaluated using deterministic and probabilistic approaches, based on the calculated failure probabilities and factors of safety. To this end, the dominant orientations of discontinuity sets that may contribute to wedge sliding were determined by employing the Fisher distribution and Goodman's graphical approach. These dominant discontinuity sets, located within the critical zone on the stereonet, were analyzed for each slope under static and dynamic conditions. Under static conditions, the number of dominant intersecting discontinuity sets that fell below the required factor of safety criterion ($FoS \geq 1.5$) was determined to be three, two, five, and two, corresponding to slopes S-1 to S-4. Dynamic analyses indicated that earthquake-induced effects increased the count of the critical dominant discontinuity sets. Under dynamic conditions, these intersecting sets that did not meet the required factor of safety ($FoS \geq 1.0$) increased to four, three, seven, and three, respectively. Both deterministic and probabilistic analyses revealed a reduction in the calculated factors of safety under dynamic conditions. On average, the rate of decrease ranged from 26.2% to 55.6% compared to static conditions. Consequently, the study demonstrated that some dominant discontinuity sets of the slopes, which pose no significant risks under static conditions, may reach critical states during an earthquake and cause wedge sliding.

Keywords: Deterministic analysis, factor of safety, probabilistic analysis, rock slope, wedge sliding.

COMPARATIVE ASSESSMENT OF GROWTH PERFORMANCE AND SURVIVAL RATE OF MONO-SEX AND MIXED-SEX NILE TILAPIA (*OREOCHROMIS NILOTICUS*) IN CAGE CULTURE SYSTEMS: EVIDENCE FROM SOUTHERN BANGLADESH

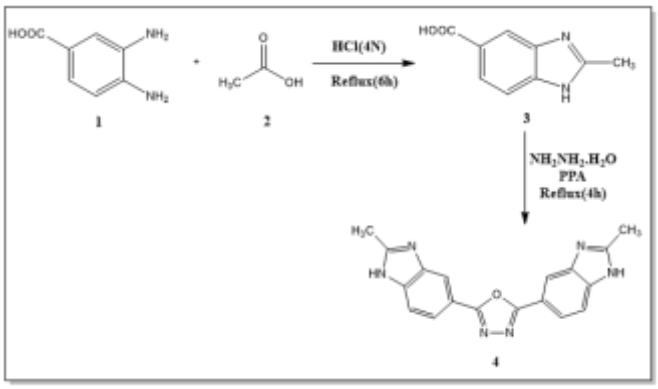
ABSTRACT

An experiment was conducted in a cage culture system over 90 to observe the growth and survival rate of mono-sex and mixed-sex Nile tilapia at Bhandaria, Pirojpur district of Bangladesh. The experiment was carried out with three treatments containing three replications. In treatment 1 (T_1) mono-sex tilapia, in treatment 2 (T_2) mixed-sex tilapia, and treatment 3 (T_3) mono-sex + mixed-sex (50:50) tilapia were stocked. During the study period, key water quality parameters were measured fortnightly and found to be within the acceptable range for aquaculture. At the beginning of culture period, the average individual weight (±SD) was 9.5 ± 1.33g, 10.02 ± 1.75g, and 9.85 ± 1.82g in T_1, T_2, and T_3 respectively with similar stocking density (5 fish/square feet). Fish were fed commercially available floating fish feed (28% protein) with 6% body weight at the beginning of experiments and gradually reduced to 3%. The Mean final weights were 262.78 ± 12.40g, 245.30 ± 13.32g, and 252.14 ± 15.25g in T_1, T_2, and T_3 respectively. However, there were no significant ($P>0.05$) differences observed in mean final weights among T_1, T_2, and T_3. The specific growth rate (SGR) was significantly ($P<0.05$) higher in T_1 (3.22 ± 0.02), followed by T_3 (3.12 ± 0.03) and T_2 (2.99 ± 0.09). No significant difference ($P>0.05$) was observed among treatments in case of total production. The benefit-cost ratio (BCR) was calculated as 1.15, 1.13, and 1.14 in T_1, T_2, and T_3, respectively, which did not differ significantly. The present findings indicate that the production of mono-sex and mixed-sex Nile tilapia has been successful. When mono-sex Nile tilapia are unavailable to farmers, they can culture mixed-sex Nile tilapia in cages up to the spawning period (approximately 3-4 months), thereby improving the economic situation of rural farmers as an alternative source of income.



Keywords: Mono-sex, Mixed-sex, Nile tilapia, cage culture, growth performance.

SYNTHESIS, CHARACTERIZATION, AND COMPUTATIONAL INVESTIGATION OF 2,5-BIS(2-METHYL-1H-BENZIMIDAZOL-5-YL)-1,3,4-OXADIAZOLE: QUANTUM CHEMICAL ANALYSIS, ADME PREDICTION, MOLECULAR DOCKING, AND MD-BASED CORROSION STUDY FOR PHOTONIC AND THERAPEUTIC APPLICATIONS"

ABSTRACT
This study presents the synthesis and characterization of 2,5-bis(2-methyl-1H-benzimidazol-5-yl)-1,3,4-oxadiazole, using ^{1}H NMR, ^{13}C NMR, mass spectrometry and FTIR-ATR infrared spectroscopy. Quantum chemical analysis revealed that P1 possesses a balanced electrophilic–nucleophilic profile, enabling interactions with diverse biological targets. Its HOMO–LUMO gap and electronic stability suggest potential applications in photonic devices. ADMET predictions indicated favorable pharmacokinetics and overall drug-likeness. Molecular docking demonstrated high binding affinities toward anticancer, antibacterial, and antifungal proteins, with P1 reproducing reference ligand binding modes while forming additional stabilizing contacts. Molecular Dynamics simulations captured the thermal motion and conformational flexibility of P1 on the Fe(110) surface, while Monte Carlo simulations identified energy-minimized, compact adsorption conformations. Both approaches confirmed thermodynamically favorable chemisorption, stabilized by direct surface interactions and solvent/ionic contributions. Together, these findings highlight P1 as a dual-purpose scaffold, combining selective biological activity, favorable electronic properties, and strong surface interactions. This integrated computational study supports its potential for both therapeutic development and optoelectronic application.

ABSTRACT

Background: Rice Bran (RB) and Rice Polish (RP) are by-products of rice milling industry where further oil extraction from RB produces De-oiled Rice Bran (DORB). All of these by-products are often underused because they contain anti-nutritional factors (ANFs), have high fiber content, and limited nutrient availability. This study aimed to improve the nutritional potentiality through yeast fermentation. Methods: Three rice by products (RB, RP and DORB) were employed in a 2×3×9 factorial experiment with Baker's yeast (*Saccharomyces cerevisiae*) at 1.0 and 2.0% level, with three moisture levels (40, 50, 60%) and 9 times (0, 6, 12, 18, 24, 30, 36, 42, 48hours), incubated at 39°C in 100ml glass syringe. The fermentation efficiency was measured by cumulative gas production, ethanol yield, change in proximate composition, and availability of phosphorus (AvP.). Results: Fermentation of RB was maximum, with 2932ml/100g DM gas at 6h and 3.49g/100ml ethanol at 48h at 60% moisture level and 2.0% yeast. Its crude protein (CP) was raised by 23.1%, crude fiber (CF) was lowered by 20.1%, ether extract (EE) doubled nearly, metabolizable energy (ME) by 27.0%, and AvP. 0.27 to 0.42. RP was found as moderately fermentable by 713ml/100g DM gas and 1.45g/100ml ethanol, whereas nutritional improvement was noticed with an 18.2% reduction of CF, 66% increase in EE, 9.5% increase in ME, and AvP. from 0.95 to 1.26. DORB was least fermentable but showed considerable nutritional improvements, including a 15.6% improvement in CP, 18.9% reduction in CF, 294% increase in EE, 22% increase in ME, and a change in AvP. from 0.82% to 1.02%. Conclusion: Fermentation significantly improved the nutritional potential of RB, RP, and DORB, with RB having the highest protein, ME, and AvP. Though RB was most fermentable, RP was partially improved, whereas DORB, despite low fermentability, had high protein, fiber removal, and phosphorus bioavailability.

ABSTRACT
This work focuses on developing low-temperature catalytic routes to convert renewable lignocellulosic biomass into advanced carbon materials with graphitic or graphene-like structures. The study relies on strategies designed to guide carbon reorganization during carbonization. By using catalysts that lower the activation energy, effective graphitization can be achieved at temperatures significantly lower than those required by conventional methods. The goal is to produce graphitic or graphene-like carbons with tunable porosity, heteroatom doping, and, when needed, metal functionalities, in order to meet the growing demand for sustainable graphite materials in fields such as energy storage and electronics. Special attention is given to how preparation conditions influence the final properties, to better understand the key parameters governing performance. Overall, this research aims to establish a tunable and energy-efficient approach for producing next-generation porous carbons from sustainable biomass resources
Keywords : Graphite, Graphene, Biomass.

ABSTRACT
3D face reconstruction using Convolutional Neural Networks (CNNs) is an emerging technique that enables the generation of accurate three-dimensional facial models from single or multiple two dimensional images. This process is crucial for applications in security, animation, virtual reality, and human–computer interaction. Traditional 3D modeling methods require specialized hardware such as depth sensors or multi-view camera setups, which are expensive and time-consuming. In contrast, CNN-based methods leverage deep learning to infer 3D geometry directly from 2D image data. These networks learn hierarchical features that capture facial structure, shape, and texture. By training on large datasets, CNNs can generalize well to variations in pose, lighting, and expression. This makes the approach robust and suitable for real-time applications. The proposed system typically consists of a feature extraction module followed by a regression or decoder network that reconstructs the 3D facial mesh or depth map. Loss functions are designed to minimize geometric errors, photometric inconsistencies, and sometimes perceptual differences between the predicted and ground truth models. Data augmentation techniques are applied to enhance performance on diverse real-world conditions. The reconstructed faces can be refined using post-processing algorithms for improved accuracy. Integration with 3D Morphable Models (3DMM) further enhances reconstruction quality. This CNN-based approach significantly reduces computational cost while maintaining high fidelity in facial details. As a result, it offers a scalable and efficient solution for various biometric and multimedia applications.

Keywords: 3D Face Reconstruction, Convolutional Neural Networks (CNNs), Deep Learning, Feature Extraction, 3D Morphable Model (3DMM)

ABSTRACT

Millets are significant grains worldwide, yet they remain underutilized. They are rich in nutrients and health-beneficial phenol compounds, such as phenol acids, flavonoids , and tannins, which contribute to high antioxidant activity. The presence of these photochemical can improve human health by, for example, reducing cholesterol levels .The nutritional and phenol content varies between millet species. Finger millet, for instance, possesses a more abundant and diverse phenol profile compared to pearl millet. This diversity indicates that the specific type of millet is an important consideration when selecting it for food or feed .Given the high demand for maize across multiple industries, millets offer a viable alternative to ease this pressure. Studies show that substituting maize with pearl or finger millet in animal diets has a positive impact on livestock performance. For example, incorporating 50% or more pearl millet into broiler diets does not adversely affect growth or egg production. Beyond animal feed, millet grain is also being used in a variety of foods and traditional beverages. This review aims to provide comprehensive insight into the nutritional and phenol properties of millets and their impact on both human and livestock health .In a separate five-month study, we investigated the use of raw urban wastewater (RWW) and treated wastewater (TWW) from a Trickling Filter process for irrigating millet, using well water (WW) as a control. We assessed the crop's agro physiological and biochemical properties .The results showed that irrigation with both RWW and TWW led to the highest millet productivity and leaf area compared to WW. Macro-elements like total phosphorus (TP), total Kjeldahl nitrogen (TKN), and potassium (K) were also higher in plants irrigated with RWW. In contrast, plants irrigated with well water accumulated more calcium (Ca), sodium (Na), and magnesium (Mg).Furthermore, the use of treated urban wastewater improved the soil's physicochemical properties and fertility compared to well water, thereby enhancing crop productivity.

HARVESTING URBAN WISDOM: A POLICY BLUEPRINT FOR SUSTAINABLE NIGERIA INSPIRED BY LATIN AMERICA'S TALES AND ECOLOGICAL ECHOES

ABSTRACT

Nigeria's economic journey bears striking similarities to Latin America's past, with an over-reliance on raw material exports and weak institutions hindering growth. Our research draws valuable lessons from Brazil, Argentina, and Chile to propose a policy blueprint for a sustainable Nigeria. We recommend modernising agriculture, embracing sustainable mining practices, and adopting smart urbanisation strategies. These measures, coupled with economic diversification, climate action, and transparent governance, are vital for Nigeria's long-term resilience. The Nigerian economy can learn from Latin America's experiences, such as Brazil's innovative agribusiness sector and Chile's responsible mining model. By adopting climate-smart agriculture and agro-processing, Nigeria can enhance food security and boost exports. Moreover, smart planning, investment in public transport, and green infrastructure can help address urbanisation challenges. Our blueprint provides policymakers with actionable recommendations, including mechanised commercial farming, R&D investment, and transparent licensing for mining. By implementing these strategies, Nigeria can break free from resource dependency and build a diversified economy, ensuring sustainable economic growth and environmental stewardship.

ABSTRACT

Spices are most widely used culinary ingredients of Bangladesh along with many other countries of the world. This study shows the nutritional values, presence of many pharmacologically important phytochemicals and antimicrobial activities of four spices (cinnamon, clove, cardamom, and black pepper) used widely in the many types of food preparation of Bangladesh. Spices were collected from the local groceries of Sylhet city, Bangladesh. The proximate composition, total phenolic and flavonoid contents, presence of several phytochemicals, and antibacterial properties of the collected spices were all examined. The proximate analysis revealed the spices are excellent sources of many essential nutrients. The maximum amount of dry matter was present in cardamom (92.13%), ash and crude fiber in clove (8.77% and 14.29% respectively), crude protein in black pepper (10.97%) and ether extract in cinnamon (4.98%). The study also showed the presence of many pharmacologically active phytochemicals such as flavonoids, terpenoids, sterols, saponins and coumarins in various types of spice extracts. Quantitative analysis of the phenolic and flavonoid content demonstrated a great deal larger number of phenols (128.06 mg GAE/g spices) and flavonoids (45.75 mg QE/g spices) in clove. Clove along with cinnamon also showed to have significant antimicrobial potentials against *Salmonella typhimurium* and *Escherichia coli* with respect to the methods used for testing the antimicrobial activities, and again, clove showed the larger inhibition zones against the tested bacterial isolates. For that reason, these spices have the potential to treat illnesses brought on by *Salmonella typhimurium* and *Escherichia coli* instead of using antibiotics.

ABSTRACT

Biosynthesis of AgNPs using *Coleus amboinicus* offers an eco-friendly approach with significant potential for biomedical applications due to their natural, non-toxic properties. *Coleus amboinicus* has proved to be a therapeutic agent for its medicinal properties. This study aimed to biosynthesise AgNPs from *Coleus amboinicus* extract to control antibiotic-resistant respiratory bacteria from post-COVID-19 patients and investigate potential natural inhibitors through in silico approaches. Three multidrug-resistant bacteria, including *Bordetella pertussis*, *Streptococcus pneumoniae*, and *Corynebacterium diphtheriae*, were isolated from post-COVID-19 patients and identified by 16S rRNA sequencing. Phytochemical analysis of *Coleus amboinicus* (Mexican mint) revealed 46 bioactive compounds. Green-synthesised silver nanoparticles from this leaf were characterised by UV–Vis, FTIR, DLS, XRD, and TEM, as well as assay cytotoxicity and antioxidant activity. The study isolated antibiotic-resistant respiratory pathogens, including *B. pertussis*, *S. pneumoniae*, and *C. diphtheriae*, and 16S rRNA sequencing revealed their virulence-associated receptors: (PtxA) pertussis toxin, (PLY) pneumolysin, and (DT) diphtheria toxin, respectively. Silver nanoparticle synthesis was confirmed by a colour change and UV–Vis peak at 434 nm. FTIR revealed alcohols, phenols, and alkenes as capping agents. DLS showed a mean size of 53.84 nm, while XRD and TEM confirmed spherical, face-centred cubic crystals. BSLA indicated low cytotoxicity (LC_{50} = 1475 µg/mL), and the DPPH assay showed 75% antioxidant activity. The AgNPs inhibited pathogens dose-dependently, with MIC values of 2 µg/mL against *B. pertussis*, *S. pneumoniae*, and *C. diphtheriae*. Further, molecular docking showed campesterol and 1-phenanthrenecarboxylic acid had strong binding to PtxA, PLY, and DT. ADMET analysis indicated no adverse effects, and 100 ns MD simulations confirmed their stability. These findings suggest that green-synthesized silver nanoparticles effectively inhibited these antibiotic-resistant respiratory pathogens in a dose-dependent manner. In the future, it could be a better, cheaper, and safer alternative to antibiotics.

ABSTRACT

Optimizing the operational performance and capacity of urban intersections hinges on the efficient setting of signal timing parameters. This capacity is primarily governed by the green time allocation, the overall cycle length, and the complex composition of traffic flows. In the context of Algeria, the rapid expansion of car ownership coupled with a notable absence of locally adapted design guidelines presents significant hurdles for traffic engineers who often rely on uncalibrated international models. This study's key findings demonstrate that the enhancement of shared lane capacity through extended green time is subject to an optimal threshold, beyond which additional timing provides only marginal benefits. Crucially, the traffic composition, particularly the proportion of challenging left-turning vehicles, is found to exert a more potent influence on lane capacity than the signal timing parameters alone. These results underscore the urgent necessity of developing and implementing local signal control strategies tailored to specific traffic flow characteristics to ensure more efficient and sustainable intersection performance in the region.

Keywords: Turning movements; Shared lane capacity; Signal green time; Traffic composition; Algeria.

EFFECT OF RAINFALL ON SLOPE STABILITY USING FINITE ELEMENT METHOD (FEM): A CASE STUDY IN RANGAMATI, BANGLADESH

ABSTRACT

Landslides triggered by intense rainfall regularly threaten lives and infrastructure in hilly regions such as Rangamati. This study analyzes a specific landslide event near Rangamati to evaluate how rainfall infiltration impacts slope stability. A numerical approach using the finite element method (FEM) was employed to simulate variations in rainfall intensity and duration, assessing their influence on the slope's factor of safety (FS). Initially, under dry conditions, the slope exhibited a relatively high FS; however, prolonged rainfall significantly reduced slope stability by increasing pore-water pressure and reducing soil shear strength. Simulation results revealed that after continuous rainfall, FS dropped below the critical value of 1.0, indicating imminent slope failure. This research underscores the necessity of integrating hydrological and geotechnical considerations into slope stability assessments, particularly in monsoon-affected areas. The successful application of FEM provides valuable insights for predicting rainfall-induced landslides and developing proactive strategies to mitigate their risks.

ABSTRACT

Low back pain (LBP) is a common problem that affects daily life. This study compares statistical differences in surface electromyography (sEMG) signals between 15 healthy subjects and 10 LBP patients during the contraction phase of the Seated Side bend (SB) exercise. To process these signals, we used two methods e.g., conventional filtering (CF) and wavelet-based analysis with 'sym5' and 'db4' wavelets to derive time-domain and time-frequency domain features. Statistical analysis using t-tests revealed that wavelet-based filtering, especially with db4 and sym5, outperformed conventional methods in terms of noise suppression and feature extraction reliability. These findings indicate that wavelet-based sEMG signal analysis is more effective for differentiating muscle activity in LBP patients. The study had a small sample size, which should be improved in future research. Wavelet techniques show potential for improving clinical diagnosis and biomedical research in musculoskeletal disorders.

Keywords: Low Back Pain, sEMG, Signal Processing, Bandpass Filtering, DWT, Feature Extraction, Time-Frequency Domain.

GENETIC DIVERSITY AND POPULATION STRUCTURE OF CLIMBING PERCH (*Anabas testudineus*) COLLECTED FROM SOUTHEAST ASIA BASED ON MITOCHONDRIAL CYTOCHROME C GENE SEQUENCE ANALYSIS

Mahmud, M.R.A
M.S. Fellow, Department of Fisheries Biology and Genetics, BAU, Mymensingh
Email: *imrakib.2018@gmail.com
Alam, M.S.
Professor, Department of Fisheries Biology and Genetics, BAU, Mymensingh.

ABSTRACT

Anabas testudineus (climbing perch) is an ecologically and commercially important freshwater fish distributed across Asian countries. However, its population genetic structure in the Southeast Asian region remains poorly understood. This study conducted the genetic diversity and population structure of Bangladesh, Thailand, India, Indonesia, Philippines and Vietnam using mitochondrial cytochrome c oxidase subunit I (COI) gene sequences. A total of 81 sequences revealed a nucleotide composition biased regards AT (53.3%) with a deficiency of Guanine (G), suggesting consistent patterns in relation to other climbing perches. Overall, the rate of transition/transversion bias was 12, indicating the prevalence of transitions over transversions. High haplotype diversity (Hd = 0.82) coupled with low nucleotide diversity (π = 0.04) suggested significant haplotypic variation but relatively low divergence sequence, reflecting a recent population expansion or strong connectivity. The mean genetic distance among sequences was 0.05, within population diversity remarkably lower than between population divergence. Bayesian inference tree analysis revealed two well-supported clades, forming clusters of some intermixed populations. Haplotype network analysis identified 14 haplotypes, with Hap_6 being the most common, highlighting both diversity and complex evolutionary relationships. Population differentiation was overall high (F_{ST} = 0.70), with 11 pairwise differentiations being detected as moderate to high and significant among six distinct populations. These findings demonstrated that *A. testudineus* in six populations are genetically diverse and strongly structured. The results provide a valuable baseline information for the conservation, broodstock management and sustainable fisheries of *A. testudineus* in the Southeast Asian regions.

Keywords: *Anabas testudineus*, Genetic Diversity, Population Structure, COI, Southeast Asia.

MAGNETIC GRAPHENE OXIDE (MGO): THE BEST SOLUTION FOR REMOVING HEAVY METALS FROM WATER.

Prial Chowdhury
University Name: University of Chittagong
Email: prialchowdhury5436@gmail.com

ABSTRACT

Only 1% of the water on Earth is readily accessible for human consumption, with freshwater accounting for approximately 3% of the total. Unfortunately, urbanization, industrialization, and global evolution are also a threat to this finite supply of fresh water. In this study, we discussed the removal of heavy metal ions like Pb^{+2}, Cr^{+3}, Cu^{+2}, $Zn^{+2,}$ and Ni^{+2} from the water through the Magnetic Graphene Oxide (MGO) and indicated maximum removal efficiency with efficient reusability of drinking water. By fabricating the surface of graphene oxide (GO) with iron particles (Fe3+), a simple, quick, and easy technique was used to create magnetic graphene oxide (MGO). MGO was characterized using UV-VIS, FT-IR, SEM, XRD, and VSM. Efficient removal of toxic heavy metal ions from the water was studied using Atomic Absorption Spectroscopy (AAS). The adsorption performance of MGO was evaluated by examining the effects of various factors like pH, contact time, temperature, and adsorbent dose. The adsorption processes were spontaneous and endothermic, followed the Langmuir adsorption isotherm and pseudo-second-order kinetics model. The results exhibited that MGO is a competent adsorbent and disinfectant for safe drinking water.

Keywords: Water purification, Magnetic Graphene Oxide (MGO), Heavy metals, Atomic Absorption Spectroscopy (AAS).

COMPARATIVE EFFECTS OF CONVENTIONAL AND NO-TILLAGE SYSTEMS ON SOYBEAN PRODUCTIVITY AND SEED COMPOSITION UNDER MODERATE SALINITY

ABSTRACT

Introduction: Soybean (Glycine max L.) is a vital oilseed and protein source but its productivity in Bangladesh's coastal areas is still low due to salinity in soil, and nutrient deficiency. Tillage practices directly affect soil aeration, water infiltration, and nutrient cycling, which in turn influence crop performance and seed quality. Methods: A two-factor factorial field experiment was carried out using two tillage systems; conventional tillage and no-tillage; and two soybean varieties, Bangladesh Soybean-4 (BD-4) and BARI Soybean-6. A randomized complete block design with six replications was followed with standard agronomic management where plant growth, yield components, and seed nutritional composition were analyzed. Results: Both tillage and variety had strong effects on soybean performance. In case of conventional tillage, plant height, branching, chlorophyll content, and pod formation shown better improvement compared with no-tillage. Conventional tillage produces 43% greater seed yield than under no-tillage treatment. BARI Soybean-6 shown best outcome, particularly under conventional tillage. Nutritionally, seeds from this treatment hold 8% higher crude protein; better ether extract, and gross energy is also statistically higher than no tillage treatment. Positive relationships among chlorophyll content, seed yield, and biological yield confirmed that improved photosynthetic activity contributed directly to higher productivity. Conventional tillage had superior yield and grain quality other than no tillage which can turn it in a prospect. Conclusion: Conventional tillage significantly enhanced soybean growth, yield, and seed quality in saline coastal soils specially for BARI Soybean-6.

Keywords: soybean, tillage systems, coastal area, nutritional quality, saline soil

DESIGN OF NON-ADAPTIVE FILTERING AND WAVELET TRANSFORM TECHNIQUES FOR EMG NOISE REDUCTION

ABSTRACT
Electromyography (EMG) is an important tool for assessing neuromuscular activity; however, its diagnostic and analytical utility is often hindered by noise contamination, including motion artifacts, power line interference (PLI), and baseline drift. This study proposes and evaluates two advanced EMG denoising strategies: (i) Discrete Wavelet Transform (DWT) integrated with a bandpass filter and (ii) a non-adaptive filtering method involving an IIR notch filter combined with a bandpass filter. Twenty healthy participants were taken for EMG data collection from the medial head of the gastrocnemius muscle. The performed movements include dorsiflexion and plantarflexion. Raw EMG data was denoised using both denoising technique and noise mitigation efficiency was assessed using quantitative measures, including Signal-to-Noise Ratio (SNR), Slope Sign Change (SSC), Root Mean Square (RMS), and Zero Crossing (ZC). Statistical validation using a t-test disclosed that both approaches significantly strengthen EMG signal quality ($p<0.05$), where DWT-based technique attaining superiority in decreasing noise while retaining physiological aspects intact. These findings highlight the capability of wavelet-based filtering as a robust method for EMG denoising, offering potential to improve the accuracy of EMG-based clinical diagnostics, rehabilitation monitoring, and human–machine interface applications.

ABSTRACT

Electronic waste (e-waste) is rapidly emerging as a critical challenge within urban waste management systems in Bangladesh, owing to escalating electronic consumption, shortened device life cycles, and the absence of institutionalized recycling mechanisms. The study examines consumer awareness, behavioral practices, disposal patterns, and institutional limitations associated with e-waste management in Kushtia Municipality. The study employed a structured questionnaire survey, selecting 5 key administrative staff through purposive sampling, while 52 consumers and 18 electronic retailers were selected through random sampling from the municipal area, resulting in a total sample size of 75 participants. Findings reveal marked gaps in public knowledge, with only 55.8% of respondents familiar with the term ‘e-waste’, 25% aware of appropriate disposal methods, and merely 5.8% recognizing the need for specialized treatment. High ownership and frequent replacement of electronic devices, driven by technological obsolescence (42.9%) and malfunctioning (29.9%), substantially contribute to e-waste generation. Disposal remains largely informal, dominated by selling discarded items to unregulated scrappers (60-76%) or storing them at home, while environmentally unsafe practices such as dumping and burning persist. Furthermore, the complete absence of formal collection points and recycling staff, alongside widespread dissatisfaction with municipal waste services, highlights significant structural deficiencies. The

significance of this study lies in its contribution to understanding the behavioral and systemic factors underpinning e-waste mismanagement, offering evidence essential for developing integrated waste management strategies, strengthening regulatory frameworks, and designing targeted awareness interventions. By identifying critical gaps, the study provides actionable insights to support the transition toward a more sustainable and accountable urban waste management system.

Keywords: E- waste, Urban waste management, Consumer behavior, Recycling and disposal practices, Institutional limitations

SIMULATION-BASED EVALUATION OF METHANOL-DIESEL BLENDS IN CI ENGINES USING ANSYS: PERFORMANCE AND EMISSION INSIGHTS

Jai Gopal Gupta

ABSTRACT

This study presents a comprehensive simulation-based investigation into the viability of methanol as a supplementary fuel in compression ignition (CI) engines, conducted using ANSYS Forte. The results indicate a modest improvement in brake thermal efficiency and brake specific energy consumption (BSEC), attributed to enhanced combustion in fuel-rich zones and reduced in-cylinder heat losses due to methanol's lower flame temperature. While a slight increase in brake specific fuel consumption (BSFC) is observed—owing to methanol's lower energy density—the trade-off is offset by significant environmental benefits. Notably, methanol-diesel blends demonstrate a 15.96% reduction in NO_x emissions, a 3.39% decrease in CO_2, and substantial declines in particulate matter (PM) and smoke emissions by 51.37% and 44.13%, respectively. These improvements are linked to more complete combustion and effective oxidation of soot precursors. Validation of the simulation results was achieved through comparison with prior studies by Iliev et al. (2020), affirming the model's reliability. Future work will focus on experimental validation to further substantiate these findings and explore practical implementation pathways.

Keywords: Simulation using ANSYS, Methanol-Diesel, CI Engines.

ABSTRACT

With the rapid adoption of QR codes in payments, authentication, and information sharing, security risks have also escalated. Malicious actors increasingly exploit QR codes by embedding harmful links that redirect users to phishing websites, malware downloads, or fraudulent portals. Users often trust and scan QR codes without verifying the underlying content, making them vulnerable to cyberattacks. To address this issue, this project proposes an AI-based QR Code Safety System that analyzes embedded links for potential threats before allowing access. The system first extracts the URL from the scanned QR code and subjects it to multiple layers of security checks. Using machine learning and natural language processing, the AI model evaluates the domain reputation, URL structure, and contextual patterns associated with phishing or scam sites. Additionally, it integrates threat intelligence databases and malware blacklists to detect known malicious sources. Suspicious or unsafe links are flagged and blocked, while safe links are allowed to open seamlessly. This solution aims to enhance user confidence by providing real-time QR code verification without disrupting convenience. The project contributes to safer digital transactions, secure information sharing, and effective defense against phishing attacks, making it a valuable tool for individuals, businesses, and financial institutions.

ABSTRACT

This paper presents the ongoing development of an innovative modular hardware-software system designed for the discreet implementation of authorized technical surveillance measures under national security warrants, within the framework of the Romanian SOL2024-T6 project funded by UEFISCDI and coordinated with the Ministry of Internal Affairs (MAI) of Romania. The system addresses the need for reliable, long-term covert audio-video monitoring in challenging environments (distances ≈2 m, harsh installation conditions, limited accessibility, no requirement for court-admissible evidence). Key hardware features include a compact single-board computer platform with support for analog (RCA) and optional Full-HD digital cameras, wired microphones (with best-effort exploration of wireless alternatives), a 4G/5G cellular modem for encrypted live streaming, flexible power supply (230 V AC mains, 12 V DC vehicle, 5 V auxiliary with optional power-bank backup), surge immunity, passive cooling, and remote health monitoring (input voltage, temperature, signal strength). Automatic graceful degradation mechanisms (resolution/framerate reduction, fallback to 4G or audio-only mode) ensure operational continuity under adverse conditions, while a hardware watchdog provides reliable restart capability. The software architecture enables continuous encrypted transmission of the audio-video stream to a remote server without local storage, automatic segmentation into ≈30-minute files with descriptive naming, on-demand playback, and real-time watermarking (camera identifier + timestamp). Feasibility studies are underway for audio extraction from video streams and speech-to-text transcription. The first functional prototype based on Raspberry Pi 5, an analog camera, and a 4G modem has been successfully demonstrated in May 2025, validating end-to-end live capture, transmission, reception, and segmented storage. Subsequent iterations focus on replacing active cooling with fully passive solutions, optimizing power consumption, and finalizing lightweight encryption/APN-private communication schemes. The resulting system offers a cost-effective, rapidly deployable, and resilient platform for authorized national-security surveillance operations, with potential extensions to other law-enforcement and intelligence scenarios.

ABSTRACT

This study aimed to develop and characterize a functional whey-based beverage, utilizing whey -a nutrient-rich byproduct of the dairy industry-and mango pulp to create a refreshing drink that minimizes milk wastage and provides added nutritional value. Lemon was incorporated for enhanced flavor, while castor sugar was used as a natural sweetener, with no artificial additives. Three beverage formulations varying in whey and mango content were prepared and evaluated for physical, chemical, biological, and sensory properties using standard AOAC methodologies. The produced beverage exhibited a vibrant yellow-orange color, smooth mouthfeel, and stable consistency due to the inclusion of mango pulp, nata de coco, and xanthan gum. Analytical results demonstrated that the beverage is a good source of protein, minerals (such as calcium,

potassium, phosphorus, and magnesium), and dietary fiber, with pH between 3.5-4.5 ensuring microbial safety and shelf-life stability. Sensory analysis by a trained panel indicated that consumer acceptability of the beverage was high across all tested attributes - including color, aroma, viscosity, sweetness, and overall acceptance - with the most balanced formulation containing intermediate ratios of whey and mango pulp. The findings establish that the developed whey-mango drink is not only a sustainable solution for whey utilization but also a nutritious, stable, and organoleptically pleasing functional beverage suitable for health-conscious consumers.

Keywords: whey utilization, functional beverage, mango drink, sustainability, sensory quality

ABSTRACT

The creation of multifunctional biodegradable films with colorimetric, antibacterial, and antioxidant qualities is shown in this work as sustainable materials for active packaging. The anthocyanin fraction of *Hibiscus sabdariffa*, the fatty oil of *Opuntia ficus-indica*, and the essential oil of *Salvia officinalis* were plant-derived extracts that were added to the natural polymers xanthan and chitosan used to build the biofilms. While GC-MS verified the presence of key fatty acids, including linoleic and palmitic acids and terpenoids like α-caryophyllene and β-caryophyllene, phytochemical investigations using HPLC-DAD revealed significant phenolic compounds, primarily 3-hydroxytyrosol, vanillic acid, and 4-hydroxybenzoic acid. While UV-Vis measurements showed effective light-barrier efficacy and reversible colour changes associated with anthocyanin reactivity, FTIR spectra revealed strong molecular interactions

within the biopolymer matrix. With MBC/MFC values below 250 µg/mL against tested bacteria, the films demonstrated strong antimicrobial action and good antioxidant capacity. Their environmental compatibility was confirmed by biodegradability tests, which showed a quick and thorough breakdown. Anthocyanin-based films colorimetric transition under varying pH and storage conditions demonstrated their potential as intelligent freshness indicators. This collaborative project advances the development of renewable active materials for smart packaging technologies by combining phytochemical profiling, materials engineering, and sustainable design to create repeatable, environmentally friendly biofilms with dual functional and aesthetic roles.

Keywords: Degradable biofilms; Xanthan; Chitosan; Plant extracts; Antioxidant effects; Antimicrobial properties.

ABSTRACT

Spam attacks are constantly changing on digital communication platforms. They often use multiple languages and channels to get around traditional filtering systems. This paper presents GuardNex, a system that detects spam across multiple channels and languages. It can identify spam in English, Spanish, and Bangla in text messages, emails, and WhatsApp communications. GuardNex uses a simple but effective machine learning workflow. It first applies TF-IDF to turn text into meaningful numerical features and then uses a Naive Bayes classifier to make predictions. This model is selected because it runs fast, scales well with large datasets and performs reliably with text that has many features. To ensure realistic performance the system is trained and evaluated on multilingual datasets that include different writing styles, informal language and message patterns from various communication platforms. Experimental results indicate that GuardNex achieves about 92% accuracy. It performs as well as or better than similar systems mentioned in existing studies. The results show that lightweight models paired with optimized preprocessing and multilingual representation can effectively detect spam across various communication channels. GuardNex provides a practical and flexible framework for organizations that need dependable and language-inclusive spam protection.

ABSTRACT

In recent years thin films (TF) technology has shown remarkable progress in the discovery of new materials including nano and bio based materials, magnetic materials, etc. [1]. Among them, semiconductor TF are particularly significant due to their electrical and optical properties, which make them essential in modern optoelectronic device applications[2].The prime goal of the present research is to investigate the effect of deposition time (DT) on the structural and optical properties of copper sulfide thin films (CSTF). DT dependent CSTF were synthesized onto glass substrates via the chemical bath deposition (CBD) method. X-ray diffraction (XRD) analysis confirmed the CSTF are polycrystalline in nature with hexagonal structure. From FTIR spectra it is noticed that the absorption peaks at 580 cm^{-1} is assigned to Cu–S stretching vibration, confirming the formation of CSTF. The UV-Vis spectroscopic analysis revealed that the absorbance increased with longer DT in the UV region while it decreased with increasing wavelength in the visible region. The maximum absorbance was observed for 100 min deposited CSTF. Transmittance, *T%* inversely correlated with absorbance. Moreover, the refractive index enriched with DT, attaining a maximum of approximately 2.2. The band gap energy values were found within the range 2.66-2.09 eV for CSTF at diverse DT. Urbach energy declined from 3.41 to 1.93 eV with higher DT. Additionally, the alteration of other optical parameters due to DT, such as extinction coefficient, absorption coefficient, skin depth, real dielectric constant, steepness parameter, etc., was also discussed for these CSTF.

ABSTRACT
Plants rich in bioactive compounds have the potential for widespread use in food, cosmetics, pharmaceuticals, and phytotherapeutics thanks to their bioactive compounds. Among these plants, *Stevia rebaudiana* Bertoni stands out for its natural sweetening properties and rich phytochemical content. Its leaves contain steviol glycosides, which are 100–300 times sweeter than sucrose, and are also rich in flavonoids and phenolic compounds. These compounds prevent cellular damage caused by oxidative stress by neutralizing free radicals and offer a protective effect against degenerative diseases. In this study, the bioactive compound profile and antioxidant capacity of the extract obtained from *Stevia rebaudiana* Bertoni leaves were evaluated. Extraction was carried out using an ultrasonic probe-assisted homogenizer to maximize the extraction of active compounds. The antioxidant activity of the obtained extract was determined using the Trolox Equivalent Antioxidant Capacity (TEAC) method based on the ABTS (2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)) radical cation, and a new HPLC-DAD method was developed and validated for the simultaneous determination of protocatechuic acid, catechin, gentisic acid, polydatin, p-coumaric acid, coumarin, resveratrol, quercetin, and rebaudioside A. The method showed high linearity ($R^2 = 1$), and the LOD and LOQ values of the compounds were found to be 0.02–19.25 ng/mL and 0.08–64.17 ng/mL, respectively. The compound detected at the highest concentration was rebaudioside A (345.808 µg/mg), followed by resveratrol (4.684 µg/mg), p-coumaric acid (0.341 µg/mg), and polydatin (0.219 µg/mg). The IC_{50} value of *Stevia rebaudiana* Bertoni was determined as 1589.688 mg/mL according to the ABTS method. In conclusion, the combined application of the developed and validated HPLC-DAD method and ABTS analysis enabled a comprehensive evaluation of the bioactive compound profile and antioxidant capacity of *Stevia rebaudiana* Bertoni. The obtained findings demonstrate that this plant is not only a natural sweetener but also a phytochemically valuable potential source of functional food and health-supporting ingredients.

ORCID: 0000-0001-9739-754X

ABSTRACT

With the discovery of neutrino oscillations it has become certain that at least two of the three neutrinos must be massive, albeit with masses 8.7×10^{-3} and 5.0×10^{-2} eV in normal ordering or 4.9×10^{-2} eV for both in inverted ordering much smaller compared to the other matter fields of the Standard Model. The precise nature of the mass is still elusive, though, that is, whether neutrinos are Majorana or Dirac. The simplest, although not predictive, possibility in non-supersymmetric SU(5) grand unified theories corresponds to adding at least two right-handed singlets, $\mathbf{1}_F$, which results in Dirac neutrinos. There are only three other mechanisms of mass generation at tree level and they all lead to Majorana neutrinos. In the first two Standard Model matter fields are extended by two fermionic representations that comprise either a Standard Model singlet or a weak triplet multiplet. These are dubbed Type-I and Type-III seesaw, respectively. As the name implies, these two mechanisms tie the smallness of the neutrino mass to the large mass of the hypothetical fermions which is roughly of order $10^{13} - 10^{15}$ GeV. The adjoint, i.e., $\mathbf{24}_F$, and $\mathbf{75}_F$ are the smallest representations that are appropriate for this purpose. The last mechanism called Type-II seesaw augments the Standard Model particle content by weak triplet scalars. $\mathbf{15}_S$ contains precisely such a multiplet. These are not the only possibilities though, as the neutrino masses could owe their smallness to their radiative origin. In this case, the numerical factors that appear in a loop calculation lead to a small mass for the neutrino. This can be accomplished through the use of a $\mathbf{10}_S$ as was demonstrated recently.

ABSTRACT

In this work, novel *porphyrin–indazole hybrid* compounds were synthesized via a Knoevenagel condensation between meso-substituted porphyrin aldehydes and N-substituted nitro-indazolyl acetonitriles [1]. The resulting conjugates were isolated in moderate to good yields (≈ 30–60 %) and fully characterized by a combination of spectroscopic methods (^{1}H NMR, UV–Vis, mass spectrometry) and photophysical studies. Upon visible-light irradiation, these hybrids demonstrated efficient generation of singlet oxygen ($^1O_2$), confirming their capacity as photosensitizers [2]. Their antimicrobial photodynamic therapy (aPDT) performance was evaluated in vitro against *Staphylococcus aureus*, including methicillin-resistant strains (MRSA). The porphyrin–indazole hybrids showed a significant photoinactivation effect, which was further potentiated by the addition of potassium iodide (KI), suggesting a synergistic enhancement of reactive iodine species. One of the most promising derivatives achieved a substantial log-reduction in bacterial viability under light exposure, with minimal dark toxicity. These results highlight the potential of porphyrin–indazole conjugates as effective photosensitizers for antimicrobial applications, especially in the context of resistant bacterial strains [3].

ABSTRACT
Mushrooms especially the Pleurotus species have a significant nutritional and medicinal properties reason for their gained attention. Being nutritionally rich as in proteins, vitamins (B-complex, C and D), fiber and bioactive compounds like polysaccharides, lipids, triterpenoids and lectins that contribute their role as antimicrobial, antioxidant and cholesterol-lowering effects. They have been studied extensively for their potential role as cardiovascular health regulator, particularly in lowering the cholesterol levels and mitigating the risks of cardiovascular disease. Due to the presence of β-glucans and lovastanin these has been linked to lipid regulation, anti-inflammatory and immune system enhancement, making them a successful nutraceuticals. Along with these their cultivation on different agricultural waste substrates presents them as environmentally sustainable approach. This review focuses on the nutritional composition, therapeutic applications and cultivation methods of oyster mushrooms emphasizing their ability as functional food in prevention of cardiovascular diseases and overall human health improvement.

ABSTRACT

Machine learning (ML) has rapidly emerged as a transformative tool for predicting quantum states in simple quantum systems, addressing key challenges in quantum information science. Traditional quantum state characterization methods, such as full quantum state tomography, are resource-intensive and scale poorly with system size. Recent advances demonstrate that ML approaches—including neural networks, regression models, and hybrid quantum-classical algorithms—can efficiently reconstruct, classify, and predict properties of quantum states using limited or incomplete measurement data. Neural networks have been successfully trained to classify quantum states, estimate fidelity, and identify entanglement, often requiring significantly fewer measurements than conventional techniques. Deep autoregressive models and quantum convolutional neural networks further enhance the expressive power and scalability of these methods, enabling accurate simulation and recognition of many-body quantum states. Additionally, ML-assisted Bayesian estimation and dimension-adaptive learning frameworks offer robust solutions for state reconstruction and system identification, even when the system's dimensionality is not precisely known. Physics-informed neural networks and regression on quantum computers have also shown promise in predicting ground state energies and other continuous properties with high accuracy. Collectively, these developments highlight the potential of machine learning to accelerate quantum state prediction, reduce experimental overhead, and provide new insights into the structure and dynamics of quantum systems. This abstract reviews the state-of-the-art ML methodologies for quantum state prediction, discusses their advantages over traditional approaches, and outlines future directions for integrating machine learning into quantum technologies and experimental protocols.

ABSTRACT

Anatase TiO_2 is an oxide that has been extensively studied due to its importance in photocatalysis and optoelectronic devices. In order to shed light on its structural and electronic behavior, calculations based on fundamental principles were performed using the CASTEP code within the plane wave pseudopotential framework. The Perdew-Burke-Ernzerhof form of the generalized gradient approximation was applied, along with ultrasoft pseudopotentials. As GGA generally underestimates the band gaps in correlated systems, a Hubbard correction was introduced to improve the description of the 3d states of titanium. The Hubbard parameter U was adjusted between 0 and 13 eV in order to reproduce the experimental electronic band gap. The calculated band gap increased steadily up to U = 10 eV before decreasing at higher values. The closest match to the reported experimental band gap of 3.2 eV was obtained at U = 9 eV, for which the calculated band gap reached 3.198 eV.

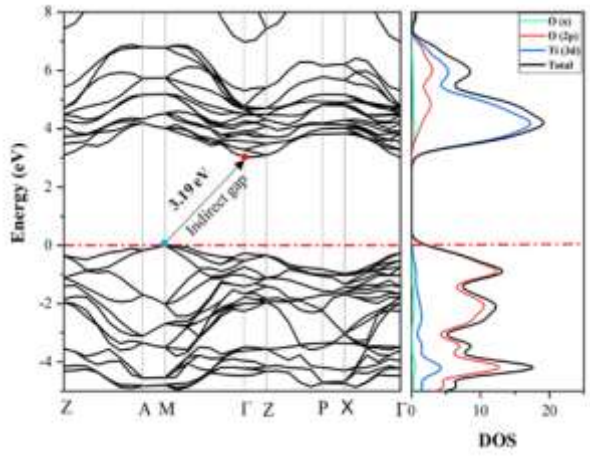

Fig. Band structure and DOS of anatase TiO_2

The Geometric optimization engendered lattice constants a = b = 3.776 Å and c = 9.486 Å, with deviations of less than 1% from experimental values. In addition, the optimized Ti–O apical bond-length ratio (u = dap/c) aligned well with earlier theoretical and experimental studies, confirming the reliability of the computational setup. The electronic band structure indicated an indirect bandgap, consistent with the arrangement of states in anatase. Furthermore, the density of states made it clear that the valence band was dominated by O 2p orbitals, while the conduction band was mainly formed by Ti 3d states.

These findings show that the structure and optoelectronic response of anatase TiO_2 could be accurately described using a calibrated GGA+U method. The improved U parameter offers precise predictions and provides a strong foundation for additional computational research on photocatalysis and advanced optoelectronic applications.

ABSTRACT

Pharmaceutical treatment protocols or combination therapies based on chemical compounds make it possible to target cancer cells, which can be complicated by several factors, including their resistance to bioactive compounds and the potential for drugs to damage certain healthy cells. This project was designed to assess the structural relationship between new dihydropteridone-derived compounds bearing an oxadiazole moiety and their corresponding cytotoxicity against breast cancer, using computational chemistry tools. The aim of this research is to better understand how compound properties influence their activity and to understand the underlying mechanisms, which could then be integrated into the anticancer drug design process with a view to recommending new optimized compounds likely to have the desired activity. The results show that the predicted molecules possess enhanced selective cytotoxic inhibitory activity against breast cancer cells (MCF-7). Guided by these analyses, we designed five novel dihydropteridone derivatives incorporating an oxadiazole moiety. These compounds exhibited favorable interactions with key breast cancer-related proteins, demonstrated enhanced dynamic stability within their binding sites, and adhered to established drug-likeness principles. Importantly, these compounds displayed promising oral absorption (88%) in preliminary assessments and exhibited no significant toxicity. These findings suggest that these novel dihydropteridone-oxadiazole derivatives warrant further investigation as potential multifunctional agents for the treatment of breast cancer cells (MCF-7).

Keywords: QSAR, novel dihydropteridone derivatives, Molecular docking, oxadiazole, Molecular dynamics, ADMET propriety, MCF-7, Breast cancer cells.

GEOSPATIAL MODELING OF URBAN FLOOD VULNERABILITY IN DHAKA CITY: AN INTEGRATED REMOTE SENSING, GIS, AND AHP-FUZZY SMCE APPROACH

Swarnali Akter*

Department of Geography and Environmental Studies University of Rajshahi, Rajshahi

***Corresponding author email: s.shorna202@gmail.com

ABSTRACT

The severity of floods has increased in recent years, especially in urban areas, and they pose significant threats to infrastructure, human life, and the environment. Increased urbanization, destruction of forests, and climate change are the main causes of these escalated situations, highlighting the necessity of appropriate disaster risk reduction measures. To address these issues, this study integrates the Analytic Hierarchy Process (AHP), Fuzzy Logic Model, Spatial Multi-Criteria Evaluation (SMCE) Method, and Geoinformation Technology to provide an enhanced methodological approach for flood vulnerability assessment in Dhaka, Bangladesh. Integrating these approaches provides a systematic and thorough framework for evaluating flood vulnerability by incorporating spatial analysis, uncertainty modeling, and decision-making procedures. To identify high-risk flood-prone areas, Geographic Information Systems (GIS) are essential to this study because it makes it easier to integrate, analyze, and visualize spatial data layers. The AHP method ensures a methodical and quantitative approach to decision-making by determining the relative importance of fifteen specified flood susceptibility factors. The Fuzzy Logic Model uses fuzzy linear membership functions to convert the input variables into fuzzy sets, which tackles the inherent ambiguity and uncertainty related to flood vulnerability. The flood vulnerability assessment becomes more accurate by this fuzzification process. After that, a thorough flood vulnerability map is created using the weighted sum overlay technique, which captures regional variations in risk levels. According to the study's findings, about 9%, 21%, and 29% of the entire study area are classified as being in extremely high, high, and moderate vulnerability zones, respectively. This suggests that almost 60% of Dhaka is at high risk of flooding. Kamrangirchar and Khilgaon have been selected as the most vulnerable regions due to the presence of highly high-vulnerability areas throughout their areas. The study utilizes an accuracy assessment and computes the overall accuracy, user accuracy, producer accuracy and kappa coefficient value to verify the model's reliability, and it achieved an overall accuracy score for reliability of 88%. This validation demonstrates an excellent level of accuracy in evaluating flood vulnerability, confirming the robustness of the combined approach. Based on the findings, a strategic management plan has been developed to address the flooding threats in the area. Given that the modeling approach integrates remote sensing data, GIS, and AHP-Fuzzy SMCE techniques, it has the potential to be adapted for use in other urban areas, both within the country and internationally, with some localized adjustments. Stakeholders and government officials can reduce the risk of flooding and improve urban resilience by utilizing the synergies of AHP, Fuzzy Logic, SMCE, and GIS. This strategy's multidisciplinary nature highlights its potential for tackling intricate flood threats and promoting long-term disaster risk reduction projects.

CLIMATE CHANGE AND ANTHROPOGENIC WATERLOGGING: SMALL FARMERS' VULNERABILITY TO FOOD SECURITY IN BARIND AREA OF BANGLADESH

Razia Sultana Ruba

Dept. of Agronomy and Agricultural Extension, University of Rajshahi, Rajshahi-6205, Bangladesh.

Corresponding author Email: s2212366153@ru.ac.bd

ABSTRACT

The Barind region of Bangladesh is increasingly affected by the combined impacts of climate change and human-induced water management challenges, which significantly threaten agricultural livelihoods and food security. Smallholder farmers in this drought-prone area have experienced rising temperatures, erratic rainfall, and prolonged dry spells, which disrupt traditional cropping patterns. At the same time, poorly planned infrastructure—such as blocked culverts, roads, and drainage near settlements and institutional areas—prevents natural water flow, causing localized waterlogging even after moderate rainfall. This dual pressure of climatic stress and anthropogenic waterlogging disrupts crop establishment, delays planting, increases production costs, and reduces yields of key crops. The aim of this study is to assess how climate variability and anthropogenic waterlogging interact to heighten vulnerability among small farmers. Data were collected through household surveys, focus group discussions, and field observations across selected Barind villages. Findings show that these combined pressures reduce crop yields, delay planting, and increase food insecurity. Limited adaptive capacity – due to low income, weak institutional support, and restricted access to climate-smart technologies – further intensifies food insecurity risks. Strengthening water management system, improving drainage infrastructure, and promoting adaptation strategies are essential to reduce vulnerability, enhance resilience and secure food production in the Barind region.

Keywords: Climate change, anthropogenic waterlogging, small farmers, food security, agriculture, Barind region, Bangladesh.

ABSTRACT

Olive mill wastewater (OMW) poses a significant environmental challenge due to its high organic and phenolic content. This study explored the use of activated carbon (AC) derived from olive mill solid waste (OMS) as an adsorbent for removing phenolic compounds (PCs) from OMW. The preparation of AC was optimized using response surface methodology (RSM), focusing on activating agents (KOH, $ZnCl_2$, and H_3PO_4), activation temperatures (600–800°C), and impregnation ratios (2–4). Results revealed that $ZnCl_2$ was the most effective activating agent, producing the highest iodine number of AC. The optimal conditions for $ZnCl_2$-activated carbon (ACZ) were achieved at 700°C with a 4:1 impregnation ratio. The ACZ and raw OMS were characterized using TG/DTG, ATR-FTIR, SEM, and XRD analyses. Batch adsorption experiments were conducted to assess the removal of PCs from OMW, examining factors such as pH, contact time, adsorbent dose, initial polyphenol concentration, and temperature. The adsorption data aligned well with the Langmuir isotherm model ($R^2 = 0.990$) and the pseudo-second-order kinetic model ($R^2 = 0.990$), suggesting chemisorption as the primary mechanism. Desorption studies using hydrochloric acid (HCl) recovered 68% of adsorbed PCs in the first cycle and 20% in the second cycle.

ABSTRACT

This study provides an attempt to analyze the behaviors of materials in structures when the material deflection is chosen as Gaussian-type functions. By taking the Gaussian-type material deflection into account, the related parameters that occur accordingly have been expressed in terms of the Hermite polynomials. Particularly, by using the Rodrigues' type formula, it has been indicated that there exist relationships of the Hermite polynomials with the governing differential equations of materials. Overall, this study reveals the usability of the Rodrigues' type formula of the Hermite polynomials and other special polynomials for mathematically modeling the deflection on materials.

Keywords: Computational analysis, Deflection of Materials, Gaussian function, Hermite polynomials, Structural member.

1 Introduction, Definitions and Preliminaries

Materials are used to manufacture beams which can be briefly defined as horizontal structural elements carrying vertical loads in civil engineering. Different deflections on these types of materials that one may encounter in the application need to be modeled in some way. In this context, the effects of the load imposed on the materials by selecting the deflection of the materials as different kind of functions have been investigated for years by some researchers, and formulas have been developed for these effects; for examples (among others), see (Alderliesten 2018, Alderliesten 2025, Kocatürk et al. 2010, Shukur et al 2023, Tuan Ya et al. 2019); and also see the references cited therein.

As for the main purpose of the present study, it is two-fold: First is to provide an attempt to analyze how the materials behave when their deflection is chosen as Gaussian-type functions. Second is to investigate the relationships of the material-governing equations with the Hermite polynomials.

Below, we begin by recalling the notations and definitions necessary to achieve the main aim of this study.

Let E, I, w and q denote the modulus of elasticity, the moment of inertia (or second moment) of a plane area, the deflection of the material (in the z direction at some position x) and the intensity of distributed load (force per unit length), respectively. Then, the Euler–Bernoulli equation is given by

$$\frac{d^2}{dx^2}\left(EI\frac{d^2w}{dx^2}\right) = q,$$

which describes the relationship between the functions w and q for the case when the product EI (known as the flexural rigidity) differ depending on the values of x (Gere and Timoshenko 1997).

Let V, M and θ denote the shear force, the bending moment and the slope in the material. Then, in the case when the flexural rigidity EI is a constant with the intensity of distributed load q applied downwards, the material-governing equations are given by the following differential equations (Gere and Goodno 2008):

$$EI\frac{dw}{dx} = \theta,$$

$$EI\frac{d^2w}{dx^2} = M,$$

$$EI\frac{d^3w}{dx^3} = V$$

and

$$EI\frac{d^4w}{dx^4} = q.$$

Note that in the above equations, the sign of the distributed load is not considered since it is assumed that the load is applied downwards.

As for the Hermite polynomials, they constitute a sequence of orthogonal polynomials possessing a remarkable role in a wide range of fields from mathematics to engineering and physics. In the literature, these polynomials are available in principal forms, which are the

physicist's Hermite polynomials $H_n(x)$ and the probabilist's Hermite polynomials $He_n(x)$. The physicists' Hermite polynomials arise particularly in solving some kinds of differential equations and in the solutions of the simple harmonic oscillator of quantum mechanics, while the probabilists' Hermite polynomials are used primarily in probability theory and statistics. See, for details, (Rainville 1960, Arfken and Weber 2005, Koornwinder et al. 2010, Abramowitz and Stegun 1972, Wikipedia 2005a); and also see the references cited therein. Moreover, in the literature, there are another kind of polynomials called Hermitian polynomials arising from the Hermite interpolation, and there are a few studies that associate some structural elements with the Hermitian polynomials for their finite element formulation and generate Hermitian shape functions for the analysis of the structural elements using the finite element method; for details and examples (among others), refer to (Augarde 1998).

The Rodrigues's formula for the physicist's Hermite polynomials is given by:

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} \tag{1}$$

and the relation between the physicist's and the probabilist's Hermite polynomials are given as below:

$$He_n(x) = 2^{-\frac{n}{2}} H_n\left(-\frac{x}{\sqrt{2}}\right), \tag{2}$$

(Abramowitz and Stegun 1972, Koornwinder et al. 2010, Weisstein 2005).

Note that the probabilist's Hermite polynomials are monic polynomials, and some of their values are listed below:

$$He_0(x) = 1,$$
$$He_1(x) = x,$$
$$He_2(x) = x^2 - 1,$$
$$He_3(x) = x^3 - 3x,$$
$$He_4(x) = x^4 - 6x^2 + 3,$$

and so on (Abramowitz and Stegun 1972, Koornwinder et al. 2010, Weisstein 2005).

The Gaussian function is given in the following form:

$$f(x) = e^{-x^2},$$

which is frequently used to represent the probability density function of the normal (Gaussian) distribution:

$$f(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}},$$

where μ denotes the mean (or expectation) of the distribution and σ^2 denotes the variance (while σ is the standard deviation of the distribution such that $\sigma \geq 0$). In the special case when $\mu = 0$ and $\sigma^2 = 1$, the probability density function reduces to

$$f(x, 0, 1) = \frac{e^{-\frac{x^2}{2}}}{\sqrt{2\pi}},$$

see, for details, (Squires 2012, Wikipedia 2005b); and also see the references cited therein.

Gaussian functions are extensively utilized across various fields. In statistics, they are key to describing normal distributions. In signal processing, they form the basis for Gaussian filters. Image processing uses two-dimensional Gaussians for effects like Gaussian blurs. Furthermore, in mathematics, they play a crucial role in solving heat and diffusion equations and in defining the Weierstrass transform. See, for details, (Squires 2012, Wikipedia 2005b); and also see the references cited therein.

Among others, the most interesting mathematical property of the function $f(x,\mu,\sigma)$ is that the derivatives of the Gaussian function can be expressed using the Hermite polynomials. Indeed, if x is replaced by $\frac{x-\mu}{\sigma\sqrt{2}}$ in the Rodrigues's formula, given by (1), for the Hermite polynomials, then the following relation is obtained:

$$H_n\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) = (-\sigma\sqrt{2})^n e^{\frac{(x-\mu)^2}{2\sigma^2}} \frac{d^n}{dx^n} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, \tag{3}$$

see, for details, (Romeny, 2003).

2 Main Results

In this section, the main findings of this study are given. Especially, relationships of the material-governing equations with the Hermite polynomials have been investigated.

Because of Rodrigues's formula, given by (1), for the Hermite polynomials and due to the equation (3), when the material's deflection is selected as

$$w(x,\mu,\sigma) := f(x,\mu,\sigma) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}},$$

the material-governing equations can be rewritten in terms of the physicist's Hermite polynomials as follows:

$$\theta = EI\frac{d}{dx}\{w(x,\mu,\sigma)\} = -\frac{EI}{\sigma\sqrt{2}} H_1\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) w(x,\mu,\sigma),$$

$$M = EI\frac{d^2}{dx^2}\{w(x,\mu,\sigma)\} = \frac{EI}{2\sigma^2} H_2\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) w(x,\mu,\sigma),$$

$$V = EI\frac{d^3}{dx^3}\{w(x,\mu,\sigma)\} = -\frac{EI}{2\sqrt{2}\sigma^3} H_3\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) w(x,\mu,\sigma)$$

and

$$q = EI\frac{d^4}{dx^4}\{w(x,\mu,\sigma)\} = \frac{EI}{4\sigma^4} H_4\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) w(x,\mu,\sigma).$$

By using the relation, given by the equation (2), between the physicist's and the probabilist's Hermite polynomials, the other representations of the above material-governing equations have been obtained in the manner of the probabilist's Hermite polynomials as follows:

$$\theta = EI\frac{d}{dx}\{w(x,\mu,\sigma)\} = -\frac{EI}{\sigma} He_1\left(-\frac{x-\mu}{\sigma}\right) w(x,\mu,\sigma),$$

$$M = EI\frac{d^2}{dx^2}\{w(x,\mu,\sigma)\} = \frac{EI}{\sigma^2} He_2\left(-\frac{x-\mu}{\sigma}\right) w(x,\mu,\sigma),$$

$$V = EI\frac{d^3}{dx^3}\{w(x,\mu,\sigma)\} = -\frac{EI}{\sigma^3}He_3\left(-\frac{x-\mu}{\sigma}\right)w(x,\mu,\sigma)$$

and

$$q = EI\frac{d^4}{dx^4}\{w(x,\mu,\sigma)\} = \frac{EI}{\sigma^4}He_4\left(-\frac{x-\mu}{\sigma}\right)w(x,\mu,\sigma).$$

In the special case when $\mu = 0$ and $\sigma^2 = 1$, the above equations give us the following formulas:

$$\theta = -EIHe_1(-x)\frac{e^{-\frac{x^2}{2}}}{\sqrt{2\pi}} = \frac{xe^{-\frac{x^2}{2}}EI}{\sqrt{2\pi}},$$

$$M = EIHe_2(-x)\frac{e^{-\frac{x^2}{2}}}{\sqrt{2\pi}} = \frac{e^{-\frac{x^2}{2}}(x^2-1)EI}{\sqrt{2\pi}},$$

$$V = -EIHe_3(-x)\frac{e^{-\frac{x^2}{2}}}{\sqrt{2\pi}} = \frac{e^{-\frac{x^2}{2}}(x^3-3x)EI}{\sqrt{2\pi}}$$

and

$$q = EIHe_4(-x)\frac{e^{-\frac{x^2}{2}}}{\sqrt{2\pi}} = \frac{e^{-\frac{x^2}{2}}(x^4-6x^2+3)EI}{\sqrt{2\pi}}.$$

which are valid for the case when the function of materials' deflection is selected as

$$w(x,0,1) := f(x,0,1) = \frac{e^{-\frac{x^2}{2}}}{\sqrt{2\pi}}.$$

3 Conclusion

In line with the findings of this study, the following conclusions have been drawn:

In order to evaluate structural elements during the design phase of reverse engineering, it is necessary to know how they respond to different types of exposure. As is well known, different types of elements serving the same purpose may be subjected to different types of loads. The difficulties in calculations that take certain loading patterns into account and the fact that the calculations provide approximate values rather than precise and accurate values hinder the behavior of the elements from being clearly and accurately reflected in the designs. Therefore, the attempts described in the paper may help to overcome such shortcomings.

ABSTRACT

This study investigates the effects of gamma irradiation on the physical–mechanical properties of mortars modified with styrene–acrylic ester (SAE) polymers. Prism specimens were produced at w/c=0.50 using PC CEM I 42.5R cement and crushed sand. Two SAE types were used at 5% and 10% replacements. After one week curing, part of the specimens was irradiated to a total gamma dose of 30 kGy. Flexural and compressive strengths were measured approximately one week after irradiation. The control sample exhibited the highest compressive strength. Increasing polymer content from 5% to 10% reduced both compressive and flexural strengths in irradiated and non-irradiated groups. Gamma irradiation generally decreased compressive strength (≈2–20%) while tending to increase flexural strength (≈4–9%). No systematic superiority was observed between STA and LIPATON. Overall, the findings suggest that gamma irradiation may enhance ductility/toughness but can limit compressive capacity in polymer-modified mortars, and that lower polymer dosages provide a more balanced mechanical response.

Keywords: Radiation shielding, polymer modified mortar, physico-mechanical properties

1 Introduction

Polymer-modified cement concrete or mortar is produced by mixing polymer dispersions, redispersible powders, water-soluble polymers, or liquid polymers with the fresh mix. Monomers can even be added to the mix, assuming polymerization and adequate film formation occur along with the cement hydration process (Mirza et al. 2002). In modern concrete production, composites produced using polymers together with cement and aggregates are called polymer-modified concrete, while composites made with polymers and aggregates are called polymer mortar (PM) or polymer concrete (PC). In this context, the performance of cementitious materials can be improved by adding particles small enough to fill the voids between cement particles.

Polymers have been used as additives and modifiers for cement-based materials such as mortar and concrete (Orange et al. 2007). The property development in mortar and concrete through polymer modification is related to the effect of the polymer on the material as a result of its incorporation into the material structure, cement hydration, porosity, and unit water content (Svegl et al. 2008). As a result, the chemical and physical interactions between polymers and cement hydrates significantly improve the strength, adhesion, resilience, impermeability, chemical resistance, and durability properties of mortar and concrete (Ohama 1987). These materials are suitable for use in various structural and non-structural precast products, such as tile adhesives, facade cladding, flooring, decorative coatings, and as repair materials in road buildings (Hwang and Young 2008).

Styrene-acrylic ester copolymer (SAE) plays an important role in the family of acrylic polymers used in cement mortars. When a suitable SAE emulsion is added to cement, the dynamic modulus of elasticity decreases with an increase in the SAE/cement ratio. Specific damping capacity, impact resistance, and abrasion resistance increase with an increase in the SAE/cement ratio. SAE-modified mortars exhibit the best dynamic behavior when the added polymer content is between 15-20% (Wong et al. 2003).

A minimum polymer/cement ratio of 5% is generally assumed to be necessary to ensure adequate film formation in mortar modified with polymer dispersions. Polymer film or polymer bridge formation is achieved in mortar modified with 10 to 15% styrene-acrylic ester (SAE) dispersion (Janotka et al. 1996). Film thickness and permeability to water molecules depend primarily on the type and percentage of polymer used. Strength reaches a maximum value around 5% and then gradually decreases.

The aim of this study is to investigate the effects of gamma ray exposure on the physical-mechanical properties of cement mortars modified with SAE at different ratios and to observe the differences that may occur with varying parameters such as gamma ray dose, w/c ratio, aggregate, and polymer type. Irradiation doses up to 50 kGy will be applied to minimize deterioration and maximize cross-linking. The morphological and thermal properties of the samples will also be examined to determine the effect of changing the dose on changes in material structure. Depending on all these, an optimization study and profit/cost analysis will also be carried out for the new material to be produced by evaluating the data obtained as a result of tests to be carried out in accordance with the standards in the building materials laboratory.

2 Materials and Methods

The volumetric mix designs of the mortar samples were prepared so that the cement, water, and aggregate amounts remained constant and that the mixture would fill 40 x 40 x 160 mm prism molds. For one prism sample, 145.2 dm^3 of cement, 225.0 dm^3 of water, and 629.8 dm^3 of

aggregate (crushed sand) were used. For this purpose, two separate sample groups were produced for two different styrene acrylic ester (SAE) polymer types, STA and LIPATON, with a w/c ratio of 0.5 and cement substitution rates of 5% and 10%. Table 1, showing the samples prepared for the test and their properties, is given below.

Table 1: Types of samples propered in the laboratory and some of their properties

Sample type	Properties
Cement	PC CEM I 42.5R, d=3.1 g/cm^3
Aggregate	Crushed sand (waited in a laboratory environment, sieved through a 4 mm sieve, 2.08% water absorption, d = 2.68 g/cm^3)
STA	Solid content 57%, pH=7.85, Tg=-10 °C, d=1.04 g/cm^3
LIPATON	solid content 47%, pH=10.00, Tg=-8 °C, d=1.02 g/cm^3

After the samples were poured into the molds, they were removed 24 hours later and left to cure in a water tank. After nearly one week of curing, some of the samples were stored in the laboratory before being carefully packaged and sent to GAMMA-PAK for irradiation.

The samples, irradiated to a total dose of 30 kGy, were subjected to flexural and compressive strength tests approximately one week after irradiation.

3 Results and Discussion

The results of the compressive and flexural strength tests are given in Table 2.

Table 2: Experimental values of the compressive and flexural strength

Sample code	Compressive Strength (MPa)	Flexural Strength (MPa)
STA 5%	43,56	7,45
STA 10%	33,88	6,90
LIPATON 5%	44,20	6,92
LIPATON 10%	36,56	6,79
STA 5% (irradiated)	35,02	6,66
STA 10% (irradiated)	32,95	7,16
LIPATON 5% (irradiated)	38,38	7,56
LIPATON 10% (irradiated)	31,46	7,28
CONTROL	47,62	7,34

As a result of the experiments,

- It was determined that the compressive strength value of control sample was measured higher than all of the others.

- It was observed that increasing the percentage polymer content from 5% to 10% resulted in lower flexural and compressive strength for both irradiated and non-irradiated groups compared to the control sample.
- Compressive strength values generally decreased following irradiation compared to non-irradiated samples.
- Flexural strength values generally increased following irradiation compared to non-irradiated samples.
- In light of all the data, no data pattern was detected in which polymers with different codes (STA and LIPATON) would show superiority or weakness over each other.

4 Conclusions

Studies on improving the performance of polymer-modified concrete through radiation exposure are a popular topic in the literature. In this study, it was observed that this exposure is more effective in flexural strength than in compressive strength.

In future studies, microstructural analyses will help to understand the reasons for these and similar findings, and the degree of improvement can be increased to higher levels.

ÖZET

Enerji depolama teknolojileri, günümüzde artan enerji talebi, yenilenebilir enerji kaynaklarının entegrasyonu ve mobil sistemlerin yaygınlaşması nedeniyle kritik bir öneme sahiptir. Özellikle enerji sistemlerinde süreklilik, güvenilirlik ve verimlilik konuları depolama birimlerinin karakteristiklerine doğrudan bağlıdır. Bu çalışmada süperkapasitörler ile lityum polimer (Li-Po) pillerin sabit yük altında deşarj performansları ve enerji verimliliği yönünden kapsamlı bir karşılaştırma yapılmıştır. Bu çalışmada yöntem, ayrı ayrı süperkapasitör ve lityum polimer pillerin 13.8 volt seviyesine kadar şarj edilip aynı sabit yük altında bir deney düzeneği kurularak 10,5 volta kadar deşarj analizlerinin yapılması şeklinde belirlenmiştir. Gerçekleştirilen deneylerde sabit yük altında hem süperkapasitörler hem de Li-Po pillerin gerilim-zaman eğrileri, akım-zaman eğrileri, enerji kayıpları ve verimlilikleri analiz edilmiş, iki tip enerji depolama sistemi arasındaki fark verimlilik açısından ortaya konulmuştur. Ayrıca, son yıllarda öne çıkan enerji depolama araçlarından süperkapasitör ve lityum polimer piller ile ilgili son 15 yılda yapılmış çalışmalar, araştırma konusuna katkısı bakımından incelmiştir. Sonuç olarak; süperkapasitörlerin hızlı deşarj olma ve yüksek akım verebilme özelliği net olarak ortaya çıkmıştır. Li-Po pillerin ise süperkapasitörlere nazaran daha kısıtlı akım sağladığı ve daha uzun sürede deşarj olduğu görülmüştür. Öyle ki; 60 watt güç çeken bir yük altında süperkapasitör 13,8-10,5 volt aralığında yaklaşık 1 dakikada deşarj olurken, Li-Po pil yaklaşık 15 dakikalık süre boyunca yüke enerji sağlayabilmiştir. Ayrıca, süperkapasitörlerin ani güç çeken sistemlerde daha verimli çalıştığı, Li-Po pillerin ise stabil enerji gerektiren sistemlerde daha verimli olduğu ortaya konulmuştur. Bu bulgular çerçevesinde; süperkapasitörler ile Li-Po pillerin hibrit bir sistem içerisinde birlikte kullanılması daha verimli olacaktır.

Anahtar Kelimeler: süperkapasitör, Li-Po pil, verimlilik

COMPARISON OF DISCHARGE ANALYSIS OF SUPERCAPACITOR AND LITHIUM POLYMER BATTERIES UNDER CONSTANT LOAD IN TERMS OF EFFICIENCY

ABSTRACT

Energy storage technologies have critical importance due to the increasing energy demand in recent years, integration of renewable energy sources and proliferation of mobile systems. Especially, continuity, reliability and efficiency issue in energy systems are directly dependent on the characteristics of storage units. In this study, a comprehensive comparison was made between supercapacitors and lithium polymer (Li-Po) batteries in terms of discharge performance and energy efficiency under constant load. In this study, the method was determined as charging the supercapacitor and lithium polymer batteries separately up to 13.8 volts and performing discharge analyses up to 10.5 volts by setting up an experimental setup under the same constant load. In the experiments, voltage-time graphes, current-time graphes, energy losses and efficiencies of both supercapacitors and Li-Po batteries under constant load were analyzed and the difference between the two types of energy storage systems was revealed in terms of efficiency. In addition, studies conducted in the last 15 years on supercapacitors and Li-Po batteries, were examined in terms of their contribution to the research topic. As a result, the fast discharge and high current delivery properties of supercapacitors have been clearly revealed. It has been observed that Li-Po batteries provide more limited current and take longer to discharge than supercapacitors. While the supercapacitor was discharged in the 13.8-10.5 volt range in about 1 minute under a load drawing 60 watts of power, the Li-Po battery was able to provide energy to the load for about 15 minutes. Additionally, it has been shown that supercapacitors operate more efficiently in systems that draw sudden power, while Li-Po batteries are more efficient in systems that requiring stable energy. In the context of these findings, the combined use of supercapacitors and Li-Po batteries in a hybrid system would be more efficient.

Keywords: süpercapacitor, Li-Po batteries, efficieny

1.GİRİŞ

Günümüzde nüfusun artması, küresel ekonominin büyümesi, teknolojinin gelişmesi enerji tüketiminin artmasında etkili olmaktadır (Sorrell, 2015). Uluslararası Enerji Ajansı verilerine göre, küresel enerji ihtiyacının 2050 yılına kadar %50 den fazla artacağı tahmin edilmektedir (IEA, 2022). Bu durum, sürdürülebilir ve verimli enerji kaynaklarına yönelimi arttırmakta ve enerji depolama tekniklerinin stratejik önemini ortaya koymaktadır. Bu nedenle, enerji depolama sistemleri enerji sürekliliğini sağlamak konusunda kritik bir rol üstlenmektedir (Luo at al., 2015).

Enerji depolama sistemleri arasında elektrokimyasal birimler (aküler, lityum-iyon, lityum polimer vb.) ile elektriksel depolama birimleri (süperkapasitör, manyeto-dinamik sistemler) öne çıkmaktadır (Miller&Simon, 2008; Burke, 2010). Bu bağlamda, son yıllarda **süper kapasitörler** ve **lityum polimer (Li-Po) piller**, farklı uygulamalarda yüksek performans ve uzun ömürlü enerji depolama çözümleri olarak ön plana çıkmıştır (Gopi & Ramesh, 2024).

Süper kapasitörler, klasik kondansatörler ile elektrokimyasal piller arasında konumlanan ve enerji depolama mekanizması bakımından her iki sistemin özelliklerini bir araya getiren elemanlardır. Temel olarak enerji depolama, çift katmanlı kapasitans (EDLC) veya psödokapasitans mekanizmalarıyla sağlanır (Chen, 2024). EDLC tipi süperkapasitörlerde enerji, elektrot-elektrolit ara yüzeyinde elektrostatik yük birikimiyle depolanırken; psödokapasitörlerde iyonik reaksiyonlar da sürece dâhil olur. Bu nedenle, elektrot malzemesi, yüzey alanı, gözeneklilik ve elektrolit seçimi sistemin enerji yoğunluğunu ve deşarj verimliliğini doğrudan etkilemektedir (Khan, 2025).

Lityum polimer (Li-Po) piller, yüksek enerji yoğunlukları, düşük ağırlıkları ve tasarım esneklikleri sayesinde taşınabilir elektronik cihazlardan elektrikli araçlara kadar geniş bir kullanım alanına sahiptir (Cortada-Torbellino et al., 2024). Bu piller, lityum iyon pillerle benzer prensipte çalışmakla birlikte, sıvı yerine polimer bazlı elektrolitler kullanmaları sebebiyle daha güvenli ve kompakt çözümler sunmaktadır. Ancak yüksek akım çekimi durumunda iç direnç artışı, ısınma ve kapasite düşüşü gibi verimlilik kayıpları meydana gelmektedir (Hasan, 2025).

Süperkapasitörler yüksek güç yoğunluğunda anlık enerji sağlayabilmeleri, uzun çevrim ömrü ve hızlı şarj-deşarj özellikleri ile dikkat çekerken; Li-Po piller yüksek enerji yoğunluğu, taşınabilirlik ve düşük maliyet avantajı gibi özellikleriyle öne çıkmaktadır (Conway, 1999; Chen, 2009). Süperkapasitörler; elektrikli hibrit araçlar, taşınabilir elektronik cihazlar, rüzgar ve güneş enerjisi sistemleri gibi alanlarda yoğun olarak kullanılmaktadır (Balbaşı, Şahin, 2015). Li-Po piller ise dron ve multikopter vb insansız hava araçları, ölçüm cihazları, tıbbi cihazlar, robotik ve endüstriyel sistemler gibi alanlarda oldukça yaygınlaşmaktadır (Gelen, Tüfekçioğlu, 2020; Lee et al., 2012).

Bu çalışmanın amacı, yüksek güç yoğunluğu ile öne çıkan süperkapasitörler ile yüksek enerji yoğunluğu ile dikkat çeken lityum polimer (Li-Po) pillerin sabit yük altında deşarj performanslarının deneysel yollarla analiz edilerek verimlilik açısından karşılaştırılmasıdır. Bu doğrultuda deneysel düzenek oluşturularak gerilim ve akım karakteristikleri, enerji kayıpları ve verimlilik değerleri analiz edilmiştir. Çalışma sonucunda elde edilen bulgular, enerji depolama sistemlerinin gelecekteki kullanım alanlarına rehberlik edecek ve sürdürülebilir enerji sitemlerinin kullanımı için önemli bir yol haritası oluşturacaktır.

Süperkapasitörler ile Li-Po pillerin değişken yük profilleri veya farklı sıcaklık koşulları açısından performans analizleri literatürde ayrı ayrı yer bulmuş olsa da, bu iki depolama sisteminin sabit yük altındaki deşarj performanslarının deneysel yolla karşılaştırıldığı çalışmalar sınırlı sayıdadır. Bu çalışma, süperkapasitör ve lityum polimer pillerin sabit yük

altında enerji verimliliği, güç kayıpları ve deşarj davranışlarının deneysel olarak karşılaştırılmasını hedefleyerek literatürdeki önemli bir boşluğu doldurmayı amaçlamaktadır.

Bu çalışma, enerji verimliliği odaklı sistem tasarımlarında doğru depolama teknolojisinin belirlenmesine yönelik mühendislik uygulamalarına katkı sağlayacak olması bakımından önemlidir.

Bu çalışmanın özgünlüğü, süperkapasitör ve Li-Po pillerin sabit yük altında deşarj performanslarına dayanarak verimlilik açısından bütüncül bir karşılaştırma sağlayan ve deneysel bir çerçeve sunan yaklaşımıdır.

2. MATERYAL VE METOT

Bu bölümde, süperkapasitör ve lityum polimer (Li-Po) pillerin sabit yük altında deşarj performanslarının karşılaştırılması amacıyla oluşturulan deneysel düzenek ve uygulanan yöntemler ayrıntılı biçimde açıklanmaktadır.

2.1. Deneysel Düzenek

Bu çalışmada iki farklı enerji depolama birimi incelenmiştir:

1. **Süperkapasitör grubu,**
2. **Lityum polimer (Li-Po) pil paketi.**

Her iki sistem de aynı test koşullarına tabi tutulmuş, başlangıç gerilimi **13,8 V** olacak şekilde şarj edilmiş ve sabit yük altında deşarj edilmiştir. Böylece farklı enerji depolama teknolojilerinin aynı başlangıç koşullarında enerji verimliliği açısından karşılaştırılması sağlanmıştır.

2.1.1. Süperkapasitör Sistemi

Deneyin ilk aşamasında, altı adet **500 Farad, 2.7 V** nominal değerlere sahip süperkapasitör seri olarak bağlanmıştır. Bu bağlantı sonucunda sistemin toplam kapasitesi yaklaşık **83,3 F**, toplam çalışma gerilimi ise **16,2 V** olmuştur. Her bir kapasitörün iç direnci **1,7 miliohm (mΩ)** olduğundan, sistemin toplam iç direnci yaklaşık **10,2 mΩ** olarak hesaplanmıştır.

Süperkapasitör grubu **13,8 V** gerilime kadar şarj edilmiştir. Şarj işlemi sabit akım–sabit gerilim prensibiyle gerçekleştirilmiş, hedef gerilime ulaşıldığında akım sıfıra yaklaşana kadar şarj devam ettirilmiştir.

Deşarj deneyinde, süperkapasitör grubunun çıkışına **voltaj, akım ve güç** değerlerini anlık olarak ölçebilen bir dijital veri toplama cihazı bağlanmıştır. Ölçüm cihazının ardından **60 W gücünde, 12 V halojen otomobil far ampulü** sabit yük olarak devreye alınmıştır. Ampulün sabit direnci, deşarj boyunca kapasitör geriliminin düşmesiyle birlikte akımın azalmasını doğal olarak sağlamış ve tipik bir sabit yük profili elde edilmiştir.

2.1.2. Lityum Polimer Pil Sistemi

İkinci deneysel sistem, **14,8 V – 4200 miliamper (mAh) – 40C** özelliklerine sahip bir **Li-Po pil paketi** kullanılarak oluşturulmuştur. Pilin üretici verilerine göre iç direnci **50 mΩ'**dür. Bu değer, süperkapasitör sistemine kıyasla daha yüksek olup, özellikle yüksek akım altında ısıl kayıpların oluşmasına neden olmaktadır.

Li-Po pil de süperkapasitör sistemine benzer şekilde **13,8 V** gerilime kadar şarj edilmiştir. Böylece her iki enerji kaynağı aynı başlangıç potansiyeline sahip olacak biçimde test edilmiştir.

Pil çıkışına süperkapasitör sisteminde kullanılanla aynı **voltaj, akım ve güç ölçüm cihazı** bağlanmış, ardından aynı **60 Watt halojen ampul** sabit yük olarak devreye alınmıştır. Böylece deney koşulları arasında ölçüm altyapısı ve yük açısından tam eşdeğerlik sağlanmıştır.

2.1.3. Ölçüm Koşulları ve Veri Toplama

Tüm deneyler **25 ± 1 °C** sıcaklıkta sabit ortam koşullarında gerçekleştirilmiştir. Her iki sistem 13.8 V şarj durumuna getirildikten sonra, sabit yük altında **deşarj süreci başlatılmış** ve sistem gerilimi 10,5 V seviyesinin altına düşene kadar ölçümler sürdürülmüştür.

Ölçüm cihazı, deşarj süresince **gerilim (V), akım (A), güç (W)** ve **zaman (s)** değerlerini saniyelik örnekleme aralığıyla kaydetmiştir. Toplanan veriler bilgisayar ortamına aktarılarak, enerji verimliliği, güç kayıpları ve gerilim düşüm eğrileri MATLAB ortamında analiz edilmiştir.

2.2. Verilerin Değerlendirilmesi

Deneysel veriler, hem anlık ölçümler hem de bütünleşik (integral) enerji analizi yöntemiyle değerlendirilmiştir. Süperkapasitör ve Li-Po pil sistemlerinin enerji verimlilikleri (η) aşağıdaki eşitlik yardımıyla hesaplanmıştır:

$$\eta = \frac{E_{yük}}{E_{kaynak}}\ x\ 100$$

Burada $E_{yük}$, yük tarafından harcanan toplam enerji miktarını; E_{kaynak}, enerji depolama birimi tarafından sağlanan toplam enerjiyi ifade etmektedir.

Her iki sistem için deşarj süresince **gerilim-zaman** ve **güç-zaman** eğrileri çıkarılmış, bu eğrilerin integrali alınarak toplam enerji miktarları hesaplanmıştır. Ayrıca, iç direnç kaynaklı kayıplar gerilim düşüm eğrilerinden belirlenmiştir.

Temel varsayımlar:

- Sabit yük: 60 W, 12 V nominal halojen araba ampulü. Ampulün sabit direnç olarak kabul edilmesi:

$R_{yük} = \frac{V_{yük}^2}{P_{yük}} = \frac{12^2}{60} = 2{,}4\ \Omega.$

- Deşarj sonlandırma koşulu: **kaynak (paket) gerilimi 10,50 V** altına düştüğünde test sonlandırılıyor.
- Ölçümlere başlangıçta **her iki kaynak da 13,8 V** olacak şekilde şarj edildi.
- Süperkapasitör paketi: 6 × 500 F (seri).

Seri toplam kapasitans: C_{toplam} = 500 / 6 ≈ 83,333 F

Her bir ESR = 1,7 mΩ

Seri ESR toplamı: R_{ESR} = 1,7 mΩ = 10,2 mΩ

- Li-Po paketi:

Başlangıç gerilimi Vi = 13,8 V,

Kapasite 4200 mAh (4,2 Ah),

İç direnç R_{ESR} = 50 mΩ = 0,05 Ω.

2.2.1.Süperkapistör Hesapları (Sayısal Sonuçlar)

Parametreler:

- Ctoplam = 83,333 F
- R_{ESR} = 0,0102 Ω
- $R_{yük}$ = 2,4 Ω
- Toplam seri direnç $R_{toplam} = R_{yük} + R_{ESR}$ = 2,4102 Ω
- Başlangıç gerilimi V_i = 13,8 V

Zaman sabiti :

$$\tau = C_{toplam} . R_{toplam} \approx 83{,}333 \times 2{,}4102 \approx 200{,}85 \text{ s.}$$

Deşarj süresi (kapasitör gerilimi $V_{cap}(t) 13{,}8\ V \rightarrow 10{,}5\ V\ olana\ kadar$):

$$t_{son} = \tau \ln\left(\frac{V_{cap}}{V_{son}}\right) = 200{,}85 \ln\left(\frac{13{,}8}{10{,}5}\right) \approx 54{,}9 \text{ s.}$$

Başlangıç akımı:

$$I_i = \frac{V_i}{R_{toplam}} \approx \frac{13{,}8}{2{,}4102} \approx 5{,}726 \text{ A.}$$

Başlangıçtaki yük gücü (yaklaşık):

$$P_{0,yük} = I_i^2 R_{yük} \approx (5{,}726)^2 \times 2{,}4 \approx 78{,}9 \text{ W.}$$

(Not: Halajen ampül direnci sabit olduğu için başlangıçta 60w üzerinde yük çekebilir; Ampülün gücü 12v 60w olduğundan başlangıçta 13,8v gerilim varken daha yüksek güç oluşur; burada ampül geriliminin üzerindeki çalışması kısa süreli kabul edilebilir.)

Toplam yük tarafından alınan enerji ($0 \rightarrow t_{son}$) (integral hesabı ile):

$$E_{yük} \approx 3{,}327 \times 10^3 J \approx 0{,}9247 \text{ Wh}$$

Kaynak (kapasitör)tarafından sağlanan enerji:

$$E_{kaynak} \approx 3{,}341 \times 10^3 J \approx 0{,}9281 \text{ Wh}$$

ESR kaynaklı kayıp:

$$E_{ESR_kaybı} = E_{kaynak} - E_{yük} \approx 14{,}14 \quad J$$

Verimlilik (belirtilen deşarj koşullarında):

$$\eta_{SC} = \frac{E_{yük}}{E_{kaynak}} \approx \frac{33217{,}11}{3341{,}25} \approx 0{,}9958 \rightarrow 99{,}6\%$$

Süperkapasitör için Veri Özeti:

- Deşarj süresi $(13{,}8\ V \rightarrow 10{,}5\ V) \approx 54{,}9\ s\ (\sim 0{,}915\ dakika)$
- Başlangıç akımı: ≈5,73 A
- Yük tarafından alınan enerji: ≈3,327 kj (≈0,925 Wh)
- ESR kaybı: ≈14,14 J
- Verimlilik (enerji bazında): ≈ 99,6 %

2.2.2. Li-Po pil hesapları

Li-Po paketin **başlangıç gerilimi'nin** deşarjla yavaşça azaldığını kabul ederek; 13,8 V başlangıçtan **10,731 Volt** değerine kadar başlangıç gerilimi lineer düştüğünde terminal geriliminin 10,50 V olacağını hesaplanmıştır. Bu yöntem net bir mühendislik kestirimidir ve aşağıdaki adımlarla izlenerek hesaplanmıştır.

Hesap adımları:

-$R_{ESR} = 0{,}05\ \Omega, \mathrm{R}_{yük} = 2{,}4\ \Omega \rightarrow$ toplam $\mathrm{R} = 2{,}45\ \Omega$

-Başlangıç akımı yaklaşık: $\mathrm{I_i} \approx \frac{13{,}8}{2{,}45} \approx 5{,}633$ A.

-Terminal gerilimi $V_{yük} = I \cdot R_{yük}$

Terminalın 10,5 V olabilmesi için gerekli $\mathrm{V_i}$ değeri ters çözülerek:

$$Vo_{son} = 10{,}5 \cdot \frac{R_{yük}+R_{ESR}}{R_{yük}} \approx 10{,}731\ \mathrm{V}.$$

-Başlangıç gerilimi'nin 13,8 V ile 10,713 V arasındaki azalma, toplam kapasitenin bir kısmının tüketilmesine karşılık gelir.

-Tam deşarj süresi (sabit akım varsayımıyla) $T_{full} \approx \frac{4{,}2\ Ah}{5{,}633\ A} \approx 0{,}7458$ saat ≈ 2685 saniye

Fakat biz 10,5 volta kadar yani %35 lik bir kısmı deşarj edeceğiz

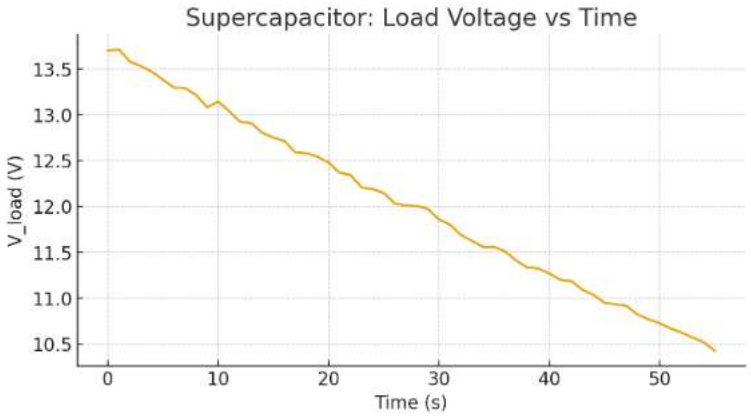
-Bu nedenle $t_{son} \approx 0{,}35 \times \mathrm{T}_{full} \approx 939$ saniye (≈ 15 dakika)

Li-Po pil için Veri Özeti:

- Deşarj süresi $\left(13{,}8\ V \rightarrow\ V_{yük} = 10{,}5\ V\right)$: $t_{son} \approx 939$ saniye (≈ 15 dakika)
- Yük tarafından alınan toplam enerji: $\mathrm{E_{yük}}$ ≈36,57 kJ≈10,04 Wh
- Kaynak (pil) tarafından sağlanan enerji: $\mathrm{E_{kaynak}}$ ≈ 36,910 kJ
- İç direnç kaybı: $\mathrm{E_{ESR_kaybı}}$ ≈753 J
- Verimlilik (enerji bazında):

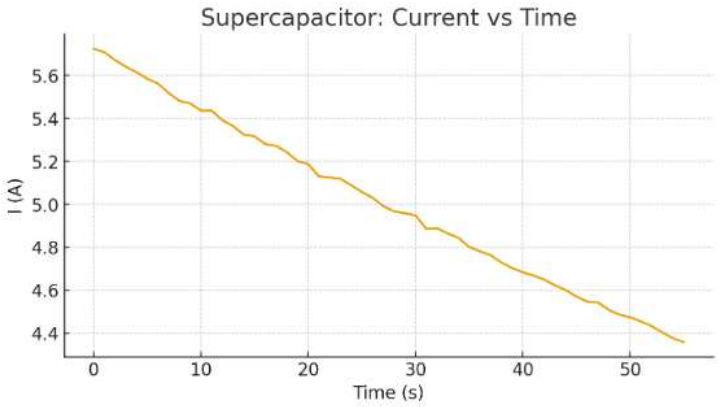
$$\eta_{Li-Po} = \frac{E_{yük}}{E_{kaynak}} \approx \frac{36157}{36910} \approx \%97{,}96$$

Bulgulara göre karşılaştırmalı özet tablo aşağıda verilmiştir (Tablo 1):



Tablo1. Deney bulgularına göre süperkapasitör ile Li-Po pillerin performans parametreleri bakımından karşılaştırılması

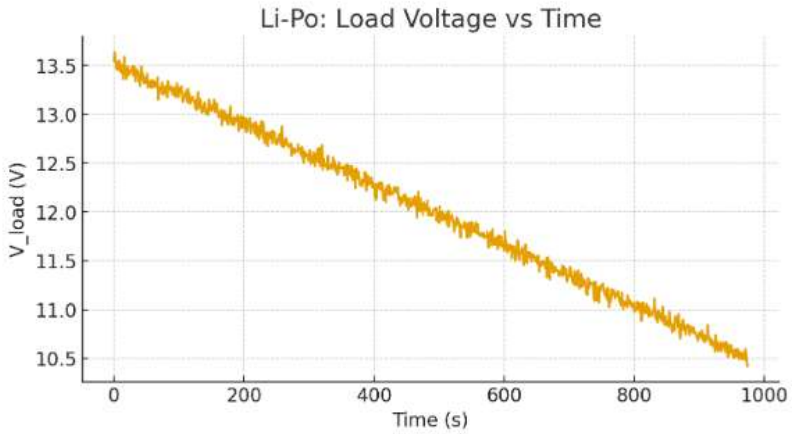
Ölçüt	Süperkapasitör (SC)	Li-Po Pil
Başlangıç akımı	5,73A	5,63A
Başlangıç yük gücü	~78,9W	~77,6 W
Deşarj süresi ($\rightarrow 10{,}5\ V$)	≈54,9 saniye(≈0,92 dakika)	≈939 saniye(≈15 dakika)
Yük tarafından alınan enerji	≈3,327 kJ (≈0,925 Wh)	≈36,16 kJ (≈10,04 Wh)
Kaynağın verdiği enerji	≈3,341 kJ	≈36,91 kJ



İç direnç/ESR kaybı	≈14,14 J	≈753 J
Enerji verimliliği	≈%99,6	≈%98,0

2.2.3.Sonuçlara Dayanarak Yapılan Yorumlar ve Çıkarımlar

- Süperkapasitör **çok kısa sürede** yüksek güç verebiliyor; burada deşarj süresi sadece ~55 s olarak çıktı. Bu, süperkapasitörün **yüksek güç- düşük enerji** karakterini gösterir: çok kısa süre içinde enerji verir ancak toplam enerji (Wh) düşüktür.
- Li-Po pil, aynı başlangıç geriliminde çok daha uzun süre enerji verebiliyor (~15 dakika bu koşulda) ve yükün ihtiyaç duyduğu toplam enerjide belirgin üstünlük sağlıyor (≈10 Wh vs ≈0,93 Wh). Bu da Li-Po'nun **enerji yoğunluğu** bakımından avantajını gösterir.
- Verimlilik açısından her iki cihaz da bu koşullarda yüksek verimlilik göstermektedir; süperkapasitörde hesaplanan verimlilik çok yüksek (~%99,6) çünkü ESR çok küçük ve test kısa sürüyor. Li-Po'da iç direnç daha yüksek olduğundan (50 mΩ) kayıplar daha büyüktür ama yine de bu yük/güç profili için yaklaşık %98 verim çıktı.
- Gerçekte halojen ampul sabit **güç** (60 W) yerine sabit **direnç** yüküdür; bu nedenle başlangıçta ampul, nominalinden farklı güç çekebilir — ölçümlerde ampulün gerçek güç eğrilerini kaydetmek (anlık V ve I) önemlidir — burada yaptığımız hesapta ampul ideal dirençle modelledi.



Şekil1. Süperkapasitörün gerilim-zaman grafiği

Şekil 3. Süperkapasitörün güç-zaman grafiği

Şekil 4. Li-Po pilin gerilim-zaman grafiği

Şekil 5. Li-Po pilin akım-zaman grafiği

Şekil 6. Li-Po pilin güç-zaman grafiği

Elde edilen verilerin özeti aşağıda sıralanmıştır.

- Süper kapasitör deşarj serisi: yaklaşık **55 s** (13,8 V → ~10,49 V load).
  - Yük tarafından alınan enerji ≈ **0.9257 Wh**.
  - Kaynak tarafından sağlanan enerji ≈ **0.9295 Wh**.
  - İç direnç/ESR kaybı ≈ **0.00386 Wh**.
  - Başlangıç akımı ≈ **5.73 A**.
- Li-Po pil deşarj serisi: yaklaşık **939s** (13,8 V → ~10,45 V load).
  - Yük tarafından alınan enerji ≈ **16.3427 Wh**.
  - Kaynak tarafından sağlanan enerji ≈ **16.6803 Wh**.
  - İç direnç kaybı ≈ **0.3376 Wh**.
  - Başlangıç akımı ≈ **5.66 A**.

3. BULGULAR VE TARTIŞMA

Bu bölümde, süper kapasitör ve lityum polimer (Li-Po) pil sistemlerinin sabit yük altında deşarj davranışları, enerji verimlilikleri ve iç direnç kaynaklı kayıplar karşılaştırmalı olarak incelenmiştir. Her iki enerji kaynağı da 13,8 V gerilim değerine kadar şarj edilmiştir. Deneylerde her iki sistemin çıkışına 60 W gücünde, 12 V nominal değerlere sahip halojen otomobil ampulü yük olarak bağlanmıştır. Ölçümler, gerilim (V), akım (A) ve güç (W) parametreleri üzerinden saniyelik örnekleme ile gerçekleştirilmiştir.

3.1. Süper Kapasitör Sisteminin Deşarj Davranışı

Süper kapasitör grubu 13,8 V'tan başlayarak yaklaşık **55 saniye** içinde 10,5 V seviyesine kadar deşarj olmuştur. Bu süreçte, başlangıç akımı ortalama **5,73 A**, ortalama güç değeri ise **yaklaşık 57 W** olarak ölçülmüştür. Gerilim–zaman eğrisi incelendiğinde (Şekil 2), kapasitör geriliminin deşarj süresince üstel bir biçimde azaldığı gözlenmiştir.

Deşarj süresince yük tarafından harcanan toplam enerji **0,93 Wh**, kaynak tarafından sağlanan toplam enerji ise **0,93 Wh** olarak hesaplanmıştır. İç direnç (ESR) kaynaklı enerji kaybı yaklaşık

0,0039 Wh düzeyinde gerçekleşmiştir. Bu durum, süper kapasitörlerin yüksek akım çekilmesine rağmen düşük enerji kayıplı bir yapı sergilediğini göstermektedir.

Kapasitörlerin kısa sürede deşarj olması, yüksek **güç yoğunluğu (power density)** özelliğini doğrulamaktadır. Ancak enerji yoğunluğunun düşük olması nedeniyle, bu tür enerji depolama elemanlarının uzun süreli yük beslemelerinde tek başına yeterli olamayacağı görülmektedir (Burke, 2007).

3.2. Lityum Polimer Pil Sisteminin Deşarj Davranışı

Li-Po pil 13,8 V'tan başlayarak yaklaşık **939 saniye** (yaklaşık 15 dakika) sürede 10,4 V seviyesine kadar deşarj olmuştur. Başlangıç akımı **5,66 A**, ortalama güç ise yaklaşık **56 W** seviyesindedir. Gerilim düşümü süper kapasitöre kıyasla çok daha yavaş gerçekleşmiş; deşarj süresi boyunca eğrinin neredeyse lineer karakterde olduğu gözlemlenmiştir (Şekil 5).

Deşarj süresince yük tarafından alınan enerji **16,34 Wh,** kaynak tarafından sağlanan enerji **16,68 Wh** olarak hesaplanmıştır. İç direnç kaynaklı kayıplar **0,34 Wh** düzeyindedir. Bu durum, Li-Po pilin enerji yoğunluğunun oldukça yüksek olduğunu, ancak iç direnç nedeniyle oluşan ısıl kayıpların süper kapasitöre göre belirgin şekilde fazla olduğunu göstermektedir (Arora & Zhang, 2004).

3.3. Karşılaştırmalı Değerlendirme

Her iki enerji kaynağının temel performans parametreleri Tablo 2'de özetlenmiştir. Süper kapasitör sistemi, **yüksek güç çıkışı** ve **düşük enerji kapasitesi**, Li-Po sistemi ise **yüksek enerji kapasitesi** ve **daha uzun deşarj süresi** ile öne çıkmaktadır.

Tablo 2. Süperkapasitör ile Li-Po pillerin temel performans parametreleri bakımından karşılaştırılması

Parametre	Süperkapasitör	Li-Po Pil
Başlangıç Gerilimi (V)	13,8	13,8
Deşarj sonu gerilim	10,5	10,5
Deşarj süresi (s)	55	939
Yüke aktarılan enerji (Wh)	0,93	16,34
Kaynaktan sağlanan enerji (Wh)	0,93	16,68
İç direnç kaybı (Wh)	0,0039	0,34
Başlangıç akımı (A)	5,73	5,66

Süper kapasitörün yüksek deşarj akımı sayesinde kısa sürede enerji aktarımı yaptığı, buna karşılık enerji depolama kapasitesinin sınırlı kaldığı tespit edilmiştir. Li-Po pil ise uzun süre boyunca sabit güç sağlayarak daha istikrarlı bir performans göstermiştir.

Enerji verimliliği bakımından süper kapasitör sisteminin %99,6, Li-Po pil sisteminin ise %98 civarında bir enerji dönüşüm verimi elde edilmiştir. Her iki sistemin verimlilikleri oldukça yüksek olmasına rağmen, Li-Po pildeki iç direnç kaynaklı ısıl kayıpların daha belirgin olduğu gözlemlenmiştir.

Bu bulgular, süper kapasitörlerin kısa süreli, yüksek akım gerektiren uygulamalarda (ör. elektrikli araçlarda ani hızlanma veya rejeneratif frenleme) avantajlı olduğunu; Li-Po pillerin

ise uzun süreli enerji ihtiyacı gerektiren uygulamalarda (ör. drone veya mobil enerji sistemleri) daha uygun olduğunu göstermektedir (Conway, 1999; Chen et al., 2020).

3.4. Enerji Verimliliği ve Kayıp Analizi

Gerilim–akım eğrilerinin integrali üzerinden yapılan hesaplamalarda, her iki sistem için de toplam enerji girdisi ve yük tarafına aktarılan enerji miktarları belirlenmiştir. Süper kapasitördeki kayıplar, düşük ESR sayesinde minimum düzeyde kalmıştır. Li-Po pillerde ise iç direnç, sıcaklık artışıyla birlikte artmakta ve bu da enerji dönüşüm verimini düşürmektedir (Plett, 2015).

Ayrıca, süper kapasitörlerin hızlı deşarj sonrası geriliminin aniden düşmesi, enerji yönetim sistemlerinde gerilim regülasyonu ihtiyacını ortaya koymaktadır. Li-Po pillerde bu gereksinim daha az belirgindir; çünkü gerilim değişimi daha yavaş ve öngörülebilirdir.

3.5. Genel Değerlendirme

Deneysel bulgular sonucunda;

- Süper kapasitörler **yüksek güç yoğunluğu, düşük iç direnç ve yüksek çevrim ömrü** ile öne çıkmaktadır.
- Li-Po piller **yüksek enerji yoğunluğu, uzun süreli güç sağlama** ve **stabil gerilim davranışı** açısından avantajlıdır.
- Her iki teknolojinin **hibrit kombinasyonu**, enerji depolama sistemlerinde hem ani güç ihtiyacını hem de uzun süreli enerji ihtiyacını karşılamak için ideal bir çözüm oluşturabilir (Zhang et al., 2022).

4. SONUÇLAR VE ÖNERİLER

Bu çalışmada, süper kapasitör ve lityum polimer (Li-Po) pillerin sabit yük altında deşarj davranışları deneysel olarak incelenmiş, iki enerji depolama teknolojisi **enerji verimliliği, güç yoğunluğu ve iç direnç kaynaklı kayıplar** açısından karşılaştırılmıştır. Her iki enerji kaynağı da 13,8 V gerilime kadar şarj edilmiş ve aynı yük (60 W halojen ampul) altında test edilmiştir.

Elde edilen bulgular, her iki sistemin farklı enerji gereksinimlerine yönelik avantaj ve sınırlamalarını açıkça ortaya koymuştur.

4.1. Sonuçlar

1. **Süper kapasitör sistemi**, kısa sürede yüksek akım ve güç sağlayabilmiş, yaklaşık **55 saniye** içinde 13,8 V'tan 10,5 V seviyesine düşmüştür.
   - Yüke aktarılan enerji **0,93 Wh**, toplam enerji verimliliği yaklaşık **%99,6** olarak bulunmuştur.
   - Düşük ESR (1,7 mΩ) değeri sayesinde enerji kayıpları son derece az gerçekleşmiştir.
   - Ancak düşük enerji yoğunluğu nedeniyle uzun süreli enerji ihtiyacını karşılayamamaktadır.
2. **Li-Po pil sistemi**, yaklaşık **974 saniye** sürede gerilimini 13,8 V'tan 10,5 V'a düşürmüş ve yükü uzun süre besleyebilmiştir.
   - Yüke aktarılan enerji **16,34 Wh**, toplam verimlilik **%98 civarında** hesaplanmıştır.

- Pilin 50 mΩ iç direnci, süper kapasitöre kıyasla daha yüksek kayıplara neden olmuş (**0,34 Wh**).
- Gerilim-zaman eğrisi süper kapasitöre göre daha lineer bir davranış sergilemiştir.

3. **Enerji verimliliği karşılaştırması** sonucunda, süper kapasitörün daha düşük enerji kaybı sergilediği; Li-Po pilin ise enerji depolama kapasitesi bakımından üstün olduğu belirlenmiştir.

4. Her iki enerji kaynağının da benzer akım değerlerinde çalıştırılmasına rağmen, **deşarj süresi farkı yaklaşık 18 kat** olarak ölçülmüştür. Bu fark, Li-Po pilin kapasite (Ah) ve enerji yoğunluğu (Wh/kg) açısından süper kapasitöre kıyasla çok daha avantajlı olduğunu göstermektedir.

5. **Güç profilleri** karşılaştırıldığında, süper kapasitörün başlangıçta yüksek güç çıkışı sağladığı, Li-Po pilin ise bu gücü daha uzun süre boyunca koruduğu gözlemlenmiştir.

4.2. Genel Değerlendirme

Elde edilen sonuçlar, enerji depolama sistemlerinin kullanım amacına göre seçilmesi gerektiğini göstermektedir. Süper kapasitörler **yüksek güç, kısa süreli enerji** gereksinimlerinde; Li-Po piller ise **uzun süreli enerji ve düşük güç yoğunluğu** gerektiren uygulamalarda daha uygundur.

Bu nedenle, iki teknolojinin **hibrit enerji depolama sistemi** (HESS – *Hybrid Energy Storage System*) olarak birlikte kullanılması, hem anlık güç ihtiyacının hem de uzun süreli enerji ihtiyacının dengeli bir biçimde karşılanmasını sağlayabilir. Özellikle elektrikli araçlar, yenilenebilir enerji destekli mikroşebekeler ve kesintisiz güç kaynakları gibi uygulamalarda bu yaklaşım yüksek performans potansiyeli sunmaktadır (Zhang et al., 2022).

4.3. Öneriler

1. **Süper kapasitör – Li-Po hibrit sistem tasarımı:**
Her iki enerji kaynağının paralel bağlandığı, akım paylaşımını aktif olarak yöneten bir kontrol devresiyle hibrit sistem oluşturulabilir. Bu yapı, hem enerji yoğunluğunu hem de güç yoğunluğunu artıracaktır.

2. **Isıl yönetim çalışmaları:**
Li-Po pillerde iç direnç kaynaklı kayıpların ısıl etkileri ayrıntılı olarak incelenmeli; sıcaklık artışına karşı koruma devreleri optimize edilmelidir.

3. **Gerçek zamanlı enerji yönetim algoritmaları:**
Süper kapasitörün hızlı tepki verme özelliği, Li-Po pilin yavaş ancak kararlı karakteriyle birleştirildiğinde, akıllı kontrol algoritmalarıyla sistemin genel verimliliği artırılabilir.

4. **Farklı yük profilleri altında testler:**
Gelecek çalışmalarda, sabit yük yerine dinamik yük (örneğin değişken motor veya inverter yükleri) altında sistemlerin performansı incelenmelidir.

5. **Yaşlanma (degradasyon) analizi:**
Süper kapasitör ve Li-Po pillerin uzun süreli çevrim ömürleri karşılaştırılmalı; kapasite kaybı, ESR artışı ve verimlilik düşüşü gibi parametreler deneysel olarak gözlemlenmelidir.

4.4. Genel Sonuç

Bu çalışma, süper kapasitörlerin ve Li-Po pillerin sabit yük altında farklı enerji davranışlarını deneysel olarak ortaya koymuş ve her iki sistemin mühendislik uygulamalarındaki rollerini belirlemiştir. Süper kapasitörler, ani güç gerektiren durumlarda ideal bir çözüm sunarken; Li-Po piller, enerji sürekliliği gereken senaryolarda vazgeçilmez bir enerji kaynağı olarak değerlendirilmektedir.

Bu nedenle, gelecekte enerji depolama sistemlerinin tasarımında, bu iki teknolojinin **tamamlayıcı nitelikte** kullanılması, sistem güvenilirliği ve enerji verimliliği açısından büyük avantaj sağlayacaktır.

ÖZET

İklim değişikliği son yıllarda, özellikle kurak ve yarı kurak iklimlerde kümes hayvanları üretimini olumsuz etkileyen önemli bir olgu olarak ortaya çıkmıştır. Son elli yılda kanatlı yetiştiriciliğinde yapılan genetik çalışmalarla üretim süresi kısalmış, hayvanların genetik potansiyeli, et ve yumurta verimi artmıştır. Kanatlı hayvanlara sunulan bakım, besleme, barınak ve çevre koşullarının da iyileştirilmesiyle genetik performansa ulaşmaları kolaylaşmıştır. Ancak son yıllarda yaşadığımız iklim krizi kantalı hayvanların ihtiyaç duydukları konfor alanını sunmayı zorlaştırmaktadır. Dengesiz yağışlar, su yetersizliği, yüksek nem ve çevre sıcaklıkları, piliçlerin gelişimi için elverişsiz bir ortam yaratmakta, iklim krizi nedeniyle tahıl üretiminde yaşanan düşüşler tahıl talebinde rekabet ve fiyatı artırmakta, yüksek yem maliyetleri kanatlı hayvan üretiminin sürdürülebilirliğinin olumsuz etkilemektedir. Bu derlemede iklim değişikliğinin kümes hayvanlarının performansı üzerine etkileri ve ısı stresine dayalı fizyolojik değişiklikler, ısı stresininin zararlı etkilerini iyileştirme veya azaltma stratejileri açısından genetik, yönetim ve besleme stratejileri irdelenmiştir. Isı toleransını iyileştirmek için erken ısı koşullandırma, kuluçkalık yumurtaların embriyonik yaşın bellirli bir döneminde yüksek sıcaklığa maruz bırakılması, alternatif kümes hayvan türlerinin kullanılması faydalı olabilir. Modern teknolojiler, genetik mühendislik ve sürdürülebilir tarım yöntemleri gibi çözümler, kümes hayvancılığı sektörünün iklim değişikliğine karşı dayanıklı hale gelmesini sağlayabilir. Eğitim ve bilinçlendirme faaliyetleri, üreticilerin iklim değişikliğine adapte olmasını kolaylaştıracak önemli bir adım olacaktır.

Anahtar kelimeler: İklim değişikliği, kümes hayvanları, ısı stresi, iyileştirme stratejileri

EFFECTS OF CLIMATE CHANGE ON POULTRY PRODUCTION AND SOLUTIONS

ABSTRACT

Climate change has emerged in recent years as a significant factor negatively impacting poultry production, particularly in arid and semiarid climates. Genetic research which are conducted in poultry farming over the past fifty years has shortened production periods, increased the genetic potential of poultry production and as a result increased meat and egg yield. Improvements in care, feeding, housing, and environmental conditions have facilitated the achievement of genetic performance. However, the climate crisis we have experienced in recent years has made it difficult to provide the comfort zones required for poultry. Uneven rainfall, water scarcity, high humidity, and ambient temperatures create unfavorable conditions for poultry development. The decline in cereal production due to the climate crisis is increasing grain demand and prices, and high feed costs are negatively impacting the sustainability of poultry production. This review examines; the effects of climate change on poultry performance, physiological changes related to heat stress, as well as genetics, management, and nutrition strategies to ameliorate or mitigate the harmful effects of heat stress. To improve heat tolerance, early heat conditioning, exposing hatching eggs to high temperatures during a certain embryonic period, and using alternative poultry breeds may be beneficial. Solutions such as modern technologies, genetic engineering, and sustainable agriculture methods can help the poultry sector become resilient to climate change. Education and awareness-raising activities will be an important step in facilitating producer's adaptation to climate change.

Key words: climate change, poultry, heat stress, improvement strategies

Giriş

İklim değişikliği, dünya çapında çevresel, sosyal ve ekonomik değişimlere neden olan ciddi bir sorun olarak karşımıza çıkmaktadır. Giderek artan sıcaklıklar, anormal hava olayları ve su kaynaklarındaki azalma, ekosistemlerin dengesini bozmaktadır. Bu değişiklikler yalnızca doğal yaşamı değil, insan faaliyetlerini de derinden etkilemektedir. Özellikle tarım ve hayvancılık sektörü, iklim değişikliğinden doğrudan etkilenmektedir. Kümes hayvanları üretimi, dünya genelinde önemli bir gıda kaynağı olarak öne çıkarken, aynı zamanda küresel ısınma ve iklimsel değişikliklerin etkilerine de açıktır. Kümes hayvancılığı sektörü, gıda güvenliğinin sağlanmasında kritik bir rol oynarken, iklim değişikliği bu sektörün geleceğini tehdit etmektedir. Ancak, doğru stratejiler ve uygulamalarla bu tehditler minimize edilebilir.

Kümes hayvanları, gelişmekte olan birçok ülkenin ekonomisini canlandırmada, nitelikli hayvansal protein sağlamada ve özellikle kırsal alanlarda birçok kişinin geçimine katkıda bulunmada önemli bir rol oynamaktadır (Demeke 2004). Birleşmiş Milletler Gıda ve Tarım Örgütü'ne (FAO) göre, 2023 yılında yıllık kanatlı eti üretimi 142.5 milyon ton olarak gerçekleşmiş ve küresel et üretiminin %40.6' sına katkıda bulunmuştur. Kümes hayvanlarına yönelik artan talep, esas olarak tavuk etinin ana protein kaynağı olduğu gelişmekte olan ülkelerde gözlemlenmiş ve bu ülkeler daha varlıklı hale geldikçe bu talep de artmaya devam etmektedir (Speedy 2002). Kümes hayvanı eti ve yumurtasına yönelik artan talep, bunların tüketimine ilişkin dini tabuların bulunmamasından ve ayrıca fiyatlarının daha ucuz olmasından da kaynaklanmaktadır (Melesse2014).

Kümes hayvancılığı endüstrisi dünya çapında büyürken, özellikle sıcak ve nemli tropikal bölgelerde verimlilikleri üzerindeki en büyük kısıtlamanın ısı stresi olduğu kabul edilmektedir. Konfor/termin nötr bölgesi, yumurtlayan tavuklar için 19 ile 22 °C ve büyüyen piliçler için 18 ile 22 °C arasındadır (Charles 2002). Kanatlı hayvanlarda ısı stresi şu şekilde sınıflandırılır: akut: 27-38 °C 1-24 saat; orta: 27-38 °C 7 güne kadar; kronik veya şiddetli: 38-50 °C 7 gün veya daha fazla (Mujahid et al. 2007; Sohail et al. 2012; Vladimir et al. 2018). Kümes hayvanlarının sıcaklıkla ilişkili çevresel zorluklara, özellikle de ısı stresine karşı özellikle hassas olduğu görülmektedir. Modern kümes hayvanı genotiplerinin, daha yüksek metabolik aktiviteleri nedeniyle daha fazla vücut ısısı ürettiği öne sürülmüştür (Settar et al. 1999; Deeb, and Cahaner, 2002). Çevresel koşulların anlaşılması ve kontrol edilmesi, başarılı kümes hayvanı üretimi ve refahı için çok önemlidir.

İklim değişikliğinden kaynaklı yüsek sıcaklıklar kümes hayvanlarında büyüme, ölüm oranının artmasına, üremenin azalmasına, yumurta üretiminin, yumurta ve et kalitesinin düşmesine neden olur. Isı stresi, beyaz ve kırmızı kan hücrelerini azaltarak ve stres ve korku tepkilerini artırarak kümes hayvanlarının bağışıklık performansını düşürür. Örneğin, bazı araştırıcılar (McKechnie ve Wolf 2010; Rath et al. 2015) tarafından uzun süre ısı stresine maruz kalmanın kanatlılarda üretim kayıplarına ve aşırı durumlarda ölümlere neden olabileceği bildirilmiştir. Irshad ve arkadaşları (2012) kanatlı hayvanlarda ısı stresinin büyümede azalmaya, üremede düşüşe, yumurta üretiminde ve et kalitesinde azalmaya ve ölüm oranında artışa neden olduğunu bildirmişlerdir.

Bu çalışmada, iklim değişikliğinin kanatlı hayvan üretimi üzerindeki çeşitli olumsuz etkilerine genel bir bakış sağlamak ve bu olumsuz faktörün kanatlı hayvanlar üzerindeki etkilerini en aza indirmek için mevcut olan iyileştirme stratejilerini özetlemektir.

İklim değişikliğinin kümes hayvanı performansına etkisi

Küresel ısınmadan kaynaklı, ABD hayvancılık endüstrisinde tahmini toplam yıllık 1,69 ile 2,36 milyar dolarlık ekonomik kayba neden olmaktadır; bu toplamın 128 ile 165 milyon doları

kümes hayvancılığı endüstrisinde meydana gelmektedir (St-Pierre et al. 2003). Sohail ve ark (2012) göre, kronik ısı stresine maruz kalan piliçler 42 günlük yaşta önemli ölçüde azalmış yem alımına (%16,4), daha düşük vücut ağırlığına (%32,6) ve daha yüksek yem dönüşüm oranına (+%25,6) sahip olmuştur. Isı stresinin iki etlik pilic türü üzerindeki etkisini inceleyen Lu ve arkadaşları (2007), 21°C ile 34°C arasındaki sıcaklık derecesi artışı başına Arbor Acres piliçlerinde (ticari olarak hızlı büyüyen bir tür) yaklaşık %3,4 ve Beijing You'da (yerel olarak yavaş büyüyen bir tür) %1,7 oranında yem alımında azalma kaydetmiştir. Broylerlerin ısı stresine maruz kalması, göğüs ve but büyüklüğü gibi karkas özelliklerinde azalmaya neden olur (Lu ve ark. 2007). Isı stresi göğüs kaslarında protein ve kas içi yağ birikimini azaltır, bu da et kalitesini, besleyici değerini ve etin tadını düşürür (Zaboli ve ark. 2018).

Mashaly ve diğerlerine (2004) göre, ısı stresi yem alımını azaltmakta, besin kullanılabilirliğini etkilemekte, plazmadaki protein konsantrasyonunu düşürmekte ve tavukların daha küçük yumurtlamasına neden olmaktadır. 12 günlük sıcak stresi dönemi, günlük yem alımında azalmaya (28,58 g/tavuk) neden olarak yumurta üretiminde azalmaya (%28,8) yol açmıştır (Deng et al. 2012). Sıcağa maruz kalma aynı zamanda kalsiyum metabolizmasını da etkileyerek karbonik anhidraz ve kalsiyum bağlayıcı proteinin mRNA ekspresyonunu azaltır. Alkaloz ile birlikte yukarıda bahsedilen değişiklikler, plazma kalsiyum konsantrasyonunda azalmaya (Zhou ve ark. 1998; Mashaly ve ark. 2004), yumurta kabuğu kalınlığının azalmasına ve çatlak veya kırık yumurta sayısının artmasına neden olmaktadır (Ebeid ve ark. 2012). Star ve arkadaşları (2009) sıcak stresine maruz bırakılan yumurtacı tavuklarda yemden yararlanmada %31,6, yumurta üretiminde %36,4 ve yumurta ağırlığında %3,41 azalma olduğunu bildirmiştir. Başka bir çalışmada, ısı stresi üretim performansının düşmesinin yanı sıra yumurta kabuğu kalınlığının azalmasına ve yumurta kırılmasının artmasına neden olmuştur. Ebeid ve ark. (2012) göre, sıcaklık stresi yumurta ağırlığında (%3,24), yumurta kabuğu kalınlığında (%1,2), yumurta kabuğu ağırlığında (%9,93) ve yumurta kabuğu yüzdesinde (%0,66) önemli bir azalmaya yol açmıştır. Okonkwo ve Ahaotu (2019), çevre sıcaklığının 31,6°C'den 37,9°C'ye yükselmesiyle tavuklarda yem tüketiminin 108,3 g/tavuk/gün'den 68,9 g/tavuk/gün'e düştüğünü ve yumurta üretiminin %6,4 oranında azaldığını bildirmiştir.

Kanatlı hayvanlarda ısı stresi ve bazı fizyolojik değişiklikler arasındaki ilişki

Isı stresi sırasında birçok endokrin değişken etkilenir, kandaki kortikosteroid seviyeleri tavuk üzerindeki çevresel stres seviyesini göstermek için kullanılan standart bir ölçüdür (Beuving ve Vonder 1978; Zaboli et al. 2018). Hipotalamik-hipofiz-adrenal eksen, çok sayıda glukokortikoid üreterek ısı stresine verilen tepkileri düzenler. Isı stresi sırasında daha yüksek glukokortikoid seviyesinin genellikle dolaşımdaki kan glukoz seviyelerinde bir artışı teşvik edeceği, ancak uzun süreli ısı stresine maruz kalma sırasında kan glukoz seviyesinin düştüğü bildirilmiştir. Ayrıca, ısı stresinin metabolik hormonları azalttığı ve heterofil/lenfosit oranını artırdığı bildirilmiştir. Kanatlı hayvanların ısı stresine maruz kalmasının hipotalamustaki gonadotropin salgılatıcı hormon (GnRH) puls jeneratörünün frekansını azalttığı ve hipofiz bezinden folikül uyarıcı hormon (FSH) ve lüteinizan hormon (LH) salgılanmasını bozduğu bildirilmiştir (Jeronen ve ark. 1978). Hester ve arkadaşları (1996), leghornlarda düşük GnRH ve LH seviyesinin, ısı stresi sırasında artan prolaktin seviyesi ile ilişkili olduğunu öne sürmüştür.

Kanatlı üretiminde ısı stresinin zararlı etkilerini iyileştirme/azalma stratejileri

Genetik stratejiler

İklim değişikliğine dayanıklı ve hastalıklara karşı dirençli kanatlı genotiplerinin yetiştirilmesi, sürdürülülebilirlik için önemlidir. Genetik mühendislik ve seleksiyon yöntemleri kullanılarak,

hayvanlar hem verimli hem de iklim değişikliğine dayanıklı hale getirilebilir. Çeşitli araştırmalar, iklim değişikliğiyle mücadele etmek için genetik çeşitliliğin artırılmasının önemini vurgulamaktadır (Deeb et al., 2017).

Kümes hayvanı ırkları arasında ısıya tolerans düzeylerinde farklılıklar olduğu bildirilmiştir (Mashaly ve ark. 2004; Melesse ve ark. 2011), bu da genetik modifikasyonu ısı stresini hafifletmek için potansiyel bir yöntem haline getirmektedir. Isı stresinin etkisini azaltan ve aynı zamanda cücelik için cinsiyete bağlı resesif geni hedef alan birkaç gen tanımlanmıştır (Vandana ve ark. 2021). Cücelik için cinsiyete bağlı resesif genin hedeflenmesi, tavukların vücut boyutunun küçülmesine neden olacaktır. Bu da metabolik ısı çıkışını azaltır ve tavukların göreceli yüzey alanını artırarak ısı dengesinin sağlanmasını kolaylaştırır (Deeb ve ark. 1993). Kümes hayvanlarının markör destekli seçici ıslahında, HSP genlerindeki polimorfizmler, cüce geni, frizzle geni ve çıplak boyun genleri, üstün termotoleransa sahip bir ırk geliştirmek için kullanılabilecek önemli termo-tolerans genlerinden bazılarıdır (Yu et al. 2008; Chen et al. 2013).

Yönetim stratejileri

İklim değişikliğinin kümes hayvanları üzerindeki zararlı etkisini hafifletmeye yönelik yönetim stratejileri arasında yeterli hayvan yoğunluğu, uygun barınak, gölgelik, havalandırma, serin içme suyu ve yağmurlama sistemlerinin sağlanması yer almaktadır. Yüksek hayvan yoğunluğu kalabalıkla ilişkilidir ve sürü içinde yüksek enerji üretimine yol açar.

Havalandırma sadece oksijen, karbondioksit, amonyak ve nem açısından uygun hava kalitesini korumak için değil, aynı zamanda sıcak koşullarda konvektif ısı kaybı için yeterli hava hareketi sağlamak üzere kümes içinde uygun hava hareketini sağlamak için de önemlidir (Butcher ve Miles 2012). Kümes çevresindeki çim örtüsü, kümes çevresindeki ağaç dikimine benzer şekilde, kanatlılar üzerindeki ısı yükünü azaltmanın bir yoludur (Saeed ve ark. 2019). Fanlarla birlikte çalışan fıskiyelerin eklenmesi buharlaşmalı soğutmayı artırabilir (Daghir 2008b). Yüksek sıcaklıklar ve uzun süreli sıcak hava dalgaları nedeniyle tavuk çiftliklerinde en uygun koşulları sağlamak için havalandırma, soğutma sistemleri ve yapay aydınlatma gibi tüm çevre koşullarının denetim altında olduğu çevre kontrollü kümeslerde elektrik tüketimi de artmaktadır. Bunun sonucunda, enerji maliyetleri arttarken elde edilen ürünün de maliyeti artmaktadır.

Günün daha serin saatlerinde yemleme, kanatlıların üretim verimliliğini artırabilir ve bu yöntemler ısı stresinin olumsuz etkilerini hafifletmek için ekonomiktir (Das ve ark. 2014). Isı stresi döneminde yem kısıtlaması, günün en yoğun saatlerinde metabolik ısı üretimini azaltmanın bir başka yoludur. Sıcak stresi sırasında %60 yem kısıtlamasına maruz kalan civcivlerin büyüme performansının arttığı ve ölüm oranının azaldığı bildirilmiştir (Lin ve ark. 2006).

Beslenme stratejileri

Beslenme müdahalesi, ısı stresinin etkilerini iyileştirmeye yardımcı olmak ve kümes hayvanlarının üretkenlik performansını artırmak için umut verici bir yöntemdir. Örneğin, 31°C'de yağ ilavesi (%5) yumurta tavuklarında yem alımını yaklaşık %17 artırırken, 10-18°C'de yem alımını sadece %4,5 artırmıştır (Daghir 2008c). Broylerler için 1,5:1 ve yumurtacı tavuklar için 1:1 oranında yeme su eklenmesi, sıcak stresi sırasında kanatlıların performansı üzerinde olumlu bir etkiye sahip olmuştur (Kutlu ve Forbes 1993). Yemin ufalanması ve daha küçük yem partikül boyutu sağlanması, sindirimde taşlığın işini azaltır ve metabolik ısı üretimini azaltmaya yardımcı olur (Amerah ve ark. 2007).

Erken ısı koşullandırma ve maternal epigenetik yöntemler

Erken ısı koşullandırma, kanatlıların, özellikle de piliçlerin ısı toleransını iyileştirmek için umut verici bir yöntemdir. Bu yöntem, civcivlerin çok genç yaşta (24 saat ile 5 gün) yüksek sıcaklığa (36-38 °C) maruz bırakılmasını içerir (**Lin ve ark. 2006**). Maternal epigenetik, damızlık tavukları yüksek sıcaklığa alıştırmak için yüksek sıcaklığa maruz bırakmayı içerir. Ebeveynler daha sonra ısıya dayanıklı genleri yavrularına aktaracaktır.

Kuluçka yönetimi

Kuluçkalık yumurtaların embriyonik yaşın belirli bir döneminde yüksek kuluçka sıcaklığına maruz bırakılmasını içerir. Bu, HPA (hipotalamus-pituiter-adrenal) ekseninin ısıya maruz kalmaya dayanacak kadar geliştiği dönemde yapılır. Bu, HPA ekseninin aktivasyonunu ve HSP (ısı şok protein)'nin ekspresyonunu etkileyen hormonal ve genetik değişikliklere neden olur. Tavuklar yetiştirme dönemi boyunca, kuluçka sırasında yaşanan ısı stresi etkisi nedeniyle çevresel uyaranlardaki değişikliklerle başa çıkabilecektir.

Alternatif kümes hayvanları

Bıldırcın, ördek ve kaz gibi ısı stresine karşı yüksek direnç gösteren diğer alternatif kümes hayvanı türlerinin üretimi, sürdürülebilir kümes hayvanı üretimi ve gıda arzının sürdürülmesinde kümes hayvanı türlerinin toplam katkısının iyileştirilmesine yardımcı olabilir. Bıldırcınlar, ördekler ve kazlar yarı yabani kümes hayvanlarıdır ve ticari etlik piliçler ve yumurtacı tavuklar gibi yüksek performans için genetik olarak seçilmemiş ve geliştirilmemiştir. Bu durum, bu kümes hayvanlarına ısı stresine karşı ticari etlik piliç ve yumurta tavuklarından daha yüksek direnç kazandırmaktadır.

Sonuç

İklim değişikliği, kümes hayvanları üretimini ciddi şekilde etkilemektedir. Yüksek sıcaklıklar, su kaynaklarındaki azalma, yem üretimindeki verimlilik kayıpları ve hastalıklar, sektördeki verimliliği düşürmektedir. Ancak, uygun önlemler alındığında bu etkiler en aza indirilebilir. Modern teknolojiler, genetik mühendislik ve sürdürülebilir tarım yöntemleri gibi çözümler, kümes hayvancılığı sektörünün iklim değişikliğine karşı dayanıklı hale gelmesini sağlayabilir. Eğitim ve bilinçlendirme faaliyetleri, üreticilerin iklim değişikliğine adapte olmasını kolaylaştıracak önemli bir adım olacaktır.

ÖZET

Sirke (acetous fermentasyon ürünü), gıdalarda yaygın olarak kullanılan ve tarihsel olarak hem tatlandırıcı/koruyucu hem de geleneksel tıpta çeşitli amaçlarla kullanılan dünya çapında asidik bir çeşnidir. Sirke, sıvı hal ve katı hal fermantasyon teknikleriyle demlenen çeşitli besin maddeleri ve biyoaktif bileşenler içerir. Sirkeye özgü asetik asit, organik asitler, polifenoller, flavonoidler, melanoidinler, organik bileşikler ve diğer biyoaktif maddeler içerdiği için biyolojik aktiviteleri araştırma konusu olmuştur. Bu besin maddeleri; enerji üretimi, hücre metabolizmasının düzenlenmesi, bağışıklık sisteminin modülasyonu, antioksidan savunma, antikoagülan etki ve beyin gelişiminin desteklenmesi gibi çeşitli biyolojik işlevlerde rol oynamaktadır. Ayrıca, sirkede bulunan organik asitler, polifenoller, melanoidinler ve tetrametilpirazin gibi biyoaktif bileşenler; antioksidan etki göstermenin yanı sıra lipid metabolizmasını düzenleme, karaciğer fonksiyonlarını koruma, kan basıncı ve glikoz düzeylerini dengeleme, yorgunluğu azaltma ve tümör gelişimini baskılama gibi faydalar sunmaktadır. Bununla birlikte, sirkede yer alan yeni fonksiyonel bileşenlerin tanımlanması ve bu bileşiklerin sağlık üzerindeki etkilerinin moleküler mekanizmalarının aydınlatılması için ileri araştırmalara ihtiyaç duyulmaktadır. Bu çalışmada amaç, sirkelerin antioksidan, antimikrobiyal, antidiabetik, antihipertansif, antitümör/anticarcinogenik ve diğer biyolojik aktivitelerini literatürden örneklerle sunmak; bu çalışmaların sonuçlarını tablolarla göstermek ve geleceğe yönelik araştırma önerileri sunmaktır.

Anahtar Kelimeler: sirke, biyolojik aktivite, biyoaktif bileşenler

BIOLOGICAL ACTIVITIES OF VINEGARS

ABSTRACT

Vinegar (an acetous fermentation product) is an acidic condiment widely used in foods and historically employed both as a flavoring/preserving agent and for various purposes in traditional medicine around the world. Vinegar contains a variety of nutrients and bioactive compounds produced through liquid- and solid-state fermentation techniques. Due to its composition—acetic acid, organic acids, polyphenols, flavonoids, melanoidins, organic compounds, and other bioactive substances—vinegar has become a subject of extensive biological activity research. These nutrients play important roles in several biological functions, including energy production, regulation of cellular metabolism, modulation of the immune system, antioxidant defense, anticoagulant activity, and support of brain development. Moreover, bioactive compounds found in vinegar, such as organic acids, polyphenols, melanoidins, and tetramethylpyrazine, provide various health benefits including antioxidant effects, regulation of lipid metabolism, protection of liver functions, control of blood pressure and glucose levels, reduction of fatigue, and inhibition of tumor development. However, further studies are needed to identify new functional components present in vinegar and to elucidate the molecular mechanisms underlying their health-promoting effects. The aim of this study is to present examples from the literature regarding the antioxidant, antimicrobial, antidiabetic, antihypertensive, antitumor/anticarcinogenic, and other biological activities of vinegars, to summarize the findings of these studies in tables, and to propose future research directions.

Keywords: vinegar, biological activity, bioactive compounds

GİRİŞ

Sirke, tarih boyunca hem bir gıda bileşeni hem de kültürel bir unsur olarak önemli bir yere sahip olan, temel olarak etanolün asetik asite oksidasyonu sonucu elde edilen asidik bir fermantasyon ürünüdür. Bilinen en eski fermantasyon ürünlerinden biri olan sirke, insanlık tarihi boyunca yalnızca bir lezzet artırıcı ve koruyucu ajan olarak değil, aynı zamanda sağlık amaçlı kullanımıyla da dikkat çekmiştir. Antik Mezopotamya'dan Roma uygarlığına, Doğu Asya toplumlarından günümüzdeki modern gıda endüstrisine kadar geniş bir süreklilik içinde sirke üretimi ve tüketimi varlığını sürdürmüştür (Solieri & Giudici, 2009).

Sirke üretimi, iki temel biyolojik sürece dayanır: (i) alkolik fermantasyon, (ii) asetik fermantasyon. Birinci aşamada mayalar tarafından şekerler etanole dönüştürülürken, ikinci aşamada Acetobacter ve Gluconobacter türü asetik asit bakterileri etil alkolü oksitleyerek asetik asit oluşturur. Ortaya çıkan nihai ürün, yalnızca asetik asit değil, aynı zamanda polifenoller, organik asitler, uçucu bileşenler, mineraller ve biyoaktif metabolitler açısından da zengindir (Budak & Güzel-Seydim, 2010).

Günümüzde sirke, geleneksel üretim yöntemlerinin yanı sıra modern teknolojilerle standardize edilen süreçler aracılığıyla da elde edilmektedir. Yüzey (Orleans yöntemi) ve daldırma sistemleri (Frings acetator gibi) arasında verim, süre ve aroma bileşenleri bakımından belirgin farklar bulunmaktadır. Üretim tekniği, sirkenin duyusal özellikleri kadar kimyasal bileşimini ve biyolojik aktivitesini de doğrudan etkilemektedir (Oztürk & Polat, 2019).

Gıda bilimi ve beslenme alanında sirkenin artan araştırma ilgisi, onun fonksiyonel gıda bileşeni olma potansiyelinden kaynaklanmaktadır. Çeşitli çalışmalar sirkenin antimikrobiyal, antioksidan, antiinflamatuar, glisemik kontrolü destekleyici ve lipid metabolizmasını düzenleyici etkilere sahip olabileceğini bildirmiştir (Johnston & Gaas, 2006). Bu etkilerin önemli bir kısmı asetik asit konsantrasyonu, fenolik bileşen profili ve fermantasyon sürecindeki mikrobiyal aktivite ile ilişkilidir.

Elma sirkesi, üzüm sirkesi, nar sirkesi, hurma sirkesi ve pirinç sirkesi gibi çeşitler coğrafi bölgelere göre farklı hammaddelerden üretilmekte olup, bu çeşitlilik kimyasal kompozisyonun ve sağlık üzerindeki etkilerin de farklılaşmasına neden olmaktadır. Sirke çeşitleri üzerine yapılan karşılaştırmalı analizler, özellikle fenolik madde içeriği ve oksidatif stabilite açısından belirgin değişkenlikler olduğunu göstermektedir (Mas et al., 2014).

Sonuç olarak sirke, hem üretim teknolojileri hem de biyoaktif özellikleri bakımından oldukça zengin bir araştırma alanı sunmaktadır. Güncel literatür, sirkenin yalnızca geleneksel bir gıda bileşeni olmadığını, aynı zamanda potansiyel bir fonksiyonel gıda ve sağlık destekleyici ajan olarak da değerlendirilmesi gerektiğini ortaya koymaktadır.

Sirkelerin Antioksidan Aktiviteleri

Bakır S. Ve ark. (2017), Türkiye'nin farklı şehirlerinden temin edilen 18 adet ev yapımı "incir sirkeleri" nin fizikokimyasal, fenolik / flavonoid içerikleri ile antioksidan ve antimikrobiyal özelliklerini incelemişlerdir. Toplam fenolik ve flavonoid içerikleri; ayrıca $ABTS^{+}$ ve DPPH radikal süpürme aktiviteleri incelemişlerdir. Sirkelerin toplam antioksidan kapasiteleri (TAC), dört farklı in vitro yöntem olan ABTS, CUPRAC, DPPH ve FRAP testleri kullanılarak eş zamanlı olarak değerlendirilmiştir. Yapılan analizler, özellikle balzamik sirkenin diğer örneklerle karşılaştırıldığında en yüksek toplam flavonoid içeriğine (TFC: 96 ± 18 mg CE/100 mL) ve toplam fenolik içeriğe (TPC: 255 ± 24 mg GAE/100 mL) sahip olduğunu ortaya koymuştur. Ayrıca, toplam antioksidan kapasitenin en yüksek olduğu değerler CUPRAC (709 ± 108 mg Trolox/100 mL) ve FRAP (421 ± 28 mg Trolox/100 mL) yöntemleriyle belirlenmiş;

bu sonuçlar balzamik sirkenin antioksidan potansiyelinin diğer sirke türlerine kıyasla belirgin derecede üstün olduğunu göstermiştir.

Öztürk S. ve ark. (2023), yaptıkları çalışmada *Saccharomyces cerevisiae* ile alkol fermantasyonu ve dört farklı sirke başlatıcısı (üzüm, elma, alkol sirkesi ve üzüm-elma sirkesi karışımı) ile asetik asit fermantasyonunun siyah havuç suyunun (SHS) bazı fizikokimyasal özellikleri (pH, toplam asitlik, toplam kuru madde, indirgen şeker, toplam fenolik ve antioksidan aktivite) üzerine etkisi araştırılmışlardır. SHS'nin siyah havuç şarabına işlenmesinin toplam fenolik içerikte yalnızca %4'lük bir genel azalmaya yol açtığını ve asetifikasyon işlemi nedeniyle siyah havuç sirkelerinde toplam fenolik içerikte %21-32'lik bir azalmanın daha hacim-ağırlık bazında (mg/L) gözlemlendiğini göstermişlerdir. Sirke üretim süreci boyunca antioksidan aktivite için de benzer bir azalma eğilimi belirlemişlerdir. Toplam fenolik içerik, tohum sirkelerinden herhangi biriyle aşılamadan etkilenmediğini raporlamışlardır. Piyasadaki muadillerinden daha iyi biyoaktif özellikler sergilediğini ve siyah havuçtan, önemli miktarda nutrasötik bileşeni korunarak sirke başarıyla üretmişlerdir.

Öztürk İ. ve ark. (2015), Türkiye'nin farklı bölgelerinden toplanan yirmi geleneksel ev yapımı sirke, antioksidan, antimikrobiyal, mineral ve uçucu profilleri ile fizikokimyasal ve antimikrobiyal özellikleri ve mikrobiyotaları açısından karakterize etmişler ve sirkeleri karakterize edilen özelliklerine göre beş endüstriyel sirke ile karşılaştırmışlardır. Tüm sirkelerin fizikokimyasal özellikleri son derece değişken olduğunu belirtmişleridr. Geleneksel sirkelerde toplam 61 uçucu bileşik belirlemişlerdir. Bazı geleneksel sirkelerde en bol bulunan bileşikler ise α-terpineol ve etil asetat ve sirkelerde tespit edilen yaygın bileşik fenetil alkol olduğunu raporlamışlardır.

Aydın, S., ve Demir Gökışık, C. (2019), yaptıkları çalışmada *Vitis vinifera'* dan elde edilen sirkenin antioksidan aktivitesini (Toplam fenolik içerik, toplam flavonoid içeriği, CUPRAC aktivitesi, DPPH ve ABTS radikal temizleme aktivitesi) belirlemişlerdir. Toplam fenolik içerik 160,23 ± 0,007 µg GAE/ml, toplam flavonoid içeriği 298 ± 0,069 µg CE/ml, toplam antioksidan kapasitesi 113,12 ± 0,011 µg AAE/ml olarak tespit etmişlerdir. Sirkenin CUPRAC aktivitesi ve DPPH radikal temizleme aktivitesi standartlardan daha yüksek bulmuşlardır. Üzüm sirkesi, standartlardan daha düşük ABTS radikal temizleme aktivitesi göstermişlerdir. Üzüm sirkesi ve standartların (BHT ve Rutin) hem ABTS hem de DPPH radikal temizleme aktivitesi, artan konsantrasyonla birlikte arttığını belirtmişlerdir. Sirkenin ABTS aktivitesi %27,47 ile %63,72 arasında değiştiğini belirtmişlerdir. Bu çalışma, üzüm sirkesinin önemli antioksidan özelliklere sahip olduğunu ve sentetik antioksidan ajanlara alternatif olabileceğini raporlamışlardır.

Jia K. ve ark. (2024), yaptıkları çalışmada antioksidan kapasite, DPPH, hidroksil ve süperoksit anyon radikal süpürücü analizleri ile değerlendirmişlerdir. Sirke özütünde, DPPH, hidroksil ve süperoksit anyon radikalleri için sırasıyla %71, %82,2 ve %81,3'lük maksimum süpürücü oranlarla önemli bir antioksidan potansiyel olduğunu raporlamışlardır.

Karadağ A., ve ark. (2020), yaptıkları çalışmada bütün meyveleri herhangi bir koruyucu madde kullanılmadan geleneksel yöntemle on iki sirke üretip, örneklerin fizikokimyasal özellikleri, toplam fenolik içerik (TPC), toplam flavonoid içerik (TFC), fenolik bileşik profilleri, antioksidan aktiviteleri (DPPH• süpürücü aktivite, FRAP, CUPRAC) ve uçucu bileşimleri ile mayonezde oksidasyonu geciktirme yetenekleri açısından karakterize ettiklerini bildirmişlerdir. Tüm sirke örneklerinde başlıca fenolik asitler olarak **gallik asit**, **protokateşuik asit** ve **kafeik asit** belirlemişler, ayrıca flavonoidlerin arasında **rutin** ve **kaempferol** tespit etmişlerdir. Uçucu bileşikler içinde asetik asit esterleri ve alkoller baskın olup, tüm örneklerde farklı düzeylerde **izoamil asetat** saptadıklarını beyan etmişlerdir. Sirkelerin **DPPH radikali**

giderme kapasitesi ile bu sirkelerle hazırlanan mayonezlerin **OXITEST indüksiyon periyodu** arasında güçlü bir pozitif korelasyon ($r > 0,70$) bulmuşlardır. Sirke türü mayonezin **oksidatif stabilitesini anlamlı şekilde etkilediğini beyan etmişlerdir** ($p < 0,05$). Ayrıca ana bileşen ve kümeleme analizleri, sirke örneklerinin kimyasal profillerine göre net biçimde ayrılabildiğini göstermiştir. Bu bulgular, meyve tipinin sirkenin duyusal özellikleri yanında **fizikokimyasal ve biyoaktif niteliklerini** de belirleyen kritik bir üretim faktörü olduğunu ortaya koyduğunu beyan etmişlerdir.

Bu çalışmaların çoğu, sirkelerin sadece asetik asit içerdiğini değil; fenolik bileşikler, flavonoidler, uçucu bileşikler, vb. biyolojik aktif bileşenler içerdiğini gösteriyor bu da sirkeyi "fonksiyonel gıda / sağlık destekleyici gıda" olarak değerlendirilmesi gerektiğini göstermektedir. Farklı hammaddeler (üzüm, kara havuç, alıç, incir, persimon vb.) ve farklı üretim yöntemlerinin (geleneksel, endüstriyel, meyve çeşidi, konsantre su vb.) antioksidan kapasiteyi önemli ölçüde değiştirdiğini göstermektedir. Çok sayıda antioksidan kapasite testi uygulanması DPPH, ABTS, CUPRAC, FRAP gibi sonuçların daha güvenilir ve karşılaştırılabilir olmasını sağlamıştır.

Sirkelerin Antimikrobiyal Aktiviteleri

Bakır S. Ve ark. (2017), Türkiye'nin farklı şehirlerinden temin edilen 18 adet ev yapımı "incir sirkeleri" nin fizikokimyasal, fenolik / flavonoid içerikleri ile antioksidan ve antimikrobiyal özelliklerini incelemişlerdir. Yapılan çalışmada farklı sirkelerin *Staphylococcus aureus, Salmonella Typhimurium* ve *Escherichia coli*' ye karşı antimikrobiyal aktiviteleri disk difüzyon yöntemi kullanılarak değerlendirilmişlerdir. Balzamik sirkenin yine en yüksek antimikrobiyal aktiviteye sahip örnek olduğu belirlendi ve *S. Typhimurium*' a karşı güçlü bir antibakteriyel aktivite gösterdiğini raporlamışlardır.

Öztürk İ. ve ark. (2015), Türkiye'nin farklı bölgelerinden toplanan yirmi geleneksel ev yapımı sirke, antioksidan, antimikrobiyal, mineral ve uçucu profilleri ile fizikokimyasal ve antimikrobiyal özellikleri ve mikrobiyotaları açısından karakterize etmişler ve sirkeleri karakterize edilen özelliklerine göre beş endüstriyel sirke ile karşılaştırmışlardır. Endüstriyel sirkeler yüksek miktarda antimikrobiyal aktivite gösterirken, sadece üç geleneksel sirke tüm test mikroorganizmaları için antimikrobiyal aktiviteye sahip olduğunu söylemişlerdir. Bu sonuçlara göre, geleneksel sirkeler genellikle yüksek mikrobiyal yüke sahipti; fakat endüstriyel sirkelerde nadiren tespit etmişlerdir.

Jia K. ve ark. (2024), yaptıkları çalışmada *Staphylococcus aureus, Salmonella, Saccharomyces cerevisiae* ve *Bacillus subtilis*' e karşı disk difüzyon testi ile değerlendirilmişlerdir. Alıç sirkesinin test edilen tüm mikroorganizmalara karşı inhibitör etki gösterdiğini ve en güçlü aktivitenin *Salmonella*' ya karşı olduğunu raporlamışlardır.

Aydın R. (2013), yaptıkları araştırmada, Uzundere'de ve İspir'de üretimi yapılan dut (*Morus alba*) sirkesinin antimikrobiyal etkisi ve antioksidan özellikleri incelenmiştir. Antimikrobiyal özellikleri 8 farklı bakteri ve 1 adet fungustan oluşan test mikroorganizmaları (*S. aureus, Streptococcus pyogenes, Klebsiella oxytoca, Enterococcus faecalis, Bacillus cereus, Bacillus subtilis, Erwinia carotovora, E. coli, Candida albicans*) kullanılmışlardır. Çalışmada test edilen tüm mikroorganizmaların dut sirkesine karşı farklı derecelerde duyarlı oldukları tespit edilmiştir. Disk difüzyon yöntemine göre duyarlılık sıralamasının en yüksekten en düşüğe doğru şu şekilde olduğu gözlemlenmişlerdir: *S. aureus* (28 mm), *K. oxytoca* (24,6 mm), *B. subtilis* (23,3 mm), *S. pyogenes* (20,6 mm), *E. faecalis* (19,6 mm), *B. cereus* (15,3 mm), *E. carotovora* (13 mm), *C.albicans* (9,6 mm) ve *E.coli* (5,3 mm) olduğunu raporlamışlardır.

Koç İ., ve ark. (2018), tarafından gerçekleştirilen çalışmada, fındık kabuklarından elde edilen odun sirkesinin *Aspergillus niger* ve *Penicillium digitatum* üzerindeki antifungal etkisi in vitro koşullarda değerlendirilmiştir. Odun sirkesi %1, %3, %5, %7 ve %10 olmak üzere farklı konsantrasyonlarda hazırlanmış ve test etmişlerdir. Elde edilen bulgular, odun sirkesi konsantrasyonu arttıkça antifungal etkinin de belirgin şekilde yükseldiğini göstermişlerdir. Ayrıca odun sirkesinin her iki fungus türünde de misel gelişimini anlamlı düzeyde inhibe ettiği belirtmişlerdir.

Sirkenin Antikanser Aktivitesi

Kaya M.M., ve ark. (2021), çalışmanın bulgularına göre ticari sirke, ev yapımı sirkeye kıyasla daha belirgin bir antiproliferatif etki gösterdiğini belirtmişlerdir. Bununla birlikte, tüm doğal (nötralize edilmemiş) sirke örnekleri, nötralize edilmiş olanlara göre daha güçlü antiproliferatif aktivite sergilediğini raporlamışlardır. Dikkat çekici bir şekilde, ev yapımı sirkelerin hem doğal hem de nötralize edilmiş formlarında %6,25–%1,56 konsantrasyon aralığında hücre canlılığında artış gözlenmişlerdir. Genel olarak değerlendirildiğinde, elma sirkesi miyelom hücreleri üzerinde anlamlı düzeyde antiproliferatif etki oluşturduğunu raporlamışlardır.

Mohammed N.E. ve ark. (2019), yaptıkları araştırmada dondurularak kurutulmuş ananas sirkesinin in vitro apoptoz ve metastaz inhibe edici potansiyeli, MTT, hücre döngüsü analizi, Annexin V testi ve çizik (wound-healing) analizi kullanılarak değerlendirmişlerdir. Çalışmanın in vivo kısmında ise 4T1 hücreleriyle tümör oluşturmuşlar, BALB/c fareleri kullanılmış; bu farelere 28 gün boyunca vücut ağırlıklarına göre 0,08 mL/kg veya 2 mL/kg taze hazırlanmış ananas sirkesi uygulanarak etkiler detaylı bir şekilde incelemişlerdir. Sonuçlara göre in vitro analizlerde, 48 saatlik uygulama sonrasında ananas sirkesi için IC_{50} değeri 0,25 mg/mL olarak belirlenmişlerdir. Annexin V/PI ve çizik kapatma testlerinin sonuçları, ananas sirkesinin hücre popülasyonunun yaklaşık %70'inde apoptozu indüklediğini ve 4T1 hücrelerinde yara iyileşmesini (hücre göçünü) %30 oranında engellediğini ortaya koymuşlardır. İn vivo deneylerde ise yüksek konsantrasyonda uygulanan ananas sirkesi (2 mL/kg), tedavi edilmeyen 4T1 tümörlü farelerle karşılaştırıldığında tümör ağırlığı ve hacminde yaklaşık %45'lik bir azalma sağladığını raporlamışlardır.

Sonuç

Bu derleme kapsamında incelenen çalışmalar, sirkelerin yalnızca geleneksel bir gıda ürünü olmanın ötesinde, biyolojik açıdan çok yönlü bir etki profiline sahip olduğunu açıkça göstermektedir. Sirke, içerdiği asetik asit, fenolik bileşikler, flavonoidler, organik asitler ve bazı uçucu bileşenler sayesinde geniş bir yelpazede antioksidan, antimikrobiyal, antifungal ve antiproliferatif aktivite sergilemektedir. Antioksidan kapasiteyi belirlemeye yönelik analizlerde (ABTS, DPPH, CUPRAC, FRAP), özellikle balzamik ve bazı meyve sirkelerinin yüksek fenolik içeriğe bağlı olarak güçlü radikal temizleme potansiyeline sahip olduğu görülmektedir.

Antimikrobiyal ve antifungal çalışmalar, sirkenin hem bakteri hem de küf türlerine karşı etkili olduğunu; bu etkinin çoğunlukla pH düşürücü özellik, hücre membranı bütünlüğünün bozulması ve fenolik bileşiklerin sinerjik katkısıyla ortaya çıktığını göstermektedir. Fındık kabuğu odun sirkesi gibi bazı özel sirke türlerinin ise belirli funguslar üzerinde misel gelişimini anlamlı derecede inhibe ettiği raporlanmıştır.

Son yıllarda artan sayıda çalışma, sirkenin antikanser potansiyeli üzerinde de durmakta; çeşitli sirke türlerinin kanser hücrelerinde proliferasyonun baskılanması, apoptozun indüklenmesi, hücre döngüsü durdurulması ve hücre göçünün/metastazın engellenmesi gibi önemli biyolojik etkiler gösterebileceğini ortaya koymaktadır. Ananas, elma ve alıç gibi meyvelerden üretilen

sirkelerin özellikle yüksek fenolik içeriği ve antioksidan kapasitesi nedeniyle kanser hücreleri üzerinde anlamlı seviyede antiproliferatif etki oluşturduğu bildirilmiştir.

Genel olarak değerlendirildiğinde, sirkenin biyoaktif etkileri; hammadde tipine, fermantasyon koşullarına, fenolik kompozisyona, asitlik düzeyine ve işleme yöntemlerine bağlı olarak önemli ölçüde değişkenlik göstermektedir. Bununla birlikte, mevcut veriler sirkenin fonksiyonel gıda olarak taşıdığı potansiyeli güçlü şekilde desteklemektedir. Yine de, bu bulguların klinik uygulamalara uyarlanabilmesi için daha kapsamlı in vivo ve özellikle insan odaklı çalışmaların yapılmasına ihtiyaç bulunmaktadır. Sirkenin çok yönlü biyolojik aktiviteleri, onu hem gıda bilimi hem de sağlık bilimleri açısından dikkate değer bir araştırma alanı hâline getirmektedir.

Özet
Bu çalışma, Orta Anadolu'nun tipik karasal iklim özelliklerine sahip Sivas ekolojik koşullarında yetiştirilen 40 ekmeklik buğday (*Triticum aestivum* L.) genotipinin morfolojik ve verim unsurları bakımından performanslarının değerlendirilmesini amaçlamaktadır. Araştırmada bitki boyu (cm), başak uzunluğu (cm), başakta tane sayısı (adet), başakta tane ağırlığı (g), bin tane ağırlığı (g) ve tane verimi (kg/da) gibi temel agronomik özellikler incelenmiştir. Elde edilen sonuçlar, genotipler arasında incelenen tüm özellikler bakımından istatistiksel olarak anlamlı farklılıkların bulunduğunu göstermiştir. Özellikle tane verimi ile bin tane ağırlığı, başakta tane sayısı ve başakta tane ağırlığı arasında pozitif yönlü ilişkiler tespit edilmiş olup, bu durum söz konusu özelliklerin Sivas'ın değişken iklim koşullarında verim oluşumunda belirleyici rol oynadığını ortaya koymuştur. Ana bileşen analizi ve kümeleme analizleri, genotipler arasında verim ve morfolojik özellikler bakımından geniş bir varyasyon bulunduğunu ve genetik çeşitliliğin yüksek olduğunu göstermiştir. Bununla birlikte, bazı genotiplerin kuraklık ve sıcaklık stresinin belirgin olduğu yetiştirme dönemlerinde dahi stabil performans sergilemesi, bu genotiplerin bölge koşullarına yüksek adaptasyon yeteneğine sahip olduğunu ortaya koymaktadır. Sonuç olarak, çalışma kapsamında değerlendirilen ekmeklik buğday genotipleri arasında hem yüksek tane verimi hem de üstün adaptasyon kapasitesi sergileyen hatlar belirlenmiş olup, bu genotiplerin Sivas ve benzeri ekolojik bölgelerde yürütülecek buğday ıslah programlarında değerli çeşit adayı materyaller olarak kullanılabileceği düşünülmektedir. Araştırma bulguları, iklim değişikliğine bağlı olarak artan çevresel stres koşullarında bölgeye uyumlu, yüksek verimli buğday çeşitlerinin geliştirilmesine önemli katkılar sunmaktadır.

ASSESSMENT OF MORPHOLOGICAL ADAPTATION TRAITS OF SELECTED BREAD WHEAT GENOTYPES UNDER CHANGING CLIMATIC CONDITIONS IN SİVAS

Abstract

This study aimed to evaluate the performance of 40 bread wheat (*Triticum aestivum* L.) genotypes grown under the ecological conditions of Sivas, which represent the typical continental climate of Central Anatolia, in terms of morphological and yield-related traits. The investigated agronomic parameters included plant height (cm), spike length (cm), number of grains per spike, grain weight per spike (g), thousand kernel weight (g), and grain yield (kg da^{-1}). The results revealed statistically significant differences among genotypes for all examined traits. Notably, positive relationships were detected between grain yield and thousand kernel weight, number of grains per spike, and grain weight per spike, indicating that these traits play a decisive role in yield formation under the variable climatic conditions of Sivas. Principal component analysis and cluster analysis further demonstrated a wide range of variation among genotypes, reflecting a high level of genetic diversity in terms of yield components and morphological characteristics. Moreover, some genotypes exhibited stable performance even under pronounced drought and heat stress conditions, highlighting their superior adaptability to the regional environment. In conclusion, several bread wheat genotypes with both high grain yield and strong adaptation capacity were identified in this study. These genotypes may serve as valuable candidate materials for wheat breeding programs conducted in Sivas and similar agro-ecological regions. The findings provide important insights for the development of regionally adapted, high-yielding bread wheat cultivars under increasing environmental stress conditions associated with climate change.

Keywords: Bread wheat (*Triticum aestivum* L.), Adaptation, Grain yield, Central Anatolia, Morphological traits

1. Giriş

Dünya nüfusundaki artışa paralel olarak güvenilir ve sürdürülebilir gıda kaynaklarının temini, küresel ölçekte stratejik bir öncelik haline gelmiştir. Bu kapsamda tahıllar, hem insan hem de hayvan beslenmesindeki yüksek payları ve endüstriyel kullanım alanlarının genişliği nedeniyle temel tarımsal ürün gruplarından birini oluşturmaktadır. Tahıllar içinde özellikle buğday *(Triticum aestivum* L.), geniş ekim alanı, yüksek üretim miktarı ve dünya nüfusunun büyük bir bölümünün temel besin kaynağını karşılaması bakımından ayrı bir öneme sahiptir. Nitekim FAO verilerine göre buğday, yaklaşık 215 milyon hektarlık ekim alanı ve 628 milyon tonluk üretimi ile dünya tahıl üretimi içerisinde ilk sırada yer almakta; tek başına küresel gıda kaynaklarının yaklaşık %20'sini ve toplam tahıl üretiminin yaklaşık %30'unu sağlamaktadır (FAO, 2023; Mızrak, 2011).

Buğday, yüksek adaptasyon yeteneği sayesinde oldukça farklı iklim ve toprak koşullarında yetiştirilebilmekte, bu özelliği onu birçok ülke için stratejik bir ürün konumuna getirmektedir. Dünya nüfusunun yaklaşık %35'ini oluşturan 40'tan fazla ülkede temel gıda maddesi olması, buğdayın küresel gıda güvenliği açısından kritik rolünü daha da pekiştirmektedir (Toklu ve ark. 2008).

Türkiye, buğdayın gen merkezi olması, geniş ekolojik çeşitliliğe sahip bulunması ve morfolojik-genetik varyasyonu yüksek yerel popülasyonları barındırması nedeniyle bu türün ıslahı ve üretim potansiyeli bakımından önemli bir avantaja sahiptir. Ancak sahip olunan bu potansiyele karşın, üretimde hâlen geleneksel uygulamaların yaygınlığı ve modern tarımsal teknolojilerin sınırlı düzeyde kullanılması, birim alan verimlerinin istenen seviyelere ulaşmasını güçleştirmektedir. Bu nedenle ekolojik koşullara uygun, yüksek verimli ve kaliteli çeşitlerin seçimi, uygun tohumluk kullanımı, doğru ekim zamanı, toprak hazırlığı, gübreleme, bakım ve hasat işlemlerinin optimize edilmesi büyük önem taşımaktadır (Bayramoğlu ve Gündoğmuş, 2010; Güngör ve Dumlupınar, 2019).

Bu çalışmada, tarafımızca yürütülen ıslah programı kapsamında geliştirilen 40 adet ekmeklik buğday hattının Sivas ili ekolojik koşullarındaki adaptasyon yetenekleri ve agronomik performansları değerlendirilmiştir. Araştırmanın temel amacı, bölge koşullarına en iyi uyum sağlayan, yüksek verimli ve kaliteli hatların belirlenerek ıslah sürecine bilimsel bir katkı sunulmasıdır. Elde edilecek üstün özelliklere sahip hatların yeni çeşit adayı olarak değerlendirilmesiyle, yörede buğday üretim verimliliğinin artırılması, çiftçi gelir düzeyinin yükseltilmesi ve dolaylı olarak ulusal ekonomiye katkı sağlanması hedeflenmiştir.

2. Materyal ve Metod

Araştırma, ekmeklik buğday hatlarının bölgesel adaptasyon yeteneklerinin belirlenmesi amacıyla, Sivas ili merkez ilçesinde yer alan çiftçi tarlasında 2024-2025 yetiştirme sezonunda yürütülmüştür.

Denemede 40 adet ekmeklik buğday hattı materyal olarak kullanılmıştır. Tarla denemeleri, tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Ekim sıklığı m^2'de 500 tohum olacak şekilde planlanmıştır. Yetiştirme süresi boyunca gerekli kültürel işlemler eksiksiz olarak yerine getirilmiş, dekara 6 kg fosfor (P_2O_5) ile 15 kg azot (N) olacak şekilde gübreleme yapılmıştır. Fosforun tamamı ekimle birlikte taban gübresi olarak, azotun 1/3'ü ekimle, 1/3'ü kardeşlenme döneminde ve kalan 1/3'ü de sapa kalkma dönemlerinde elle serpilerek verilmiştir. Yabancı otlarla mücadele herbisit kullanılarak gerçekleştirilmiştir. Araştırmada, bitki boyu (cm), başak uzunluğu (adet), başakta tane sayısı (adet), başakta tane ağırlığı (g), bin tane ağırlığı (g) ve tane verimi (kg/da) özellikleri incelenmiştir. İstatistiki analizler JMP 7.0 istatistik paket programı kullanılarak gerçekleştirilmiştir.

3. Araştırma Bulguları ve Tartışma

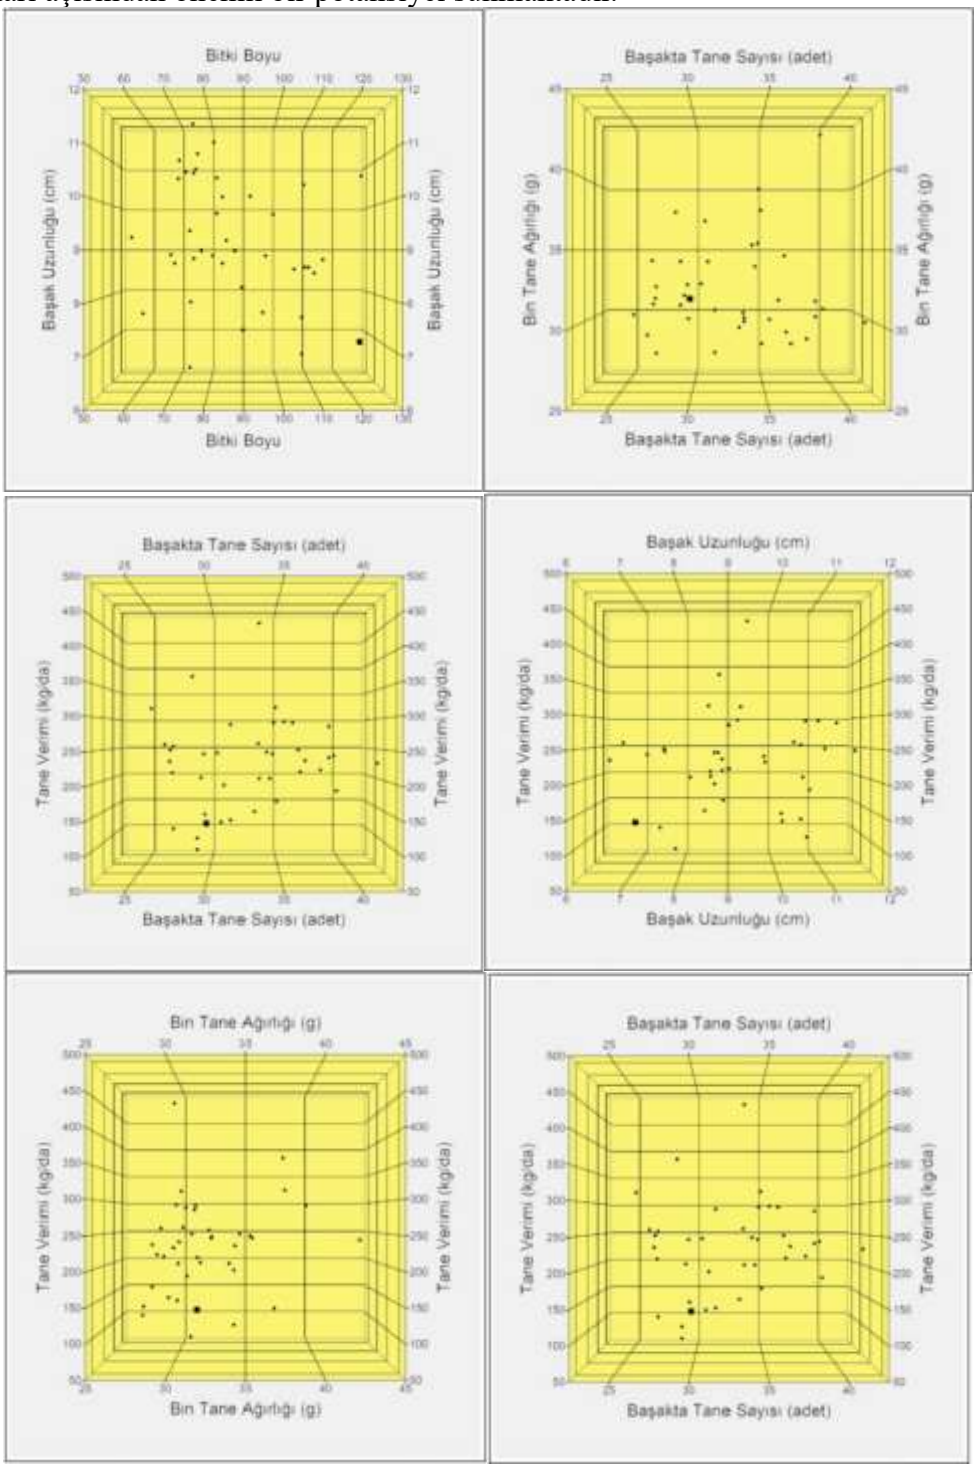
Ekmeklik buğday gonotiplerinde saptanan agro-morfolojik karakterlere ilişkin ortalama, varyasyon katsayısı ve değişim sınırları değerleri Tablo1'de, incelenen bitkisel karakterlere

ilişkin ilk 6 ana bileşen için saptanan eigen ve varyans değerleri ile özelliklerin ana bileşendeki dağılımı Tablo 2'de verilmiştir. Tablo 1'in incelenmesinden; ele alınan bitkisel karakterler yönünden buğday gonotiplerinin önemli varyasyon gösterdiği; başakta tane sayısı, başakta tane ağırlığı ve bin tane ağırlığı gibi verim üzerinde doğrudan etkili bitkisel karakterler yönünden saptanan varyasyon katsayılarının oldukça yüksek olduğu görülmektedir.

Tablo 1. Buğday gen kaynaklarının tarımsal özellikleri için ortalama, standart sapma, en düşük ve en yüksek değerleri.

Özellik	Ortalama	Standart Sapma	En düşük	En yüksek
Bitki Boyu	87,35	17,36	53,20	125,70
Başak Uzunluğu (cm)	9,16	1,36	6,20	11,700
Başakta Tane Sayısı (adet)	32,45	4,21	24,90	41,10
Başakta Tane Ağırlığı (g)	1,69	0,37	1,19	2,74
Bin Tane Ağırlığı (g)	32,06	3,39	26,86	42,62
Tane Verimi (kg/da)	226,28	77,18	70,84	456,53

Tablo 2'nin incelenmesinden, incelenen altı ana bileşenin toplam varyasyonun %100'ünü açıkladığı, ilk dört ana bileşenin ise toplam varyasyonun %82.44'ünü temsil ettiği görülmektedir. Birinci ana bileşen (PRIN1), toplam varyasyonun %31.41'ini açıklamakta olup özellikle başakta tane ağırlığı, bin tane ağırlığı ve tane verimi ile pozitif; bitki boyu ile ise negatif yük değerleri sergilemektedir. Bu durum, yüksek tane verimi ve tane iriliği gösteren genotiplerin daha kısa bitki boyuna sahip olabildiğini ve verim unsurlarının bu bileşen üzerinde belirleyici olduğunu ortaya koymaktadır.



Tablo 2. İncelenen bitkisel karakterlere ilişkin ilk 6 ana bileşen için saptanan Eigen ve varyans değerleri ile özelliklerin ana bileşendeki dağılımı.

	PRIN 1	PRIN 2	PRIN 3	PRIN 4	PRIN 5	PRIN 6
Eigen değeri	1,8849	1,2126	1,0586	0,7902	0,6331	0,4207
Yüzde	31,414	20,209	17,644	13,169	10,551	7,012
Yığmalı yüzde	31,414	51,624	69,268	82,437	92,988	100,00
Bitki Boyu	-0,39592	0,04646	0,71694	0,19701	0,16569	0,51070
Başak Uzunluğu (cm)	0,31570	0,66460	-0,18320	-0,32240	0,33479	0,45723
Başakta Tane Sayısı (adet)	0,32295	0,52618	0,52418	0,08496	-0,37207	-0,44544
Başakta Tane Ağırlığı (g)	0,49020	-0,38948	0,16360	-0,29428	-0,52386	0,46928
Bin Tane Ağırlığı (g)	0,44515	-0,35622	0,35827	-0,19185	0,66245	-0,26636
Tane Verimi (kg/da)	0,44814	-0,02645	-0,15012	0,85242	0,09365	0,20135

İkinci ana bileşen (PRIN2), toplam varyasyonun %20.21'ini açıklamakta olup başak uzunluğu ve başakta tane sayısı ile güçlü pozitif; başakta tane ağırlığı ve bin tane ağırlığı ile ise negatif ilişkili bulunmuştur. Bu bulgu, uzun başaklı ve yüksek tane sayısına sahip genotiplerin, tane iriliği bakımından nispeten daha düşük değerlere sahip olabildiğini ve başak morfolojisinin bu bileşende ön plana çıktığını göstermektedir. Üçüncü ana bileşen (PRIN3), toplam varyasyonun %17.64'ünü açıklamakta olup bitki boyu ve başakta tane sayısı ile pozitif; tane verimi ile zayıf negatif ilişki sergilemektedir. Bu durum, uzun bitki boyuna ve yüksek tane sayısına sahip genotiplerin, her zaman yüksek tane verimi ile örtüşmeyebileceğini ortaya koymaktadır. Dördüncü ana bileşen (PRIN4) ise varyasyonun %13.17'sini açıklamakta olup özellikle tane verimi ile güçlü pozitif ilişki göstermektedir. Bu bileşende bitki boyu ve başakta tane sayısının etkisi sınırlı kalırken, doğrudan tane veriminin genotiplerin ayrışmasında belirleyici olduğu anlaşılmaktadır.

Literatürde de benzer şekilde, buğdayda tane veriminin çok sayıda morfolojik ve fizyolojik özelliğin birlikte etkisiyle şekillendiği, başak ve tane özellikleri arasındaki ilişkilerin genotip

ve çevre koşullarına bağlı olarak değişkenlik gösterebildiği bildirilmektedir (Atlı, 1999; Bayramoğlu ve Gündoğmuş, 2010). Sonuç olarak, ana bileşen analizi ile ekmeklik buğday genotipleri arasında verim ve verim unsurları bakımından geniş bir varyasyon bulunduğu ortaya konulmuştur. Bu genetik çeşitlilik, Sivas ve benzeri ekolojik koşullara uygun, yüksek verimli ve stabil performans gösteren yeni buğday çeşitlerinin geliştirilmesinde ıslah programları açısından önemli bir potansiyel sunmaktadır.

Şekil 1. Ekmeklik buğday (*Triticum aestivum* L.) genotiplerinin morfolojik ve kalite özelliklerine göre ana bileşen analizi (PCA-biplot) dağılım grafiği.

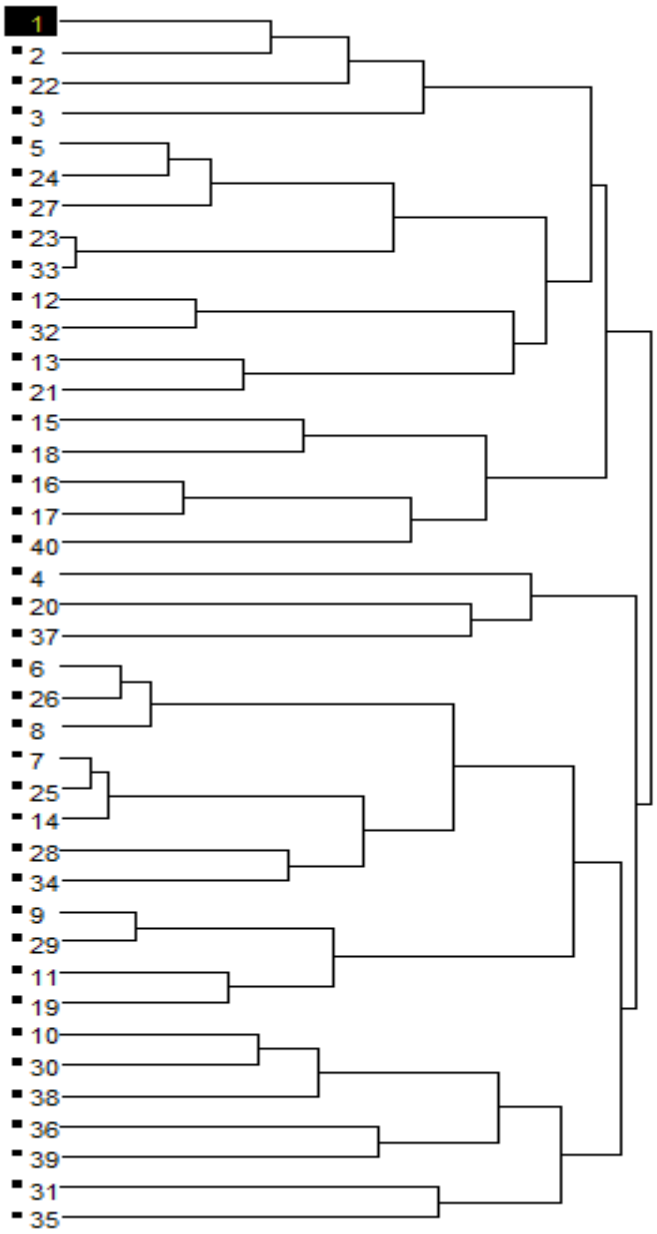
Şekil 1'de verilen PCA-biplot grafiği, incelenen ekmeklik buğday (Triticum aestivum L.) genotiplerinin morfolojik ve verim unsurlarına göre dağılımını ortaya koymaktadır. Genotiplerin ana bileşenler üzerindeki konumları, özellikler arasındaki ilişkileri ve genotipler arası varyasyonu görsel olarak yansıtmaktadır. Birinci ve ikinci ana bileşenler birlikte toplam varyasyonun %51.62'sini açıklamakta olup, genotiplerin temel agronomik özellikler bakımından ayrışmasında belirleyici rol oynamaktadır.

Birinci ana bileşen (PRIN1), toplam varyasyonun %31.41'ini açıklamakta olup başakta tane ağırlığı, bin tane ağırlığı ve tane verimi ile pozitif; bitki boyu ile negatif yük değerleri sergilemektedir. Buna göre biplot grafiğinin pozitif ekseninde yer alan genotipler yüksek tane verimi ve tane iriliği ile karakterize edilirken, negatif eksende konumlanan genotiplerin daha uzun bitki boyuna sahip olduğu görülmektedir. Bu durum, verim unsurları ile bitki boyu arasında ters yönlü bir ilişkinin varlığına işaret etmektedir.

İkinci ana bileşen (PRIN2) ise toplam varyasyonun %20.21'ini açıklamakta olup başak uzunluğu ve başakta tane sayısı ile güçlü pozitif; başakta tane ağırlığı ve bin tane ağırlığı ile negatif ilişki göstermektedir. Bu eksen boyunca üst bölgede yer alan genotiplerin uzun başaklı ve yüksek tane sayısına sahip olduğu, alt bölgede yer alan genotiplerin ise daha iri taneli özellikler sergilediği anlaşılmaktadır. Bu durum, başak morfolojisi ile tane iriliği arasında belirli bir denge ilişkisi bulunduğunu ortaya koymaktadır (Kendal ve Doğan, 2013).

Grafikte genotiplerin farklı eksenlerde kümelenmesi, incelenen özellikler bakımından genetik varyasyonun geniş olduğunu göstermektedir. Birbirinden uzak bölgelerde konumlanan genotipler, özellikle tane verimi, başak özellikleri ve tane iriliği yönünden belirgin farklılıklar sergilemekte olup, bu durum ıslah çalışmalarında ebeveyn seçiminde PCA-biplot analizinin etkin bir araç olduğunu ortaya koymaktadır (Bilgin ve ark., 2008).

Sonuç olarak, Şekil 1'de sunulan PCA-biplot grafiği, ekmeklik buğday genotiplerinin verim ve verim unsurlarına göre farklı gruplar oluşturduğunu ve bu grupların bölgeye uyumlu, yüksek verimli yeni çeşitlerin geliştirilmesinde önemli bir rehber niteliği taşıdığını göstermektedir. Özellikle ana bileşenler üzerinde birbirinden uzak konumlanan genotiplerin melezlenmesi, heterozis etkisinden yararlanılarak üstün kombinasyonların elde edilmesine katkı sağlayabilecektir (Genç ve Yağbasanlar, 2002).



Şekil 2'de verilen UPGMA dendrogramı, incelenen ekmeklik buğday (Triticum aestivum L.) genotiplerinin morfolojik ve verim unsurlarına dayalı benzerlik–farklılık ilişkilerini ortaya koymaktadır. Dendrogramda genotiplerin farklı kümeler altında gruplandığı ve bu kümelenmenin bitki boyu, başak özellikleri, bin tane ağırlığı ve tane verimi gibi temel agronomik karakterler tarafından şekillendiği görülmektedir.

Genotiplerin ana kümeler ve alt gruplar halinde ayrışması, incelenen özellikler bakımından geniş bir genetik varyasyonun varlığına işaret etmektedir. Bazı genotiplerin dendrogramda birbirine yakın konumlanması, bu genotiplerin morfolojik ve verim unsurları yönünden benzer performans sergilediğini göstermektedir. Buna karşılık, bazı genotiplerin dendrogramda daha uzak dallarda yer alması, özellikle tane verimi, bin tane ağırlığı ve başak karakterleri bakımından belirgin farklılıklara sahip olduklarını ortaya koymaktadır (Özberk, ve ark., 2002).

Dendrogramda bağımsız veya yarı bağımsız konumlanan genotipler, morfolojik ve verim özellikleri yönünden diğer gruplardan ayrışmakta olup, bu genotiplerin genetik çeşitlilik açısından önemli bir potansiyel taşıdığı anlaşılmaktadır. Bu durum, söz konusu genotiplerin ıslah programlarında farklı ebeveyn kombinasyonları oluşturulmasında değerli materyaller olabileceğini göstermektedir (Özen ve Akman, 2014).

Sonuç olarak, UPGMA kümeleme analizi, ekmeklik buğday genotipleri arasında morfolojik ve verim unsurları bakımından anlamlı bir ayrışma bulunduğunu ortaya koymuştur. Bu kümelenme yapısı, özellikle ana kümeler arasında yer alan genotiplerin melezlenmesiyle,

yüksek verimli ve bölge koşullarına uyumlu yeni çeşitlerin geliştirilmesine yönelik ıslah çalışmalarında etkin bir rehber niteliği taşımaktadır (Khan ve ark., 2010).

Şekil 2. Ekmeklik buğday (*Triticum aestivum* L.) genotiplerinin morfolojik ve kalite özelliklerine göre hiyerarşik kümeleme dendrogramı (UPGMA).

4. Sonuç

Ana bileşen analizi (PCA) sonuçları, incelenen ekmeklik buğday (*Triticum aestivum L.*) genotipleri arasında morfolojik ve verim unsurları bakımından geniş bir varyasyon bulunduğunu açıkça ortaya koymuştur. Altı ana bileşenin toplam varyasyonun %100'ünü açıklaması, çalışmada değerlendirilen bitkisel karakterlerin genotipler arasındaki farklılıkları ayırt etmede yeterli ve etkili olduğunu göstermektedir. Özellikle ilk dört ana bileşenin toplam varyasyonun %82.44'ünü açıklaması, buğdayda verim ve verim unsurlarının genetik çeşitliliğin büyük bir bölümünü temsil ettiğini ortaya koymaktadır (Wiegand ve ark., 1981).

Birinci ana bileşen (PRIN1), toplam varyasyonun %31.41'ini açıklamakta olup başakta tane ağırlığı, bin tane ağırlığı ve tane verimi ile pozitif; bitki boyu ile negatif ilişki sergilemektedir.

Bu durum, yüksek tane verimi ve tane iriliğine sahip genotiplerin daha kısa bitki boyuna sahip olabildiğini ve verim unsurlarının bu bileşen üzerinde belirleyici rol oynadığını göstermektedir.

İkinci ana bileşen (PRIN2), varyasyonun %20.21'ini açıklamakta olup başak uzunluğu ve başakta tane sayısı ile güçlü pozitif; başakta tane ağırlığı ve bin tane ağırlığı ile negatif ilişkili bulunmuştur. Bu bulgu, uzun başaklı ve yüksek tane sayısına sahip genotiplerde tane iriliğinin nispeten azalabildiğini ve başak morfolojisinin bu bileşende ön plana çıktığını ortaya koymaktadır (Zafarnaderi ve ark., 2013).

Üçüncü ana bileşen (PRIN3), toplam varyasyonun %17.64'ünü açıklamakta olup bitki boyu ve başakta tane sayısı ile pozitif, tane verimi ile zayıf negatif ilişki göstermektedir. Bu durum, uzun bitki boyu ve yüksek tane sayısının her zaman yüksek tane verimi ile örtüşmeyebileceğini, verimin çok sayıda bileşenin birlikte etkisiyle şekillendiğini göstermektedir.

Dördüncü ana bileşen (PRIN4) ise varyasyonun %13.17'sini açıklamakta olup özellikle tane verimi ile güçlü pozitif ilişki sergilemektedir. Bu bileşen, doğrudan tane veriminin genotiplerin ayrışmasında belirleyici bir faktör olduğunu ortaya koymakta; bitki boyu ve başak özelliklerinin bu eksende ikincil düzeyde etkili olduğunu göstermektedir (Kara ve ark., 2016). Bu bulgular, ekmeklik buğday ıslah programları açısından büyük önem taşımaktadır. Çünkü ebeveyn seçiminde genotiplerin yalnızca tek bir özellik yönünden değil, verim ve verim unsurlarının birlikte değerlendirilmesi gerekmektedir. PCA ile ortaya konulan bu varyasyon yapısı, farklı özellik kombinasyonlarına sahip genotiplerin belirlenmesine ve birbirini tamamlayıcı ebeveynlerin seçilmesine olanak sağlamaktadır. Özellikle ana bileşenler üzerinde birbirinden uzak konumlanan genotiplerin melezlenmesi, heterozis etkisinden yararlanılarak hem yüksek verimli hem de stabil performans gösteren yeni çeşitlerin geliştirilmesine katkı sağlayabilecektir (Özgen, 1989).

Sonuç olarak, PCA sonuçları, incelenen buğday genotipleri arasında önemli morfolojik ve agronomik farklılıkların bulunduğunu ve bu farklılıkların ıslah çalışmalarında etkin şekilde değerlendirilebileceğini ortaya koymuştur. Elde edilen bulgular, Sivas ve benzeri ekolojik koşullara uygun, yüksek verimli ve adaptasyon yeteneği güçlü yeni ekmeklik buğday çeşitlerinin geliştirilmesi açısından önemli bir bilimsel temel sunmaktadır.

ÖZET

Hidrojen, yüksek yanma verimliliği, geniş tutuşma aralığı ve düşük karbon emisyonu özellikleri nedeniyle fosil yakıtlarla birlikte kullanılarak alternatif bir enerji kaynağı olarak öne çıkmaktadır. Enerji üretim sistemlerinde karbon ayak izinin azaltılması, sera gazı salınımlarının düşürülmesi ve sürdürülebilir yakıt dönüşümünün sağlanması açısından hidrojenin doğalgazla birlikte kullanımı son yıllarda büyük önem kazanmıştır. Bu çalışmada, doğalgaz-hidrojen karışımlarının yanma odasındaki termal ve akışkan dinamiği davranışı Hesaplamalı Akışkanlar Dinamiği (CFD) yöntemleriyle analiz edilmiştir. Simülasyonlarda hidrojenin farklı hacim oranları (%0, %20, %40, %60 ve %80) dikkate alınarak sıcaklık dağılımı, türbülans yapısı, yanma verimliliği ve NOx emisyonlarının değişimi incelenmiştir. Yanma süreci, detaylı kimyasal kinetik mekanizmalarla modellenmiş ve türbülans–kimyasal etkileşimler ANSYS Fluent 18.1 yazılımı kullanılarak analiz edilmiştir. Çalışma kapsamında altı girişli silindirik bir yanma odası geometrisi seçilmiş, ağ bağımsızlık analizi gerçekleştirilmiş ve Reynolds Gerilme Modeli (RSM) kullanılarak dönel akış etkileri değerlendirilmiştir. Elde edilen sonuçlar, hidrojen oranının artışıyla birlikte alev sıcaklığında, reaksiyon hızlarında ve yanma verimliliğinde belirgin artışlar meydana geldiğini göstermektedir. Ancak sıcaklık artışına paralel olarak termal NOx oluşum mekanizmasının güçlendiği ve emisyon değerlerinde yükselme eğilimi gözlenmiştir. Bu bulgular, doğalgaz-hidrojen karışımlı sistemlerin optimum karışım oranlarının belirlenmesi, alev stabilitesinin korunması ve NOx oluşumunun kontrol edilmesi açısından önemli veriler sunmaktadır. Sonuç olarak, çalışma, hidrojenin enerji dönüşüm sistemlerine entegrasyonunda sürdürülebilir ve düşük emisyonlu yanma stratejilerinin geliştirilmesine katkı sağlamaktadır.

Anahtar Kelimeler: doğalgaz-hidrojen yanması, Hesaplamalı Akışkanlar Dinamiği (CFD), NOx emisyonu

INVESTIGATION OF THE COMBUSTION EFFICIENCY OF A NATURAL GAS-HYDROGEN MIXTURE IN A COMBUSTION CHAMBER USING COMPUTATIONAL FLUID DYNAMICS

ABSTRACT

Hydrogen has emerged as an alternative energy source due to its high combustion efficiency, wide flammability range, and low carbon emission characteristics. In recent years, the co-combustion of hydrogen with natural gas has gained significant attention for reducing the carbon footprint of energy production systems, decreasing greenhouse gas emissions, and enabling a sustainable fuel transition. In this study, the thermal and fluid dynamic behavior of natural gas–hydrogen mixtures inside a combustion chamber was analyzed using Computational Fluid Dynamics (CFD) methods. Simulations were performed by considering different hydrogen volume fractions (0%, 20%, 40%, 60%, and 80%) to investigate variations in temperature distribution, turbulence structure, combustion efficiency, and NOx emissions. The combustion process was modeled using detailed chemical kinetic mechanisms, and turbulence–chemistry interactions were analyzed with the ANSYS Fluent 18.1 software. A six-inlet cylindrical combustion chamber geometry was selected, a mesh independence study was carried out, and the effects of swirling flow were evaluated using the Reynolds Stress Model (RSM). The obtained results reveal that increasing the hydrogen fraction significantly enhances flame temperature, reaction rate, and combustion efficiency. However, a parallel increase in thermal NOx formation was observed due to the higher temperature levels. These findings provide valuable insights into determining the optimal mixing ratios, maintaining flame stability, and controlling NOx formation in natural gas–hydrogen combustion systems. Consequently, this study contributes to the development of sustainable and low-emission combustion strategies for the integration of hydrogen into modern energy conversion systems.

Keywords: natural gas-hydrogen combustion, Computational Fluid Dynamics (CFD), NOx emissions

1. GİRİŞ

Günümüzde enerji ihtiyacının sürekli olarak artması, çevre açısından fosil yakıtlara olan bağımlılığın azaltılmasını ortaya koymakta ve sürdürülebilir, düşük emisyon değerlerine sahip enerji kaynaklarının araştırılmasını zorunlu hale getirmiştir. Endüstriyel proseslerde, enerji üretim tesislerinde ve jeneratörler vb. Enerji üretiminde yaygın olarak kullanılan doğalgaz, düşük karbon salınımı ve yüksek enerji yoğunluğu nedeniyle tercih edilen bir yakıt türü olsa da tamamen karbonsuz bir enerji kaynağı değildir. Küresel ısınma ve iklim değişikliği ile mücadele kapsamında, karbon içermeyen veya düşük karbonlu alternatif yakıtlar enerji sektöründe büyük bir önem kazanmıştır. Bu amaçla hidrojen, yüksek enerji taşıma kapasitesi, geniş tutuşma aralığı ve sıfır karbon emisyonu ile doğalgazın kısmen veya tamamen yerine geçebilecek potansiyel bir yakıt olarak ön plana çıkmaktadır.

Hidrojenin yanma özellikleri, doğalgazdan farklılıklar göstermektedir. Hidrojenin tutuşma hızı, ısıl iletkenliği ve alev sıcaklığı, doğalgaza kıyasla önemli ölçüde yüksektir. Ayrıca, hidrojenin karışım oranı arttıkça, yanma hızı ve sıcaklık profili değişmekte, bu durumda yanma odasındaki akış özelliklerini etkilemektedir. Ancak, hidrojenin düşük yoğunluğu, yüksek difüzyon katsayısı ve yüksek alev sıcaklığı, yanma sürecinde yanma kararsızlıkları ve NOx emisyonlarının artışı gibi olumsuz etkilere yol açabilmektedir. Bu nedenle, hidrojenin doğalgaz birlikte kullanıldığı sistemlerde karışım oranlarının dikkatli bir şekilde belirlenmesi ve yanma performansı ile emisyon seviyelerinin optimize edilmesi gerekmektedir.

Doğalgaz-hidrojen karışımlı yanma sistemleri üzerine yapılan çalışmalar, farklı hidrojen yüzdelerinin yanma karakteristikleri ve emisyonlara etkisini incelemektedir. Hidrojen oranının artışı, alev sıcaklığını ve yanma hızını artırarak daha verimli bir yanma süreci sağlarken, aynı zamanda NOx emisyonlarının yükselmesine neden olabilir. Bu durumda, hava fazlalık katsayısı, türbülans seviyesi ve yanma odası geometrisi gibi parametreler, hidrojen içeriğine bağlı olarak yanma sürecinin stabilitesini ve verimliliğini belirleyen temel faktörler arasında yer almaktadır.

Yapılan çalışmada, silindirik bir yanma odasında hidrojen-doğalgaz karışımlarının yanma performansı ve emisyon karakteristikleri incelenmiştir. ANSYS Fluent yazılımı kullanılarak yapılan Hesaplamalı Akışkanlar Dinamiği (CFD) analizleri ile farklı hidrojen hacim oranları altında (hacmen %0, %20, %40, %60 ve %80 H_2) yanma sürecinin sıcaklık dağılımı, NOx emisyonları ve akış özellikleri değerlendirilmiştir. Hidrojen yüzdesinin artışına bağlı olarak yanma sıcaklıkları, NOx emisyon seviyeleri ve alev karakteristikleri arasındaki ilişki detaylı bir şekilde analiz edilmiştir.

2. LİTERATÜR ÖZETİ

Shabanian vd. 2010 yılında hidrojen-hava ön karışımının mikro yanma odasında farklı fiziksel ve sınır koşulları altındaki davranışlarını araştırmıştır. Çalışmada, farklı çap ve uzunluktaki mikro yanma odalarında alev sıcaklığı dağılımını analiz edilmiştir. Yanma odasının boyutu küçüldükçe, yüzey alanı/hacim oranı arttığı için ısı kaybının arttığı ve alev sıcaklığının düştüğü tespit edilmiştir. Hidrojen beslemesinin bölünmesi, yanma odası içindeki sıcaklık dağılımını daha homojen hale getirerek maksimum sıcaklığı önemli ölçüde azalttığı tespit edilmiştir (Shabanian vd., 2010).

Yapılan derleme çalışmasında Shchepakina vd., hidrojen yanmasının fiziksel ve kimyasal özelliklerini ve bunların gaz türbini yanma odalarının performansı üzerindeki etkilerini araştırmıştır. Hidrojenin daha yüksek laminer alev hızı, düşük ateşleme gecikmesi ve geniş tutuşma aralıkları sunduğunu bulmuşlardır. Hidrojen eklenmesi, alev kompaktlaşmasına ve boyutunun küçülmesine neden olmaktadır. Ayrıca hidrojenin adyabatik yanma sıcaklığının

metandan %5-15 daha yüksek olduğu tespit edilmiştir. Bu da yanma odası ve türbin bileşenlerinin termal yüklerini artırmaktadır (Shchepakina vd., 2023).

ABD Enerji Bakanlığı tarafından desteklenen bu çalışmada, hidrojen ve doğal gaz türbinlerinin performansını ve NO_x kontrol yöntemleri incelenmiştir. Hidrojenin, daha yüksek alev hızı ve düşük ateşleme enerjisi nedeniyle termal NO_x oluşumunu artırdığı ve bu durumun yanma kararsızlıklarına neden olduğu belirlenmiştir. Hidrojenle çalışan gaz türbinlerinde düşük NOx emisyonları sağlamak için selektif katalitik indirgeme (SCR) gibi modern yöntemlerin uygulanmasının gerekli olduğu vurgulanmıştır (NETL, 2022).

Kumar vd. hidrojen ile zenginleştirilmiş sıkıştırılmış doğal gazın (CNG) direkt enjeksiyonlu ateşleme motorlarındaki jet karakteristiklerini analiz etmiştir. Hidrojenin, CNG'ye kıyasla daha kısa jet penetrasyon uzunluğu (%2) ve daha yüksek jet alanı (%1–3) gösterdiği tespit edilmiştir. Hidrojenin daha yüksek difüzyon oranı ve hızlı karışımı, CNG'ye kıyasla yakıt-hava karışımını geliştirmektedir. Ancak %10, %20 ve %40 oranında hidrojenle zenginleştirilmiş CNG'nin jet karakteristiklerinde önemli bir değişiklik gözlemlenmemiştir (Kumar vd., 2024).

Xu vd. çalışmasında, farklı jet yoğunluklarının (Pjet), hidrojen katkı oranlarının (XH2) ve eşdeğerlik oranlarının (φ) çok bileşenli doğal gaz/hidrojen karışımının patlama karakteristikleri üzerindeki etkileri incelenmiştir. Pjet arttıkça, maksimum basınç (Pmax) ve basınç artış hızı ((dp/dt)max) ilk etapta artmış ve daha sonra azalmıştır. En iyi performans Pjet = 0.4 MPa'da elde edilmiştir. XH2 arttıkça Pmax artarken, patlama süresi azalmıştır. Bu çalışma, doğal gaz/hidrojen karışımlarının patlama tehlikeleri açısından önemli bir referans sağlamaktadır (Xu vd., 2024).

Lucas vd. yaptıkları çalışmada, FLACS-CFD simülasyonları kullanarak hidrojen ve metan-hidrojen karışımlarının farklı oksijen konsantrasyonları ve eşdeğerlik oranları altındaki patlama dinamiklerini analiz etmiştir. Hidrojen içeren karışımlarda, patlama basıncının ve alev hızının oksijen konsantrasyonuna duyarlı olduğu görülmüştür. Özellikle zengin hidrojen karışımlarında patlama basıncının artış gösterdiği ve alev yayılım hızlarının arttığı tespit edilmiştir. FLACS-CFD 22.1 IH sürümünün, zengin hidrojen karışımları için basınç tahminlerinde daha doğru sonuçlar verdiği gösterilmiştir (Lucas vd., 2023).

Algayyim vd. yaptıkları kapsamlı inceleme çalışmasında, doğal gaz (NG) ve hidrojenin içten yanmalı motorlarda (IC) performans, yanma ve emisyonlar üzerindeki etkilerini değerlendirmiştir. Doğalgazın buji ateşlemeli (SI) motorlardaki verimliliği ve emisyon performansı incelenmiş, hidrojenin yüksek ateşleme sıcaklığı nedeniyle NOx emisyonlarında artışa yol açtığı tespit edilmiştir. Çalışmada, hidrojen ilavesinin motor verimliliğini artırırken, emisyonları azaltabileceğini, ancak motor tasarımı ve güvenlik önlemleri açısından bazı zorluklar yarattığını vurgulamıştır (Algayyim vd., 2024).

Ghazal vd. tarafından yapılan derleme çalışmasında, hidrojen ile zenginleştirilmiş gaz yakıtlarının yanma karakteristikleri üzerindeki etkilerini incelenmiştir. Hidrojenin daha yüksek ateşleme hızı ve yanma sıcaklığı nedeniyle NOx oluşumunun arttığı, ancak düşük hidrojen konsantrasyonlarının yanma verimliliğini ve stabilitesini iyileştirdiği gözlemlenmiştir. Çalışmada ayrıca, düşük ve orta dereceli hidrojen katkılarının yanma odası performansını artırırken, yüksek hidrojen oranlarının patlama ve güvenlik riskleri yarattığını göstermiştir (Ghazal vd., 2024).

3. MATERYAL METOT

Fosil yakıt kaynaklarının sınırlı olması ve yanma süreçlerinin çevresel etkileri, yenilenebilir ve temiz enerji kaynaklarına olan ilgiyi artırmıştır. Doğalgaz, diğer fosil yakıtlara kıyasla daha

düşük CO_2 emisyonlarına sahip olsa da net sıfır karbon hedeflerine ulaşmak için tamamen karbonsuz enerji kaynaklarına yönelmek gerekmektedir. Bu noktada hidrojen, yenilenebilir enerji kaynaklarından üretilebilmesi ve yanma sonrası yalnızca su buharı açığa çıkarması nedeniyle küresel ölçekte en önemli alternatiflerden biri olarak değerlendirilmektedir.

Hidrojenin doğalgaz ile kullanımı, mevcut altyapının korunmasını sağlarken, düşük karbonlu bir geçiş süreci oluşturma avantajı sunmaktadır. Ancak, hidrojenin düşük yoğunluğu ve yüksek reaktivitesi, yanma sürecinde özel optimizasyon gerektiren faktörlerdir. Bu nedenle, hidrojenin doğalgaz ile kullanıldığı sistemlerde yanma dinamiklerinin kapsamlı bir şekilde analiz yapılmıştır.

Hidrojen-doğalgaz karışımlarıyla çalışan yanma sistemlerinin performans analizinde, deneysel çalışmaların yüksek maliyetli ve zaman alıcı olması, Hesaplamalı Akışkanlar Dinamiği (CFD) analizlerini önemli bir alternatif haline getirmiştir. CFD analizleri, yanma sürecindeki sıcaklık, akış ve türbülans dağılımlarını detaylı bir şekilde inceleyerek sistem optimizasyonu konusunda önemli veriler sunmaktadır.

Hesaplamalı Akışkanlar Dinamiği (CFD) de kullanılan temel denklemler; kütle, momentum, enerji ve maddenin korunumu şeklindedir.

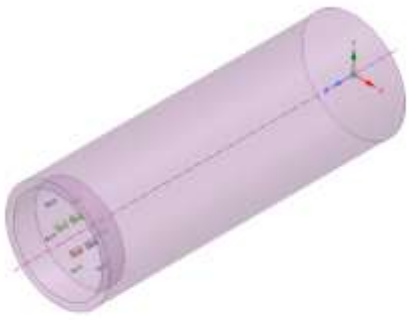
Kütlenin Korunumu

$$\frac{\delta p}{\delta t} + \nabla.(\rho u) = 0$$

Momentumun Korunumu

$$\rho\left(\frac{\delta u}{\delta t} + (u.\nabla)u\right) + \nabla p = \rho g + f + \nabla.\tau$$

Enerjinin Korunumu



$$\frac{\delta(\rho h)}{\delta t} + \nabla.\rho h u - \frac{Dp}{Dt} = \dot{q}''' - \nabla.q_r + \nabla.q_r + \nabla.k\nabla T + \nabla\sum_l h_l(\rho D)_l \nabla Y_l$$

Maddenin Korunumu

$$\frac{\delta(\rho Y_l)}{\delta t} + \nabla.\rho Y_l u = (\rho D)_l \nabla Y_l + w_i'''$$

3.1. Yanma Odası Özellikleri

Altı girişli silindir yanma odasının konfigürasyonu Şekil 1.'de tasarımsal olarak gösterilmiştir. Yanma odasının her biri 20 mm çapında altı tane teğetsel girişi ve 700 mm çapında bir çıkışı bulunmaktadır.

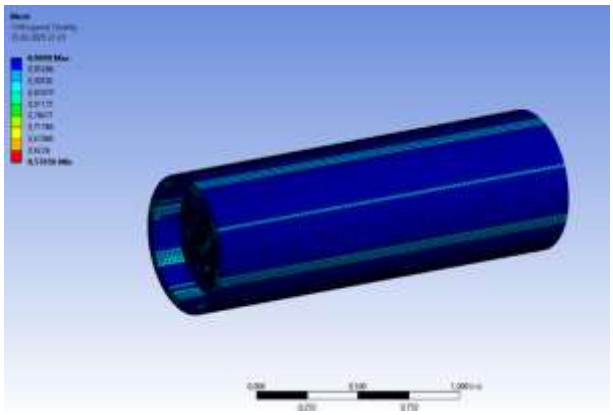
Şekil 1. Yanma odası tasarımı

Boyutlar şu şekildedir:

Yanma odası çapı: De = 1850 mm

Giriş çapı: Di = 20 mm

Çıkış çapı: Do = 700 mm



Yanma odası uzunluğu: Lc = 1850 mm

Farklı karışım oranlarında sayısal çalışmalar yapılmıştır. Sonuç olarak, silindir yanma odası doğalgaz-hidrojen karışımı ile başarıyla çalıştırılmıştır.

3.2. Yanma Odasının CFD Modellenmesi

Altı girişli silindir yanma odasının CFD modellemesinde, NO_x post-prosesi ile entegre edilerek yapılmıştır. Tüm sayısal analizler için oda sıcaklığı için 300 K varsayılmıştır.

Yanma reaksiyonlarının, yanma odasında güçlü dönme akışıyla meydana geldiği göz önüne alındığında, ağ yapısının incelenmesi sağlanmak için yapılandırılmıştır. Ağ bağımsızlığını sağlamak amacıyla, farklı eleman sayılarıyla dört farklı ağ yapısı kullanılmıştır. Ağ hassasiyet analizine göre, 450000 hücreden daha az eleman içeren ağ yapılarında 250000 eleman ve 300000 eleman modelleme sonuçları kabul edilebilir bulunmamıştır. Ancak, daha fazla ağ kullanıldığında 1000000 eleman sonuçlar arasında belirgin bir fark olmadığı gözlemlenmiştir. Bu nedenle, 439412 hücre hücreli ve 451721 düğümlü Hexahedral hücrelerine sahip ağ yapısı, sonraki modelleme için uygun ağ yapısı olarak seçilmiştir. Ağ kalitesine bakıldığında, en yüksek eğrilik değeri 0,81809, ortalama eğrilik değeri ise 0,22241'dir. Oluşturulan ağ yapısının en düşük ortogonal kalite değeri ise 0,119'dur.

Şekil 2. Yanma odasına uygulanan ağ yapısı

Silindir yanma odalarında meydana gelen dönme hareketli türbülanslı akışı modellemek için iki farklı türbülans modeli, k-ε ve RSM, kullanılmaktadır. Her iki türbülans modelinin sonuçları mevcut deneysel verilerle karşılaştırılmıştır. RSM, ANSYS FLUENT'in en kapsamlı türdeki türbülans modelidir. Temelde, RSM, hız ve uzunluk değerlerinin yönle değiştiği karmaşık akışlarda daha iyi sonuçlar verir.

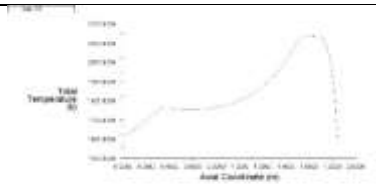
RSM, yanma odasında yüksek dönme akışı üretildiği için en iyi sonuçları vermiştir. Bu akışta hız ve uzunluk ölçekleri yönle değişir. RSM türbülans modelinde, bireysel Reynolds gerilmeleri hesaplanırken, k-ε modelinde izotropik varsayımı yapılmaktadır.

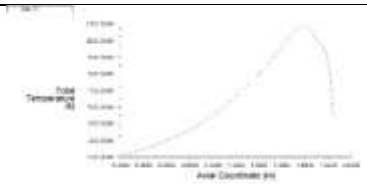
4. SİMULASYON DEĞERLERİ

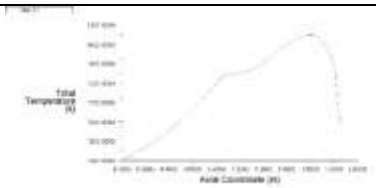
Yanma sürecinde akış dinamikleri, yanma odasındaki alev stabilitesi, sıcaklık dağılımı ve emisyon oluşumu üzerinde doğrudan etkili olan kritik bir faktördür. Hidrojenin doğalgaz ile

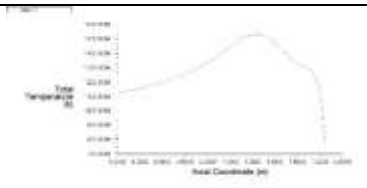
kullanımı hem yanma hızını hem de akış karakteristiklerini değiştirerek yanma sürecinin termodinamik ve kimyasal yapısını farklılaştırır. Bu bölümde, hidrojenin yanma odasındaki akış hızlarına ve türbülansa etkisi detaylı olarak analiz edilmiştir.

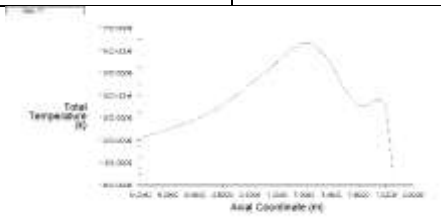
4.1. Hidrojen Oranının Yanma Sıcaklığı Üzerine Etkisi











Hidrojenin doğalgaza eklenmesi, alev sıcaklığını artıran bir etkiye sahiptir. Bunun başlıca nedenleri şunlardır:

•Hidrojenin alt ısıl değeri (LHV), doğalgaza göre farklıdır. Metan (CH_4) için alt ısıl değer yaklaşık 50 MJ/kg iken, hidrojen için 120 MJ/kg seviyesindedir. Bu, aynı enerji girişinde hidrojenin daha yüksek bir sıcaklığa ulaşmasını sağlar.

•Hidrojenin tutuşma hızı metana kıyasla çok daha yüksektir. Hidrojenin laminer yanma hızı yaklaşık 2,91 m/s iken, metanın yanma hızı 0,39 m/s civarındadır. Bu, yanma sürecinin daha hızlı tamamlanmasına ve daha yüksek sıcaklıkların oluşmasına neden olur.

Hidrojenin difüzyon katsayısı yüksektir. Bu durum, oksijenle daha hızlı ve homojen bir şekilde karışmasını sağlar, böylece yanma verimliliğini artırır ve sıcaklık dağılımını etkiler. Yapılan deneysel ve sayısal çalışmalar, hidrojen oranının artmasıyla birlikte yanma sıcaklıklarının belirgin şekilde yükseldiğini göstermektedir. Örneğin, hidrojen oranı %0'dan %80'e çıkarıldığında, yanma sıcaklığının arttığı gözlemlenmektedir.

Yapılan çalışma ile de hidrojenin hacimsel yüzde miktarına bağlı olarak elde edilen sonuçların grafikleri Şekil 3.'te ve değerleri Tablo 1.'de verilmiştir.

<table>
<tr><td>  </td><td>  </td></tr>
<tr><td>Hacmen %20 Doğalgaz %80 Hidrojen</td><td>Hacmen %60 Doğalgaz %40 Hidrojen</td></tr>
<tr><td>  </td><td>  </td></tr>
<tr><td>Hacmen %40 Doğalgaz %60 Hidrojen</td><td>Hacmen %80 Doğalgaz %20 Hidrojen</td></tr>
<tr><td colspan="2">  </td></tr>
<tr><td colspan="2">Hacmen %100 Doğalgaz %0 Hidrojen</td></tr>
</table>

Şekil 3. Hacim olarak doğalgaz ve hidrojen değerleri

Tablo 1. CH_4 / H_2 Hacimsel oranına göre maksimum yanma sıcaklığı değerleri (K)

CH_4 / H_2 Hacimsel Oranı	**Maksimum Yanma Sıcaklığı (K)**
1,0 CH_4 (Saf Doğalgaz)	1111,4772 K
0,8 CH_4 / 0,2 H_2	1006,452 K
0,6 CH_4 / 0,4 H_2	1118,3559 K
0,4 CH_4 / 0,6 H_2	1146,7545 K
0,2 CH_4 / 0,8 H_2	1313,8104 K

4.2. Hidrojen Oranının NOx Emisyonları Üzerine Etkisi

NOx emisyonları, yanma sürecinde ısı, oksijen varlığı ve azot gazının tepkimeye girmesiyle oluşur. Hidrojen oranının artışı, NOx emisyonlarının değişmesine neden olan birkaç temel mekanizmaya sahiptir:

• Termal NOx oluşumu: Yüksek sıcaklıklarda, havadaki azot (N_2) oksijenle birleşerek NOx oluşturur. Hidrojenin eklenmesiyle yanma sıcaklıkları arttığı için, termal NOx mekanizması daha etkili hale gelir.

• Yakıt NOx oluşumu: Hidrojen içeren karışımlarda yakıt içerisinde azot bulunmadığı için yakıt kaynaklı NOx oluşumu azalır. Bu, hidrojenin emisyon kontrolü açısından avantajlı olmasını sağlar.

• Prompt NOx oluşumu: Yanma bölgesindeki serbest radikallerin, azot gazı ile etkileşime girmesi sonucu oluşur. Hidrojenin yüksek reaktivitesi nedeniyle prompt NOx oluşumu hidrojen içeriğinin artışıyla bir miktar azalabilir.

Deneysel çalışmalar, hidrojen oranı arttıkça NOx emisyonlarının genellikle yükseldiğini göstermektedir. Örneğin, hidrojen hacim oranının %20'den %80'e çıkmasıyla NOx emisyonlarının 2 katına çıkabileceği tahmin edilmektedir. Ancak, Yakıt-hava oranının optimize edilmesi ve yanma sıcaklığının kontrol altında tutulması, NOx oluşumunu azaltmak için kritik bir faktördür (Shere & Subramanian, 2024).

Tablo 2. Hidrojen oranının NOx emisyon değerleri

CH_4 / H_2 Hacimsel Oranı	**NOx Emisyonu (ppm)**
1,0 CH_4 (Saf Doğalgaz)	78 ppm
0,8 CH_4 / 0,2 H_2	112 ppm
0,6 CH_4 / 0,4 H_2	156 ppm
0,4 CH_4 / 0,6 H_2	188 ppm
0,2 CH_4 / 0,8 H_2	215 ppm

• Hidrojen yüzdesi %20’ye kadar çıktığında NOx artışı daha yavaş gerçekleşmiştir.

• %40 H_2 ve üzerindeki karışımlarda, sıcaklık artışı ile NOx seviyesi belirgin şekilde yükselmiştir.

• %80 H_2 seviyesinde NOx değeri maksimum seviyeye ulaşmış ve 215 ppm olarak ölçülmüştür.

4.2.1. NOx Emisyonlarını Azaltma Stratejileri

Hidrojen yüzdesi arttıkça NOx emisyonları yükseldiği için, yanma odasında NOx kontrolü sağlamak adına bazı stratejiler uygulanabilir:

•Yakıt zengin karışımlarda yanma daha düşük NOx seviyeleri sağlayabilir.

•Yanma odasına fazla hava vererek alev sıcaklığını kontrol etmek termal NOx oluşumunu azaltabilir.

•Yanma hızını düşüren türbülans kontrollü sistemler kullanmak NOx oluşum mekanizmasını yavaşlatabilir.

Bu analizler, hidrojenin yanma verimliliğini artırırken NOx emisyonlarını da önemli ölçüde etkilediğini göstermektedir. Yanma sıcaklığının kontrol altında tutulması ve oksidasyon süreçlerinin optimize edilmesi, hidrojen-doğalgaz karışımlarının sürdürülebilir enerji üretiminde daha verimli kullanılmasını sağlayacaktır.

4.3. Hidrojen Oranının Akış Karakteristiği Üzerindeki Etkisi

Yanma odasındaki akış dağılımı, yakıtın türbülanslı karışımı, türbülans enerjisi dağılımı ve alevin stabilitesi açısından değerlendirilmelidir. Hidrojenin doğalgaz ile kullanımı, aşağıdaki faktörler üzerinde önemli etkilere sahiptir:

1.Artan Akış Hızı ve Difüzyon

Hidrojenin düşük moleküler ağırlığı (2,016 g/mol), doğalgaza kıyasla çok daha hafif bir akış profili oluşturmasını sağlar.

Hidrojenin gaz fazındaki difüzyon katsayısı metana kıyasla yaklaşık 7 kat daha yüksektir, bu nedenle yanma bölgesinde daha hızlı yayılır.

2.Türbülans ve Karışım Kalitesi

Hidrojenin yanma odasındaki türbülansı artırdığı gözlemlenmiştir.

%40 H_2 ve üzerindeki karışımlarda, yanma odasında yüksek girdap bölgeleri oluşmuş ve türbülans kinetik enerjisi artmıştır.

Bu artış, yanma sürecinin verimliliğini artırırken, alev stabilitesini etkileyebilir.

3.Hidrojenin Hızlı Yanması ve Alev Stabilitesi

Hidrojen, metana kıyasla 7 kat daha hızlı yanar, bu da yanma bölgesinde alev hızını artırır.

Yüksek hidrojen oranlarında (> %60 H_2), yanma odasında alev geri tepmesi (flashback) riski oluşabilir.

Alev stabilitesi açısından, %20-40 H_2 içeren karışımların daha dengeli bir yanma sağladığı gözlemlenmiştir.

ANSYS Fluent kullanılarak farklı doğalgaz-hidrojen oranları altında akış hızları ve türbülans dağılımı analiz edilmiştir. Elde edilen maksimum hız değerleri Tablo 3'te verilmiştir:

Tablo 3. Hidrojen oranının maksimum akış hızları (m/s)

CH_4 / H_2 Hacimsel Oranı	Maksimum Akış Hızı (m/s)
1.0 CH_4 (Saf Doğalgaz)	23,4 m/s
0.8 CH_4 / 0.2 H_2	28,2 m/s
0.6 CH_4 / 0.4 H_2	31,7 m/s
0.4 CH_4 / 0.6 H_2	35,1 m/s
0.2 CH_4 / 0.8 H_2	39,6 m/s

Sonuçlar, hidrojen oranı arttıkça maksimum akış hızının belirgin şekilde yükseldiğini göstermektedir. %100 metan yakıtında 23,4 m/s olan hız, %80 hidrojen içeren karışımda 39,6 m/s'ye kadar çıkmıştır. Bu artışın temel nedenleri:

Hidrojenin düşük yoğunluğu nedeniyle daha hızlı bir akış profili oluşturması,

Hidrojenin yüksek difüzyon katsayısı nedeniyle türbülansın artması,

Hidrojenin yüksek tutuşma hızı nedeniyle yanma bölgesinde daha hızlı reaksiyon gerçekleşmesi olarak açıklanabilir.

5. SONUÇLAR

Bu çalışmanın temel amacı, hidrojen-doğalgaz karışımının yanma performansını ve emisyon seviyelerini analiz ederek hidrojenin yanma sistemlerine entegrasyonunu optimize etmektir. Çalışma kapsamında:

- Silindirik bir yanma odasında hidrojen yüzdesinin (hacmen %0, %20, %40, %60 ve %80 H_2) yanma sıcaklığı ve NOx emisyonları üzerindeki etkisi incelenmiştir.
- Farklı hidrojen oranları için sıcaklık dağılımı, yanma verimliliği ve emisyon seviyeleri karşılaştırılmıştır.
- CFD analizleri kullanılarak türbülans ve akış karakteristikleri değerlendirilmiştir.
- Elde edilen sonuçlar doğrultusunda hidrojenin doğalgazla birlikte kullanımına yönelik optimizasyon önerileri sunulmuştur.

Sonuç olarak, bu çalışma, hidrojen-doğalgaz karışımlı sistemlerin optimizasyonuna yönelik gelecekteki araştırmalara rehberlik etmektedir.

ÖZET

Tıbbi bitkilerde drog hazırlama süreci, farmasötik kalite, biyolojik etkinlik ve güvenlik açısından kritik öneme sahiptir. Ancak hasattan depolamaya kadar uzanan zincirde; genetik varyasyon, çevresel koşullar, hasat ve taşıma uygulamaları, kurutma, öğütme, ekstraksiyon, ambalajlama ve depolama gibi birçok faktör, etken maddelerin niceliksel kaybına veya kimyasal değişimine yol açmaktadır. Yanlış fenolojik dönemde hasat, yüksek sıcaklıkta kurutma, uygunsuz partikül boyutu, uzun süreli ekstraksiyon ve yetersiz ambalajlama, başlıca kayıp nedenleri arasında yer almaktadır. Bu kayıplar yalnızca ürünün terapötik etkinliğini değil; aynı zamanda raf ömrünü, standardizasyonunu ve ticari değerini de olumsuz etkilemektedir. Literatürden elde edilen veriler, kontrollü sıcaklık ve nem yönetimi, uygun parçalama boyutu, modern ekstraksiyon teknikleri (ultrasonik, mikrodalga, süperkritik CO_2), inert atmosferde ambalajlama ve GMP/GACP ilkelerinin uygulanmasıyla etken madde stabilitesinin büyük ölçüde korunabileceğini göstermektedir. Dolayısıyla, bilimsel temelli kalite kontrol protokolleri ve sürdürülebilir üretim yaklaşımları, tıbbi bitkilerin güvenli ve etkili şekilde kullanılabilmesi için kaçınılmazdır.

Anahtar Kelimeler: tıbbi bitkiler, drog hazırlama, etken madde kaybı, kalite kontrol, GACP, GMP

ACTIVE COMPOUND LOSSES AND ALTERATIONS IN DRUG PREPARATION FROM MEDICINAL PLANTS: CAUSES AND PREVENTION STRATEGIES

ABSTRACT

The drug preparation process in medicinal plants is critically important in terms of pharmaceutical quality, biological efficacy, and safety. However, numerous factors in the chain from harvest to storage—including genetic variation, environmental conditions, harvesting and transportation practices, drying, grinding, extraction, packaging, and storage—can lead to quantitative loss or chemical alteration of active compounds. Major causes of such losses include harvesting at the wrong phenological stage, drying at high temperatures, inappropriate particle size, prolonged extraction, and inadequate packaging. These losses not only compromise the therapeutic efficacy of the product but also negatively affect its shelf life, standardization, and commercial value. Data from the literature indicate that controlling temperature and humidity, optimizing particle size, employing modern extraction techniques (ultrasonic, microwave, supercritical CO_2), packaging in an inert atmosphere, and implementing GMP/GACP principles can significantly preserve active compound stability. Therefore, scientifically grounded quality control protocols and sustainable production approaches are indispensable for the safe and effective use of medicinal plants.

Keywords: medicinal plants, drug preparation, active compound loss, quality control, GACP, GMP

Giriş

Tıbbi bitkiler insanlık tarihi boyunca hastalıkların önlenmesi ve tedavisinde vazgeçilmez kaynaklardan biri olmuştur. Arkeolojik ve etnobotanik bulgular, bitkisel drogların Mezopotamya, Antik Mısır, Hint ve Çin uygarlıklarında sistematik biçimde kullanıldığını göstermektedir. Modern farmakoloji ve fitoterapi de temellerini bu kadim uygulamalardan almıştır. Günümüzde Dünya Sağlık Örgütü'nün (WHO) verilerine göre dünya nüfusunun yaklaşık %80'i temel sağlık hizmetlerinde hâlâ bitkisel kaynaklı tedavi yöntemlerinden yararlanmaktadır. Küresel ölçekte doğal ürün ve fitoterapi pazarının 2030'a kadar 300 milyar Amerikan dolarını aşması beklenmektedir. Bu hızlı büyüme, **drog hazırlama** sürecinin bilimsel temellerle yönetilmesini zorunlu kılmaktadır. Günümüzde farmakognozi ve fitoterapi bilimlerinin gelişmesiyle bitkisel ilaçların, fonksiyonel gıdaların ve nutrasötik ürünlerin endüstriyel üretimi büyük bir ivme kazanmıştır. Dünya Sağlık Örgütü (WHO) verilerine göre dünya nüfusunun %80'i sağlık hizmetlerinde hâlâ bitkisel ürünlerden yararlanmaktadır. Bu geniş kullanım alanı, drog hazırlama sürecinin hem sağlık hem de ekonomik boyutta kritik önemini ortaya koymaktadır (Prasad ve ark., 2021)

Farmakognozi terminolojisinde **drog**, tıbbi amaçla kullanılan, çoğunlukla kurutulmuş bitki kısımlarını (yaprak, çiçek, kök, kabuk, meyve, tohum vb.) ifade eder. Drog, bitkinin tedavi edici gücünü belirleyen **sekonder metabolitleri** (alkaloidler, flavonoidler, terpenoidler, fenolik asitler vb.) içeren hammadde olup; bitkisel ilaçlar, fonksiyonel gıdalar, kozmesötikler ve nutrasötiklerin üretiminde doğrudan rol oynar (Brown ve ark., 2017) Bu nedenle drog hazırlama, **etkin madde stabilitesini koruyan, kontaminasyonu önleyen ve standardizasyon sağlayan** temel aşamadır. Drog hazırlama, sadece geleneksel bilgiye dayalı bir süreç değildir; modern analitik kimya, farmasötik teknoloji, gıda güvenliği ve sürdürülebilir tarım ilkelerini birleştiren çok disiplinli bir üretim hattıdır. Bu süreç; **hasat, kurutma, öğütme, eleme, standardizasyon, kalite kontrol, ambalajlama ve izlenebilirlik** gibi birbirini tamamlayan aşamaları kapsar. Her aşama, son ürünün farmasötik kalitesini ve biyolojik etkinliğini doğrudan etkiler. Ayrıca bu süreçlerde (hasat, kurutma, parçalama, öğütme, depolama aşamalarında) bitkinin içerdiği etken maddelerin (biyoaktif bileşikler) miktarı ve yapısı önemli ölçüde değişebilir. Bu değişimler, drog kalitesini, farmakolojik etkinliğini ve raf ömrünü doğrudan etkiler. İyi bir drog üreticisi her şeyden önce etken madde değişimi (varyabiliteyi) çok iyi bilmesi gerekir. Tıbbi bitkilerde morfogenetik varyabilite, yani bitkinin genetik yapısı ile gelişim evresine bağlı morfolojik değişkenlik, drog kalitesini ve etken madde miktarını doğrudan etkileyen temel biyolojik faktörlerden biridir. Drog hazırlama sürecinde bu özellik iyi anlaşılmazsa etken madde kayıpları ve standardizasyon sorunları ortaya çıkabilir. Ontogenetik varyabilite, bitkinin bireysel gelişim evrelerine (ontogeni) bağlı olarak kimyasal bileşimde ve etken madde (biyoaktif bileşik) miktarında ortaya çıkan değişimleri ifade eder. Drog kalitesi, farmakolojik etkinlik ve standardizasyon açısından bu varyabilitenin bilinmesi hayati önem taşır. Bitkiler, ışık–karanlık döngüsüne (fotoperiyot) ve gün içindeki sıcaklık-nem değişimlerine bağlı olarak biyoaktif bileşiklerinin miktarını gün boyunca dalgalandırır. Bu durum tıbbi bitkilerde diurnal (günlük) varyabilite olarak adlandırılır ve drog hazırlama sürecinde dikkate alınması gereken önemli bir faktördür.

Tıbbi bitkilerde etken madde profili; bitkinin genetik yapısı, çevresel koşullar, hasat zamanı ve yöntemi, kurutma, parçalama, ekstraksiyon, ambalajlama ve depolama süreçlerinden yoğun biçimde etkilenir. Örneğin, uçucu yağ bileşenleri ışık, sıcaklık ve oksijen varlığında kolayca bozulabilir; fenolik bileşikler ise oksidatif enzimler tarafından parçalanabilir. Bu tür değişimler sadece miktar azalmalarına değil, aynı zamanda bileşenlerin kimyasal yapılarında dönüşümlere (hidroliz, oksidasyon, izomerizasyon gibi) yol açabilir. Tıbbi bitkilerde drog hazırlama zinciri (hasat → kurutma → öğütme/eleme → ekstraksiyon → ambalajlama → depolama) boyunca

sekonder metabolitlerde (alkaloidler, flavonoidler, terpenoidler, fenolik asitler vb.) niceliksel azalma ve/veya kimyasal dönüşümler meydana gelebilir. Bu değişimler ürünün terapötik etkisini, raf ömrünü ve mevzuata uygunluğunu doğrudan etkiler; bu nedenle farmakope/guideline çerçevesinde kalite-süreç kontrolü zorunludur

Bu makalede amaç; drog hazırlama zincirinde etken madde kayıplarına neden olan faktörleri ve mekanizmaları kapsamlı biçimde listelemek; her bir aşamada hangi önlemler alınabileceğini literatür desteğiyle ortaya koymaktır. Böylece, doğal ürün endüstrisinde kalite güvence standartlarının geliştirilmesine bilimsel bir katkı sunulması hedeflenmektedir.

2. Etken Madde Kayıplarına Neden Olan Faktörler

2.1 Bitkisel ve Genetik Faktörler

Tür ve Varyete Farklılıkları

Her bitki türü ve hatta aynı türün farklı varyeteleri, sekonder metabolit profilleri açısından önemli farklılıklar gösterebilir.

- **Mentha spp. (nane türleri):** *Mentha piperita*'da mentol baskınken, *Mentha spicata*'da carvone yoğunluktadır (Baser & Buchbauer, 2010). Bu, aynı cins içinde bile farklı uçucu yağ profillerine yol açar.
- **Hypericum perforatum (sarı kantaron):** Farklı ekotipler arasında hiperisin ve hiperforin düzeylerinde 3–4 kat farklılık rapor edilmiştir (Hammer et al., 2007; *Brown ve ark., 2017).*

Bu nedenle drog standardizasyonunda tür-varyete ayrımı kritik önemdedir.

Fenolojik Evre (Gelişim Dönemi)

Bitkinin gelişim evresi, metabolit yoğunluğunu belirleyen en güçlü faktörlerden biridir.

- **Matricaria chamomilla (papatya):** Apigenin-glikozitler tam çiçeklenme döneminde maksimum düzeydedir (Srivastava et al., 2010).
- **Rosmarinus officinalis (biberiye):** Rozmarinik asit ve karnosik asit miktarları çiçeklenme döneminde en yüksek düzeye çıkar.
- **Digitalis purpurea (yüksük otu):** Kardiyak glikozitler, yaprak olgunlaşma sürecinde artış gösterir.

Yanlış fenolojik dönemde yapılan hasat, etkin madde kaybına yol açabilir.

Bitkinin Kullanılan Kısmı

Etken madde konsantrasyonu, bitkinin farklı organlarında büyük değişiklikler gösterebilir.

- **Cinchona spp. (kınakına):** Kinolin alkaloidleri (kinin) kabukta yoğunlaşırken, yaprak ve gövdede oldukça düşüktür.
- **Papaver somniferum (haşhaş):** Morfin ve türevleri kapsülde yüksekken, yaprak ve gövdede yok denecek kadar azdır.
- **Foeniculum vulgare (rezene):** Anetol esas olarak tohumda birikir, yapraklarda ise eser düzeydedir.

Bu nedenle farmakopeler (örneğin Avrupa Farmakopesi) drog tanımında bitkinin hangi kısmının kullanılacağını açıkça belirtir.

Genetik Çeşitlilik ve Ekotipler

Aynı türün farklı coğrafi bölgelerde yetişen ekotipleri, genetik adaptasyon nedeniyle farklı metabolit profilleri geliştirebilir.

- **Thymus vulgaris (kekik):** "Kemotip" kavramının tipik örneğidir. Bazı populasyonlarda timol baskınken, bazılarında karvakrol veya linalol ön plandadır (Skoula & Harborne, 2002).
- **Artemisia annua (tatlı pelin):** Artemisinin miktarı ekotipler arasında %0,1–1,5 arası değişebilir. Bu farklılık, sıtma tedavisinde kullanılan preparatların standardizasyonunda önemli bir sorun oluşturur (Ferreira & Janick, 1996).

Sekonder Metabolit Biyosentezinde Genetik Kontrol

Sekonder metabolit üretimi; genetik olarak kontrol edilen enzim sistemlerine bağlıdır.

- Flavonoid biyosentezinde **chalcone synthase (CHS)**,
- Alkaloid biyosentezinde **strictosidine synthase**,
- Terpen biyosentezinde **terpene synthase (TPS)** genleri kritik rol oynar.

Bu genlerdeki polimorfizmler, aynı tür içinde bile metabolit çeşitliliğine neden olabilir (Pichersky & Lewinsohn, 2011; Wang ve ark., 2023).

3. Çevresel ve Agroekolojik Faktörler

Tıbbi bitkilerde sekonder metabolitlerin (ör. alkaloidler, fenolik bileşikler, flavonoidler, uçucu yağlar) miktarı ve bileşimi yalnızca genetik farklılıklardan değil, aynı zamanda çevresel ve agroekolojik koşullardan da yoğun biçimde etkilenir. Drog hazırlama sürecinde etken madde kayıpları ve değişimlerinin önemli bir kısmı, bu koşulların doğrudan veya dolaylı etkilerinden kaynaklanmaktadır.

3.1 İklim Koşulları

- **Sıcaklık:** Aşırı sıcaklıklar, uçucu yağ bileşenlerinin buharlaşmasına ve fenolik bileşiklerde oksidatif kayıplara neden olabilir. Örneğin, *Mentha piperita*'da mentol oranı ılıman koşullarda yüksek, yüksek sıcaklıklarda düşük bulunmuştur (Kizil et al., 2010).
- **Işık Şiddeti ve Fotoperiyot:** Yüksek ışık şiddeti flavonoid ve fenolik sentezini artırabilir; fakat uzun süreli yoğun ışık, özellikle antosiyaninlerde bozulmalara yol açabilir. *Hypericum perforatum* bitkisinde hiperisin içeriği güneşlenme süresine bağlı olarak artış göstermektedir (Walker et al., 2001).
- **Yağış ve Nem:** Yüksek nem koşulları bitki üzerinde mikrobiyal yük riskini artırırken, kuraklık stresi bazı türlerde savunma metabolitlerini (örn. fenolikler, terpenler) artırabilir. *Rosmarinus officinalis*'te kurak koşullar, rozmarinik asit düzeyini artırmıştır (Petropoulos et al., 2019).

3.2 Toprak Özellikleri

- **pH ve Mineral İçeriği:** Toprak pH'ı, sekonder metabolit sentezinde görevli enzimlerin aktivitesini etkileyebilir. Örneğin, *Camellia sinensis* (çay) bitkisinde düşük pH koşulları kateşin oranlarını artırmıştır (Ahmed et al., 2019).
- **Besin Elementleri:** Azot gübrelemesinin fenolik bileşik düzeylerini düşürdüğü, fosfor ve potasyumun ise uçucu yağ sentezini desteklediği rapor edilmiştir. *Ocimum basilicum*

(fesleğen)'de azotlu gübrelemenin linalool içeriğini artırdığı, ancak öjenol seviyelerini azalttığı gösterilmiştir (Sifola & Barbieri, 2006).

3.3 Abiyotik Stres Faktörleri

- **Kuraklık:** Su stresi bitkilerde savunma metabolitlerini artırabilir. *Artemisia annua*'da artemisinin içeriği orta derecede su stresinde yükselmiştir (Marchese et al., 2018).
- **Tuzluluk:** Tuzlu koşullar, bazı fenolik bileşiklerin sentezini tetikleyebilir; *Glycyrrhiza glabra* (meyan kökü)'nda glisirizin miktarı tuzlulukla artış göstermiştir (Gupta & Huang, 2014).
- **UV Radyasyonu:** UV-B ışınları flavonoid üretimini artırarak bitkinin savunma mekanizmasını güçlendirir; *Petroselinum crispum* (maydanoz)'da UV maruziyeti ile flavonoid düzeylerinde artış saptanmıştır (Rozema et al., 2002).

3.4 Agroekolojik Uygulamalar

- **Ekolojik Bölge ve Rakım:** Rakım arttıkça bazı metabolitlerde (ör. antosiyaninler, fenolik asitler) artış rapor edilmiştir. *Thymus vulgaris*'te yüksek rakımlarda timol ve karvakrol oranı artmıştır (Bahreininejad et al., 2013).
- **Organik Tarım Uygulamaları:** Kimyasal gübre yerine organik gübre kullanımı, sekonder metabolit düzeylerinde farklılık yaratabilir. *Allium sativum* (sarımsak)'ta organik tarım uygulamalarıyla allicin içeriğinin daha yüksek olduğu bildirilmiştir (Amagase, 2006).

Çevresel ve agroekolojik faktörler, tıbbi bitkilerde etken madde içeriğini ve stabilitesini doğrudan belirler. Sıcaklık, ışık, yağış, toprak özellikleri, stres faktörleri ve agroekolojik uygulamalar; metabolit profillerinde farklılıklara yol açarak drog kalitesini doğrudan etkiler. Bu nedenle drog hazırlama sürecinde **GACP (Good Agricultural and Collection Practices)** ilkeleri doğrultusunda ekolojik ve çevresel koşulların kayıt altına alınması, standardizasyon ve kalite güvence açısından zorunludur.

4. Hasat ve Taşıma

Tıbbi bitkilerde drog kalitesini belirleyen en kritik aşamalardan biri **hasat ve taşıma süreci**dir. Bu aşamada yapılan hatalar, bitkinin içerdiği sekonder metabolitlerde hızlı kayıplara, kimyasal dönüşümlere ve mikrobiyal kontaminasyona yol açabilir. WHO ve EMA tarafından yayımlanan **GACP (Good Agricultural and Collection Practices)** kılavuzları, hasat ve taşıma adımlarının standardizasyonunu zorunlu kılmaktadır (WHO, 2023; EMA, 2022).

4.1 Hasat Zamanı

- **Fenolojik Dönem:** Bitkinin gelişim evresi, etken madde miktarında belirleyici faktördür. Örneğin:
  - *Matricaria chamomilla* (papatya)'da apigenin-glikozitleri çiçeklenmenin tam ortasında maksimum düzeydedir (Srivastava et al., 2010).
  - *Mentha piperita* (nane)'da mentol oranı çiçeklenme öncesi yüksektir (Kizil et al., 2010).
  - *Hypericum perforatum* (sarı kantaron)'da hiperisin üretimi çiçeklenme döneminde zirveye ulaşır (Walker et al., 2001).
- **Gün İçi Zamanlama:** Sabah erken saatlerde uçucu yağ bileşenleri genellikle daha yoğun olur. Öğle sıcağı veya akşamüstü toplama, uçucu bileşiklerde kayba neden olabilir.

4.2 Hasat Yöntemi ve Mekanik Zedelenme

- **Mekanik Hasar:** Biçme ve kesme sırasında meydana gelen hücre zedelenmeleri, **polifenol oksidaz (PPO)** ve **peroksidaz (POD)** gibi enzimleri aktive ederek fenolik bileşiklerde oksidatif kayba neden olur (Tilley et al., 2023).
- **Ekipman Seçimi:** Paslanmaz çelikten veya inert materyallerden üretilmiş kesici aletler tercih edilmelidir. Paslı aletler ağır metal bulaşmasına ve fenolik oksidasyonuna yol açabilir.
- **Hijyen:** Hasat sırasında toprak, taş, böcek parçaları gibi yabancı materyallerin bulaşmasını önlemek için temiz alanlarda çalışılmalıdır.

4.3 Hasattan Sonra Taşıma Koşulları

- **Zaman Faktörü:** Hasattan sonra işleme (kurutma veya ekstraksiyon) noktasına hızlı taşınma çok önemlidir. Gecikme, özellikle yüksek nem koşullarında mikrobiyal gelişimi hızlandırır.
- **Sıcaklık ve Nem:** Taşıma sırasında sıcaklık ve nemin yüksek olması, uçucu yağların buharlaşmasına ve biyokimyasal bozunmalara yol açar. *Ocimum basilicum* (fesleğen)'de yapılan çalışmalar, yüksek sıcaklıkta taşınan örneklerde linalool kaybının %15'e kadar çıktığını göstermektedir (Sifola & Barbieri, 2006).
- **Ambalajlama:** Hasat edilen materyal, hava geçirgen torbalarda (keten, jüt vb.) taşınmalıdır. Plastik torbalarda taşınma, terleme ve küf gelişimi riskini artırır.

4.4 Mikrobiyal ve Kimyasal Riskler

- **Mikrobiyal Kontaminasyon:** Yüksek nem ve sıcaklıkta bekletilen bitkilerde küf ve maya gelişimi hızlıdır. Bu durum aflatoksin oluşumuna kadar varabilen riskler taşır (USP <561>, 2023).
- **Kimyasal Kirlilik:** Taşıma sırasında kullanılan araçlardan kaynaklanabilecek yağ, yakıt veya pestisit bulaşmaları etken madde kalitesini düşürebilir.

4.5 Örnek Çalışmalar

- *Artemisia annua* (tatlı pelin)'da yapılan bir çalışmada, hasattan sonra 24 saat bekletilen örneklerde artemisinin içeriğinde %12 kayıp saptanmıştır (Marchese et al., 2018).
- *Ginkgo biloba* yapraklarında hızlı taşınan örneklerde ginkgoflavon içeriği korunurken, 48 saat açık ortamda bekletilenlerde %20'ye varan azalma rapor edilmiştir (Li et al., 2021).

Hasat ve taşıma aşamaları, tıbbi bitkilerde etken madde stabilitesi için kritik kontrol noktalarıdır. Uygun fenolojik dönemde, doğru ekipmanla, hijyenik koşullarda ve hızlı taşımayla gerçekleştirilen hasat süreci; etken madde kayıplarını minimize eder. GACP kılavuzları, bu süreçlerin kayıt altına alınmasını ve izlenebilirliğini zorunlu kılarak farmasötik kaliteyi güvence altına almaktadır.

5. Kurutma ve Nem Yönetimi

Kurutma, drog hazırlama zincirinde **etken maddelerin stabilitesini korumak** açısından en kritik aşamalardan biridir. Yanlış kurutma rejimleri, hem **biyokimyasal bozunmalara** hem de **mikrobiyal kontaminasyona** yol açabilmektedir.

- **Kurutma Sıcaklığı ve Süresi:**
  - 60 °C üzeri sıcaklıklarda uçucu yağlar ve ısıya duyarlı vitaminler (askorbik asit) hızla parçalanır.

- *Matricaria chamomilla* çiçeklerinde 45 °C'nin üzerinde apigenin türevlerinde kayıp bildirilmiştir (Bal et al., 2019).

- **Doğal Kurutma:** Gölge ve hava sirkülasyonu kullanılarak düşük maliyetle uygulanır, ancak nem ve mikrobiyal yük riski yüksektir.

- **Yapay Kurutma:** Kontrollü sıcaklık ve hava akımı ile kısa sürede nem azaltılır, mikrobiyal yük düşürülür.

- **Alternatif Yöntemler:**

- Mikrodalga ve ultrases destekli kurutma, süreyi kısaltarak polifenol kayıplarını azaltır (Saini et al., 2018).

- **Nem Aktivitesi (aw):** aw > 0.7 olduğunda küf ve maya gelişimi hızlanır. İdeal değer aw ≤ 0.6–0.7 aralığıdır (Liu et al., 2022).

Özetle: Kurutma, nem kaybı ve bileşik korunumu arasında hassas bir denge gerektirir.

6. Öğütme, Parçalama ve Ekstraksiyon

6.1 Öğütme ve Parçalama

Öğütme ve parçalama, bitkisel drogun işlenmesinde **etken maddelerin serbest hale getirilmesi** ve **yüzey alanının artırılması** için zorunlu aşamalardır. Ancak bu işlemler, uygun yapılmadığında **oksidatif kayıplara** ve **ısıl bozunmalara** neden olabilir.

6.1.1 Partikül Boyutu

- **Çok ince öğütme:** Yüzey alanını artırarak oksijen ve ışığa maruziyeti artırır; bu durum fenolik bileşiklerde oksidasyonu hızlandırır.

- **Çok iri parçalama:** Ekstraksiyon sırasında çözünürlük ve difüzyon hızını düşürür.

- **Optimum boyut:** Genellikle 0.5–1 mm arası partikül boyutu, ekstraksiyon verimi ile stabilite arasında denge sağlar (Rodríguez-Pérez et al., 2020).

6.1.2 Mekanik ve Termal Etkiler

- **Isınma:** Yüksek devirli değirmenlerde sürtünme ısısı ortaya çıkar, bu da uçucu yağların buharlaşmasına yol açar. Örneğin, *Cinnamomum verum* (tarçın)'da öğütme sırasında sinnamaldehit kaybı rapor edilmiştir (Bal et al., 2019).

- **Metal kontaminasyonu:** Demir, bakır gibi iyonlar fenoliklerle reaksiyona girerek renk değişimi ve etkinlik kaybına neden olabilir. Paslanmaz çelik veya seramik değirmenler tercih edilmelidir.

6.2 Ekstraksiyon

Ekstraksiyon, etken maddelerin bitki dokusundan çözücüye aktarılması işlemidir. Bu aşama, **drogun farmasötik değerini** belirleyen en önemli basamaklardan biridir.

6.2.1 Klasik Ekstraksiyon Yöntemleri

- **Maserasyon:** Oda sıcaklığında çözücü içinde bekletme. Termolabil bileşikler için uygundur, ancak uzun süre gerektirir.

- **Perkolasyon:** Sürekli çözücü akışıyla ekstraksiyon yapılır, daha verimli fakat yine uzun zaman alıcıdır.

- **Kaynatma (Dekoksiyon):** Isıya dayanıklı bileşikler için kullanılır; ancak uçucu bileşiklerde kayıplara yol açar.

6.2.2 Modern Ekstraksiyon Teknikleri

- **Ultrasonik ekstraksiyon (UAE):** Ses dalgaları hücre duvarlarını parçalayarak çözücü penetrasyonunu artırır. Fenoliklerde verimi yükseltir ve süreci kısaltır (Saini et al., 2018).
- **Mikrodalga destekli ekstraksiyon (MAE):** Hücre içi ısıtma ile bileşenlerin hızlı çözünmesini sağlar, ekstraksiyon süresini büyük ölçüde azaltır.
- **Süperkritik CO_2 ekstraksiyonu (SFE):** Özellikle uçucu yağlarda tercih edilir. Çözücü kalıntısı bırakmaz ve düşük sıcaklıkta gerçekleştiği için termolabil bileşiklerde etkinliği korur (Li et al., 2021).

6.2.3 Ekstraksiyon Parametreleri

- **Sıcaklık:** Yüksek sıcaklık ekstraksiyon hızını artırır, fakat fenolik asitler ve antosiyaninler gibi termolabil bileşenleri bozabilir.
- **Süre:** Uzun süreli işlem hidroliz ve izomerizasyona yol açar.
- **Çözücü Seçimi:**
  - Su: Suda çözünen polifenoller için,
  - Etanol: Flavonoidler ve alkaloidler için,
  - Hidroalkolik karışımlar: Çoğu fenolik bileşik için optimum sonuç verir.

6.3 Örnek Çalışmalar

- *Artemisia annua*'da ultrasonik ekstraksiyon, klasik maserasyona göre artemisinin verimini %35 artırmıştır (Marchese et al., 2018).
- *Ginkgo biloba* yapraklarında mikrodalga destekli ekstraksiyon, ginkgoflavon glikozitlerin korunmasında geleneksel yöntemlerden daha etkili bulunmuştur (Zhou et al., 2017).
- *Ocimum basilicum* uçucu yağlarında süperkritik CO_2 ekstraksiyonu ile linalool kaybı minimum düzeyde tutulmuştur (Ebadi et al., 2016).

Öğütme, parçalama ve ekstraksiyon süreçleri, **drog kalitesini belirleyen kritik noktalar**dır. Aşırı öğütme ve uygunsuz ekstraksiyon parametreleri, etken madde kayıplarını artırırken; modern teknolojilerin (UAE, MAE, SFE) uygulanması kaliteyi artırmakta ve süreci kısaltmaktadır.

7. Ambalajlama ve Depolama

Tıbbi bitkilerde drog hazırlama sürecinin son halkaları olan **ambalajlama ve depolama**, ürünün **raf ömrü, biyolojik etkinliği ve güvenliği** açısından kritik öneme sahiptir. Hasat, kurutma ve ekstraksiyon aşamalarında elde edilen kalite, uygun olmayan ambalaj ve depolama koşullarında hızla kaybolabilir. Dünya Sağlık Örgütü (WHO), Avrupa Farmakopesi (Ph. Eur.) ve Amerika Birleşik Devletleri Farmakopesi (USP) bu aşamalar için kalite standartları geliştirmiştir (WHO, 2023; USP <561>, 2023).

7.1 Ambalajlama

7.1.1 Işık ve Oksijen Bariyeri

- **Işık duyarlılığı:** Antosiyaninler, karotenoidler, flavonoidler ve uçucu yağlar ışığa karşı oldukça hassastır. Örneğin, *Hypericum perforatum*'daki hiperisin ışıkta hızla parçalanır (Walker et al., 2001).
- **Oksijen etkisi:** Fenolik bileşikler oksijen varlığında oksidatif bozunmaya uğrar. Özellikle uçucu yağlarda oksidasyon, etkinlik kaybı ve toksik bileşik oluşumuna yol açabilir.

Çözüm:

- Koyu renkli cam şişeler, alüminyum folyo ambalajlar veya vakumlu torbalar kullanılmalıdır.
- Azot (N_2) veya argon (Ar) gibi inert gazlarla paketleme, oksijen maruziyetini azaltır.

7.1.2 Ambalaj Materyali

- **Plastik materyaller:** PVC veya PE ambalajlar uçucu yağ bileşikleri ile etkileşime girerek adsorpsiyon veya göç riskine sahiptir.
- **Metal ve cam:** Kimyasal olarak inerttir ve ışık/oksijen bariyeri sağlar.

7.2 Depolama

7.2.1 Sıcaklık ve Nem

- **Sıcaklık:** 15–25 °C arası sabit sıcaklık önerilmektedir. Yüksek sıcaklıkta depolama, uçucu yağların buharlaşmasına ve fenolik bileşiklerde oksidasyona neden olur.
- **Nem:** Bağıl nemin %40–50 seviyesinde tutulması idealdir. Yüksek nem, mikrobiyal kontaminasyon (küf, maya) riskini artırır.

7.2.2 Süre ve Raf Ömrü

- Raf ömrü, drog tipine göre değişmekle birlikte genellikle **1–2 yıl** ile sınırlandırılmaktadır.
- Uçucu yağ içeren bitkiler (ör. nane, kekik, fesleğen) 12 ayı aşan depolamalarda %15–20 düzeyinde kayıp gösterebilir (Ebadi et al., 2016).

7.2.3 Mikrobiyal ve Kimyasal Güvenlik

- Uygun olmayan depolama koşullarında **aflatoksin** oluşumu en ciddi risklerden biridir. USP <561> ve Ph. Eur., aflatoksin B1 için ≤5 ppb, toplam aflatoksin için ≤20 ppb sınırını belirlemiştir.
- Pestisit ve ağır metal kalıntıları da depolama sırasında migrasyon yoluyla artabilir.

7.3 Örnek Çalışmalar

- *Ocimum basilicum* (fesleğen)'de 12 aylık depolama sonunda linalool içeriğinde %20 azalma gözlenmiştir (Ebadi et al., 2016).
- *Mentha piperita*'da vakumlu ambalajlama ile mentol içeriğinin 6 ay boyunca korunduğu, ancak açık ortamda depolamada %30'a varan kayıp olduğu rapor edilmiştir (Kizil et al., 2010).
- *Curcuma longa* (zerdeçal)'da polifenolik kurkuminoidlerin nemli koşullarda 3 ayda %15 azaldığı bildirilmiştir (Syed et al., 2015).

Ambalajlama ve depolama, drogların **stabilitesi ve güvenliği** için son derece kritik basamaklardır. Yanlış koşullar, sadece biyolojik etkinliği azaltmakla kalmaz, aynı zamanda halk sağlığı için risk oluşturabilecek mikotoksin ve bozulma ürünlerinin oluşmasına da neden olur.

En iyi uygulamalar:

- Işık geçirmez, inert, oksijen bariyerli ambalajlar,
- İnert gaz atmosferinde paketleme,
- Kontrollü sıcaklık ve nemde depolama,
- Lot bazlı izlenebilirlik ve düzenli kalite analizleri.

Tablo 3. Depolama Faktörleri – Risk – Etken Maddeye Etkisi – Önleme Stratejileri

Depolama Faktörü	Risk / Problem	Etken Maddeye Etkisi	Önleme Stratejisi
Sıcaklık	Yüksek sıcaklık uçucu bileşiklerin buharlaşmasına, fenoliklerin oksidasyonuna yol açar	Mentol, timol, linalool gibi uçucularda %15–30 kayıp; C vitamini bozulması	15–25 °C sabit sıcaklık, sıcaklık dalgalanmalarını önleyici depolar
Bağıl Nem	Yüksek nem → küf/maya gelişimi, hidroliz reaksiyonları	Kurkuminoidler, glikozitler ve fenoliklerde bozulma; aflatoksin riski	%40–50 bağıl nem, desikantlar, nem bariyerli ambalaj
Işık (UV/Vis)	Fotooksidasyon ve renk bozulması	Antosiyanin, karotenoid, hiperisin gibi ışığa duyarlı bileşiklerde parçalanma	Koyu cam şişe, ışık geçirmez ambalaj, alüminyum folyo kaplama
Oksijen	Oksidatif bozunma, peroksit oluşumu	Fenoliklerin polimerizasyonu, uçucularda peroksit ve aldehit oluşumu	Vakumlu paketleme, azot/argon atmosferinde ambalajlama
Ambalaj Materyali	PVC/PE ambalajlarda bileşik adsorpsiyonu veya migrasyonu	Uçucu yağlarda kayıp, pestisit/kimyasal bulaşma	Cam, metal veya inert polimer ambalaj kullanımı
Depolama Süresi	Uzun süre → oksidatif bozulma, biyolojik aktivite azalması	12 ay sonra uçucularda %15–20; fenoliklerde %10–15 kayıp	Raf ömrünü 12–24 ay ile sınırlama, parti-parti kalite analizleri
Mikrobiyal Kontaminasyon	Uygunsuz koşullarda küf gelişimi, aflatoksin üretimi	Farmasötik kalite kaybı, toksisite riski	USP <561> limitlerine uygunluk, düzenli mikrobiyolojik analiz, hijyenik depolama alanı

Tablo 4. Ambalajlama ve Depolama Sürecinde Etken Madde Kayıpları ve Önleme Stratejileri

Faktör	Risk / Problem	Etken Maddeye Etkisi	Önleme Stratejisi
Işık (UV, görünür)	Fotooksidasyon, renk bozulması	Antosiyaninler, karotenoidler, hiperisin gibi bileşiklerde parçalanma	Koyu cam, alüminyum folyo, ışık geçirmez ambalaj
Oksijen	Oksidatif bozunma	Fenoliklerde polimerleşme, uçucu yağlarda peroksit oluşumu	Vakumlu paketleme, inert atmosfer (N_2/Ar)
Nem	Küf, maya gelişimi; hidroliz reaksiyonları	Kurkuminoidler, fenolikler ve glikozitlerde parçalanma	%40–50 bağıl nem kontrolü, desikant kullanımı, nem bariyerli ambalaj
Sıcaklık	Uçucu bileşiklerin buharlaşması, fenolik oksidasyonu	Mentol, timol, linalool, askorbik asit kaybı	15–25 °C sabit sıcaklıkta depolama, sıcaklık dalgalanmasını önleme
Ambalaj Materyali	PVC/PE ile uçucu bileşik etkileşimi, migrasyon riski	Uçucu yağlarda adsorpsiyon ve kayıp	Cam, metal veya inert polimer kullanımı
Depolama Süresi	Uzun sürede oksidasyon ve biyolojik aktivite azalması	Linalool (%20), mentol (%30), kurkuminoidler (%15) kaybı	Raf ömrünün 12–24 ay ile sınırlandırılması, periyodik kalite analizleri
Mikrobiyal Kontaminasyon	Uygun olmayan nem ve sıcaklıkta küf gelişimi, aflatoksin riski	Halk sağlığı açısından toksisite, farmasötik kalite kaybı	USP <561> limitlerine uygunluk, mikrobiyolojik testler, temiz depolama alanı

9. Sonuç, Değerlendirme ve Öneriler

9.1 Sonuç

Bu çalışma, tıbbi bitkilerde drog hazırlama sürecinde **etken madde kayıplarının** ortaya çıkış nedenlerini, biyokimyasal mekanizmalarını ve önlenmesine yönelik stratejileri kapsamlı biçimde ele almıştır. Hasat, taşıma, kurutma, öğütme, ekstraksiyon, ambalajlama ve depolama aşamalarında yapılan hataların; fenolik bileşiklerde oksidatif kayıplara, uçucu yağlarda buharlaşmaya, glikozitlerde hidrolize ve mikrobiyal kontaminasyona yol açtığı ortaya konmuştur. Özellikle **ısı, ışık, nem ve oksijen** gibi çevresel faktörlerin kontrol edilmediği durumlarda, drogun farmasötik kalitesinin kısa sürede azaldığı görülmektedir.

9.2 Değerlendirme

- **Hasat ve Taşıma:** Yanlış fenolojik dönemde yapılan hasat, mekanik zedelenme ve gecikmiş taşıma, etken madde kayıplarını artırmaktadır. GACP uygulamaları bu aşamada kritik öneme sahiptir.
- **Kurutma ve Nem Yönetimi:** Yüksek sıcaklık ve uzun süreli kurutma, fenolik ve uçucu bileşiklerde ciddi kayıplara yol açmaktadır. Kontrollü sıcaklık ve nem yönetimi, kaliteyi koruyan en önemli parametredir.
- **Öğütme ve Ekstraksiyon:** Çok ince öğütme oksidasyonu hızlandırmakta; yanlış ekstraksiyon parametreleri termolabil bileşiklerin kaybına neden olmaktadır. Modern teknikler (ultrasonik, mikrodalga, süperkritik CO_2) kaliteyi artırmaktadır.
- **Ambalajlama ve Depolama:** Uygun olmayan ambalaj materyalleri ve kontrolsüz depolama koşulları, uçucu yağ kayıpları, fenolik oksidasyonu ve mikrobiyal riskleri artırmaktadır. Raf ömrü boyunca düzenli kalite kontrol yapılmadığında, ürün güvenliği tehlikeye girmektedir.

Genel olarak değerlendirildiğinde, etken madde kayıpları çoğunlukla **önlenebilir riskler** olup; uygun kalite yönetim sistemleri ve bilimsel yaklaşımlarla minimum düzeye indirilebilmektedir.

9.3 Öneriler

1. **Standardizasyon:** Her bitki türü için **fenolojik dönem, kurutma sıcaklığı, ekstraksiyon parametreleri ve raf ömrü kriterleri** ayrı ayrı belirlenmeli ve ulusal/uluslararası farmakopelerde yer almalıdır.
2. **GACP ve GMP Entegrasyonu:** İyi Tarım ve Toplama Uygulamaları (GACP) ile başlayan süreç, İyi Üretim Uygulamaları (GMP) ile desteklenmeli; tüm zincir boyunca izlenebilirlik sağlanmalıdır.
3. **Modern Teknolojilerin Kullanımı:** Süperkritik CO_2 ekstraksiyonu, ultrasonik/mikrodalga destekli kurutma ve ekstraksiyon gibi yöntemler yaygınlaştırılmalıdır. Üniversite–sanayi iş birlikleri ile küçük ölçekli üreticilerin bu teknolojilere erişimi kolaylaştırılmalıdır.
4. **Ambalajlama ve Depolama:** İnert gaz atmosferinde, ışık geçirmez ve oksijen bariyerli ambalajlar kullanılmalı; depolama alanlarında **15–25 °C sıcaklık** ve **%40–50 bağıl nem** sağlanmalıdır.
5. **Kalite Kontrol:** HPLC, GC-MS, LC-MS/MS gibi ileri analitik yöntemlerle her lotun etken madde profili analiz edilmeli; mikrobiyal ve toksikolojik testler düzenli yapılmalıdır.
6. **Sürdürülebilirlik:** Drog hazırlama süreçlerinde enerji verimliliği yüksek, çevre dostu teknolojiler kullanılmalı; atık yönetimi GACP/GMP kapsamında planlanmalıdır.
7. **Eğitim ve Kapasite Geliştirme:** Üreticiler, toplama ekipleri ve laboratuvar çalışanları düzenli olarak **iyi uygulamalar ve kalite yönetimi** konusunda eğitilmelidir.

Etken madde kayıplarının önlenmesi, yalnızca farmasötik kaliteyi değil; aynı zamanda **halk sağlığını, ekonomik sürdürülebilirliği ve uluslararası rekabet gücünü** doğrudan etkilemektedir. Bu nedenle tıbbi bitkilerde drog hazırlama süreci, **multidisipliner bir yaklaşım** (farmakognozi, gıda bilimi, biyoteknoloji, mühendislik, kalite yönetimi) ile yürütülmelidir.

Tablo 5. Drog Hazırlama Sürecinde Etken Madde Kayıpları ve Önleme Stratejileri

Aşama	Risk Faktörü	Etken Madde Kaybı / Değişimi	Önleme Stratejisi
Hasat	Yanlış fenolojik dönem, gün içi zamanlama, mekanik zedelenme	Uçucu yağlarda kayıp, fenoliklerde oksidasyon	Fenolojik takvim takibi, sabah/öğlen optimum hasat, paslanmaz ekipman kullanımı
Taşıma	Gecikmiş işlem, yüksek sıcaklık/nem, plastik torbalar	Uçucu bileşiklerde buharlaşma, mikrobiyal kontaminasyon	Hızlı taşıma, keten/jüt torba, serin ve kuru koşullar
Kurutma	Yüksek sıcaklık (>60 °C), yavaş kurutma, yüksek aw	Vitamin C kaybı, fenolik oksidasyonu, uçucu yağ uçuşması	35–50 °C kontrollü kurutma, hava sirkülasyonu, aw ≤ 0.6 hedefi
Öğütme & Parçalama	Çok ince partikül, yüksek devirde ısınma, metal teması	Oksidasyon artışı, fenoliklerde kompleksleşme	Orta partikül boyutu (0.5–1 mm), inert/paslanmaz çelik değirmen, soğutmalı öğütücüler
Ekstraksiyon	Uzun süreli yüksek ısı, yanlış çözücü seçimi	Termolabil bileşiklerde kayıp, izomerizasyon	Ultrasonik/mikrodalga destekli ekstraksiyon, uygun çözücü (su-etanol) kullanımı
Ambalajlama	Işık ve oksijen maruziyeti, uygunsuz plastik materyal	Uçucu yağ oksidasyonu, renk değişimi, raf ömrü kısalması	Koyu cam/metal folyo, inert atmosfer (N_2/Ar), vakum paketleme
Depolama	Yüksek sıcaklık, nem dalgalanması, uzun süre	Linalool, timol gibi uçucu yağlarda %20'ye varan kayıp	15–25 °C sabit sıcaklık, %40–50 bağıl nem, düzenli kalite analizi

TIBBİ BİTKİLERDE DROG HAZIRLAMA SÜRECİNDE KALİTE KONTROL PARAMETRELERİ VE STANDARTLAR

MUHAMMET ALİ GÜNDEŞLİ

Kahramanmaraş İstiklal Üniversitesi, Turizm Fakultesi, Gastronomi ve Mutfak Sanatları Bölümü, Kahramanmaraş, Türkiye

ORCID: 0000-0002-7068-8248

ÖZET

Tıbbi bitkilerden elde edilen drogların kalite kontrolü, etkinlik, güvenlik ve standardizasyon açısından kritik öneme sahiptir. Drog hazırlama sürecinde; bitkinin doğru tür ve kısmının kullanımı, hasat zamanı, kurutma koşulları, öğütme derecesi, ambalajlama ve depolama gibi aşamalar kaliteyi doğrudan etkiler. Kalite kontrol parametreleri; **makroskopik ve mikroskopik incelemeler, nem tayini, kül analizleri, etken madde miktar tayini, mikrobiyolojik limit testleri, özgül safsızlıkların belirlenmesi ve organoleptik özelliklerin değerlendirilmesi** gibi yöntemleri içerir. Bu analizler, Avrupa Farmakopesi (Ph. Eur.), Dünya Sağlık Örgütü (WHO) ve ESCOP gibi uluslararası standartlara göre yürütülmelidir. Standardizasyon, her drog partisinde biyoaktif bileşiklerin miktar ve kalitesinin güvence altına alınmasını sağlar. Böylece, tıbbi bitkisel ürünlerin terapötik etkinliği korunur, tüketici güvenliği sağlanır ve ulusal–uluslararası pazarda kabul edilebilirliği artar.

Anahtar Kelimeler: Tıbbi bitkiler · Drog hazırlama · Kalite kontrol · Standardizasyon · Farmakopeler

QUALITY CONTROL PARAMETERS AND STANDARDS IN THE DRUG PREPARATION PROCESS OF MEDICINAL PLANTS

ABSTRACT

The quality control of herbal drugs derived from medicinal plants is of critical importance in terms of efficacy, safety, and standardization. In the drug preparation process, factors such as the correct species and plant part, harvest time, drying conditions, grinding degree, packaging, and storage directly affect quality. Quality control parameters include macroscopic and microscopic examinations, moisture determination, ash analysis, active ingredient quantification, microbiological limit tests, identification of specific impurities, and evaluation of organoleptic properties. These analyses should be conducted according to international standards such as the European Pharmacopoeia (Ph. Eur.), the World Health Organization (WHO), and ESCOP. Standardization ensures the quantity and quality of bioactive compounds in every batch of herbal drugs. Thus, the therapeutic efficacy of herbal medicinal products is preserved, consumer safety is ensured, and their acceptability in national and international markets is enhanced.

Keywords: Medicinal plants • Herbal drug preparation • Quality control • Standardization • Pharmacopoeias

1. GİRİŞ

Tıbbi ve aromatik bitkiler, insanlık tarihinin en eski tedavi araçlarından biri olarak günümüzde de büyük önemini korumaktadır. Dünya Sağlık Örgütü'ne (WHO) göre, dünya nüfusunun yaklaşık %80'i temel sağlık ihtiyaçlarını karşılamak için hâlen bitkisel kökenli tedavilere başvurmaktadır (WHO, 2023). Bu durum, yalnızca geleneksel tıbbın değil, modern farmasötik ve fitoterapötik ürünlerin de bitkisel drog ve ekstreler üzerine inşa edildiğini göstermektedir. Dünya genelinde tıbbi bitkilerin yıllık ticaret hacminin 120 milyar ABD dolarını aştığı, 2050 yılına kadar bu pazarın 5 kat büyümesinin beklendiği bildirilmektedir (Ekor, 2014; Heinrich et al., 2022). Bu artış, tıbbi bitkilerin kalitesine, güvenilirliğine ve standardizasyonuna duyulan ihtiyacı her zamankinden daha önemli hale getirmiştir.

Bitkisel drogların kalitesi, doğrudan etken madde içeriği, saflık, stabilite ve güvenlik parametrelerine bağlıdır. Drog hazırlama sürecinde, hasattan depolamaya kadar olan her aşamada etken madde miktarında değişim, bozulma veya kontaminasyon meydana gelebilir. Bu nedenle kalite kontrol parametrelerinin sistematik bir şekilde uygulanması, ürünün hem farmakolojik etkinliği hem de halk sağlığı açısından güvenliği için zorunludur. Kalite kontrol; bitkinin doğru tür olduğunun teyidinden başlayarak, mikrobiyal ve kimyasal saflık testleri, nem ve kül tayini, organoleptik analizler, etken madde miktar tayini ve raf ömrü değerlendirmelerine kadar uzanan çok yönlü bir süreçtir (WHO, 2023; USP <561>, 2023).

Ulusal ve uluslararası farmakopeler, bu süreci standartlaştırmak için farklı yöntemler geliştirmiştir. Avrupa Farmakopesi (Ph. Eur.), Amerikan Farmakopesi (USP) ve Türk Farmakopesi gibi otoriteler, tıbbi bitkiler için monografiler yayımlamakta; her monografide drogun tanımı, tanımlama kriterleri, saflık testleri ve etkin madde miktar tayini için yöntemler yer almaktadır (Ph. Eur., 2022; Türk Farmakopesi, 2017). Bu monograflar sayesinde farklı coğrafyalarda üretilen ve pazarlanan tıbbi bitkilerde kalite güvence sistemi sağlanabilmektedir. Ancak özellikle gelişmekte olan ülkelerde, sahte veya düşük kaliteli ürünlerin piyasada bulunması hâlâ önemli bir sorundur (Booker et al., 2012).

Kalite kontrol parametrelerinin uygulanmaması, yalnızca etkinliğin azalmasına değil, aynı zamanda ciddi sağlık risklerine de yol açabilir. Örneğin, yüksek nem içeriği nedeniyle aflatoksin kontaminasyonu oluşan tıbbi bitkiler, karaciğer kanseri dahil birçok sağlık problemine zemin hazırlayabilmektedir (Bhat et al., 2010). Benzer şekilde, ağır metal içeren topraklarda yetiştirilen droglar kadmiyum, kurşun ve arsenik kontaminasyonuna maruz kalabilir ve bu maddeler uluslararası limitlerin üzerinde olduğunda halk sağlığı açısından tehdit oluşturur (WHO, 2007). Dolayısıyla kalite kontrol, yalnızca etkinliği artırmak için değil, güvenliği garanti altına almak için de kritik önemdedir.

Son yıllarda tıbbi bitkilerde kalite kontrol, klasik yöntemlerden modern analitik tekniklere doğru önemli bir dönüşüm yaşamaktadır. Nem ve kül tayini gibi basit yöntemler hâlâ önemini korurken; HPLC, GC-MS, LC-MS/MS gibi kromatografik yöntemler, DNA barkodlama ve metabolomik yaklaşımlar kalite standardizasyonunda giderek daha fazla kullanılmaktadır (Parven et al., 2016). Bu gelişmeler, hem sahte ürünlerin tespitini kolaylaştırmakta hem de farmakolojik etkinliği doğrudan belirleyen biyolojik aktif bileşiklerin miktarlarının hassas şekilde ölçülmesine olanak tanımaktadır.

Türkiye açısından bakıldığında, ülkemiz yaklaşık 12.000 bitki taksonuyla dünyanın en zengin floralarından birine sahiptir. Bunun yaklaşık 4.000'i endemiktir ve 500'den fazlası tıbbi ve aromatik bitki olarak kullanılmaktadır (Baytop, 1999; Başer, 2020). Bu zenginlik, Türkiye'yi hem yerel kullanım hem de ihracat açısından stratejik bir konuma getirmektedir. Ancak uluslararası ticarette rekabet gücünün artırılması için, Türk Farmakopesi'nin Avrupa

Farmakopesi ve USP ile uyumlu şekilde güncellenmesi ve kalite kontrol altyapısının güçlendirilmesi gerekmektedir.

Sonuç olarak, tıbbi bitkilerde drog hazırlama sürecinde kalite kontrol parametreleri, hem **etkinlik hem de güvenlik** açısından temel bir zorunluluktur. Farmakopelerde belirtilen standartların yanı sıra modern teknolojilerin entegrasyonu, gelecekte bitkisel drogların daha güvenilir, etkili ve sürdürülebilir bir şekilde kullanılmasına olanak sağlayacaktır.

2. KLASİK KALİTE KONTROL PARAMETRELERİ

Tıbbi bitkilerde drog hazırlama sürecinde kalite kontrolün ilk basamağını klasik farmakopelerce tanımlanan parametreler oluşturur. Bu parametreler, bitkinin fiziksel, kimyasal ve biyolojik özelliklerini değerlendirerek ürünün temel güvenlik ve kalite kriterlerini ortaya koyar. Dünya Sağlık Örgütü (WHO), Avrupa Farmakopesi (Ph. Eur.), Amerikan Farmakopesi (USP) ve Türk Farmakopesi, bu parametreler için belirli standartlar getirmiştir. Aşağıda en yaygın kullanılan klasik kalite kontrol yöntemleri ayrıntılı olarak açıklanmaktadır.

2.1 Nem Tayini

Bitkisel drogların içerdiği **nem oranı**, mikrobiyal gelişim ve kimyasal stabilite üzerinde doğrudan etkiye sahiptir. Yüksek nem, enzimatik reaksiyonları hızlandırarak fenolik bileşiklerde oksidasyona, alkaloidlerde parçalanmaya ve uçucu yağlarda kayıplara yol açar (WHO, 2023). Ayrıca nemli droglar küf ve maya gelişimine uygun ortam oluşturur, bu da aflatoksin gibi mikotoksinlerin oluşmasına neden olabilir (Bhat et al., 2010).

- **Yöntem:** Gravimetrik yöntem en yaygın kullanılan tekniktir. Drog, 105 °C'de sabit ağırlığa ulaşana kadar kurutulur ve kütle kaybı nem miktarı olarak hesaplanır.
- **Farmakope limitleri:** Çoğu bitkisel drogda nem oranı %8–12'nin altında olmalıdır (Ph. Eur., 2022). Örneğin papatya çiçekleri için maksimum %10 nem sınırı belirlenmiştir.
- **Örnek:** *Matricaria chamomilla* (papatya)'da yüksek nemli numunelerde apigenin glikozitleri %20'ye varan oranda parçalanmıştır (Srivastava et al., 2010).

2.2 Kül Tayini

Kül tayini, drog içeriğindeki **inorganik bileşenleri** (mineraller, toprak, kum, metal kalıntıları) belirlemek için yapılan temel testtir.

- **Toplam kül:** Organik bileşenlerin yakılmasıyla geriye kalan inorganik madde miktarıdır.
- **Asitte çözünmeyen kül:** Silika gibi çözünmeyen inorganik kalıntıları gösterir, özellikle toprak ve kum kontaminasyonunu ortaya çıkarır.
- **Suda çözünmeyen kül:** Mineral tuzların çözünürlük özelliklerini değerlendirir.

Farmakope örnekleri:

- *Cassia angustifolia* (sinameki) yapraklarında toplam kül %12'yi, asitte çözünmeyen kül ise %2'yi aşmamalıdır (USP <561>, 2023).
- *Glycyrrhiza glabra* (meyan kökü)'nda kül sınır değeri %8 olarak belirlenmiştir (Ph. Eur., 2022).

Bilimsel bulgu: Yüksek kül miktarı, bitkinin kalitesiz işlendiğini veya sahtecilik amaçlı başka materyallerle karıştırıldığını gösterir (Kumari et al., 2016).

2.3 Organoleptik Özellikler

Organoleptik analiz, drogların **görünüm, renk, koku ve tat** özelliklerinin değerlendirilmesidir. Basit fakat etkili bir yöntemdir.

- **Amaç:** Bitkinin tanımlanması, sahtecilik ve karışıklıkların önlenmesi.
- **Örnek:**
  - Papatya çiçekleri sarı beyaz renkte ve karakteristik elma kokusuna sahiptir.
  - Kekik (Thymus vulgaris) yoğun aromatik ve keskin kokusuyla ayırt edilir.
- **Uygulama:** Farmakopelerde genellikle monografilerde "Tanımlama" kısmında organoleptik özellikler ayrıntılı şekilde tarif edilir.

Organoleptik testler, günümüzde ileri analiz yöntemleri ile desteklenmektedir. Ancak özellikle sahte ürünlerin (örneğin *Digitalis* yaprakları yerine başka yaprakların kullanılması) tespitinde hâlâ ilk basamak olarak önemlidir (Evans, 2009).

2.4 Mikrobiyolojik Limitler

Bitkisel droglar, yetiştirme ve işleme sırasında **mikrobiyal kontaminasyona** maruz kalabilir. Bu durum hem ürünün raf ömrünü azaltır hem de halk sağlığı açısından ciddi riskler doğurur.

- **Önemli patojenler:** *Escherichia coli, Salmonella spp., Staphylococcus aureus, Clostridium perfringens*.
- **WHO ve USP limitleri:**
  - Toplam aerobik bakteri sayısı: $\leq 10^5$ CFU/g
  - Maya ve küf sayısı: $\leq 10^4$ CFU/g
  - *E. coli, Salmonella* gibi patojenler: "Yok" olmalıdır.

Örnek çalışma: Hindistan'da yapılan bir araştırmada pazarda satılan *Withania somnifera* (ashwagandha) köklerinde limitlerin üzerinde mikrobiyal yük saptanmış, bu da üretim ve depolama koşullarının iyileştirilmesi gerektiğini ortaya koymuştur (Mukherjee et al., 2018).

2.5 Yabancı Madde Analizi

Tıbbi drogların içerisine **taş, toprak, böcek parçaları veya başka bitki kısımlarının** karışması, kaliteyi düşüren en yaygın sorunlardan biridir.

- **Farmakope sınırları:** Yabancı madde miktarı genellikle %2–5 arasında sınırlandırılmıştır.
- **Örnek:** *Mentha piperita* (nane) yapraklarında %1'den fazla yabancı maddeye izin verilmez (Ph. Eur., 2022).
- **Analiz yöntemi:** Görsel inceleme, mikroskobik analiz ve taramalı görüntüleme sistemleri kullanılmaktadır.

Bu parametre, hem ticari dürüstlük hem de ürün güvenliği açısından kritik önemdedir.

Klasik kalite kontrol yöntemleri, drogların temel güvenlik ve saflık kriterlerini ortaya koymakta halen vazgeçilmezdir. Nem tayini ile mikrobiyal riskler, kül tayini ile mineral kontaminasyon, organoleptik testlerle tür doğrulaması, mikrobiyoloji ve yabancı madde analizleriyle hijyenik kalite değerlendirilebilmektedir. Bu testler düşük maliyetli, kolay uygulanabilir ve farmakopelerce standartlaştırılmıştır. Ancak modern yöntemlerle

desteklenmediğinde, özellikle etken madde miktar tayini ve sahtecilik tespitinde yetersiz kalabilmektedir. Bu nedenle günümüzde klasik ve modern yöntemler bir arada kullanılmaktadır.

3. MODERN KALİTE KONTROL TEKNİKLERİ

Tıbbi bitkilerde drog kalitesinin güvence altına alınmasında klasik yöntemler temel oluşturmakla birlikte, günümüzde **modern analitik teknikler** kalite standardizasyonunun vazgeçilmez unsurları haline gelmiştir. Kromatografik, spektroskopik ve moleküler biyoloji tabanlı bu yöntemler sayesinde, etken maddelerin **doğrulaması, miktar tayini ve sahtelik tespiti** daha yüksek duyarlılıkla yapılabilmektedir.

3.1 Kromatografik Yöntemler

3.1.1 Yüksek Basınçlı Sıvı Kromatografisi (HPLC)

- **Kullanım alanı:** Flavonoidler, alkaloidler, fenolik asitler, saponinler.
- **Avantajı:** Çok düşük miktarlardaki bileşiklerin hassas tayinine olanak sağlar.
- **Örnek:** *Ginkgo biloba* yapraklarında rutin, kersetin ve ginkgoflavon glikozitlerinin kantitatif tayininde rutin olarak kullanılmaktadır (van Beek, 2005).
- **Türkiye uygulaması:** *Silybum marianum* (devedikeni)'nde silimarin bileşenlerinin standardizasyonu için HPLC-UV analizleri kullanılmaktadır (Küpeli Akkol et al., 2021).

3.1.2 Gaz Kromatografisi-Kütle Spektrometrisi (GC-MS)

- **Kullanım alanı:** Uçucu yağ bileşenleri (terpenler, seskiterpenler, fenilpropenler).
- **Avantajı:** Kompleks uçucu yağ karışımlarını hem ayırır hem de molekül yapısını tanımlar.
- **Örnek:** *Thymus vulgaris* (kekik)'te timol ve karvakrol oranları GC-MS ile belirlenmiş, kemotip farklılıkları ortaya konmuştur (Skoula & Harborne, 2002).
- **Türkiye uygulaması:** GAP bölgesinde yetişen kekik örneklerinde GC-MS analizleriyle yüksek timol kemotipi doğrulanmıştır (Başer, 2020).

3.1.3 LC-MS/MS (Sıvı Kromatografisi – Tandem Kütle Spektrometrisi)

- **Kullanım alanı:** Alkaloidlerin, flavonoidlerin ve fenolik asitlerin iz düzeyde analizi.
- **Avantajı:** Hem ayrıştırma hem de yapısal aydınlatma yapabilir.
- **Örnek:** *Hypericum perforatum* (sarı kantaron)'da hiperisin ve hiperforin miktarlarının LC-MS/MS ile kantitatif tayini yapılmıştır (Southwell and Bourke ., 2001).

3.2 Spektroskopik Yöntemler

3.2.1 UV-Vis Spektroskopisi

- Flavonoidler, fenolik asitler ve karotenoidlerin kantitatif analizinde kullanılmaktadır.
- Basit ve hızlıdır, ancak kompleks karışımlarda selektivitesi düşüktür.

3.2.2 FTIR (Fourier Transform Infrared Spektroskopisi)

- Moleküler fonksiyonel grupların analizinde kullanılır.
- **Örnek:** *Curcuma longa* (zerdeçal)'da kurkuminoidlerin doğrulamasında FTIR kullanılmıştır (Syed et al., 2015).

3.2.3 NMR (Nükleer Manyetik Rezonans)

- Bileşiklerin yapısal aydınlatmasında "altın standart" yöntemdir.
- Ancak yüksek maliyetli olması nedeniyle rutin kalite kontrol yerine araştırma ve doğrulama çalışmalarında kullanılmaktadır.

3.3 DNA Barkodlama ve Moleküler Yöntemler

Tıbbi bitkilerde en büyük sorunlardan biri **yanlış tür kullanımı ve sahtelik**tir. Morfolojik benzerlik gösteren türlerin ayırt edilmesi çoğu zaman zor olabilir. DNA barkodlama, bu sorunu çözmek için geliştirilmiş modern bir tekniktir.

- **Prensip:** Evrensel DNA bölgeleri (ör. rbcL, matK, ITS) sekanslanarak tür tayini yapılır.
- **Örnek:** *Echinacea purpurea* ürünlerinde, farklı Asteraceae türleri ile yapılan sahtecilikler DNA barkodlama ile ortaya çıkarılmıştır (Newmaster et al., 2013).
- **Türkiye uygulaması:** Anadolu'da ticareti yapılan *Origanum* türlerinin DNA barkodlama ile doğrulaması yapılmış ve yanlış etiketleme oranının %15 olduğu rapor edilmiştir (Nazar et al., 2022).

3.4 Metabolomik ve Kemometrik Yaklaşımlar

Son yıllarda **metabolomik profilleme**, bitkisel drogların kalitesini belirlemede güçlü bir araç haline gelmiştir.

- **NMR ve LC-MS tabanlı metabolomik:** Bitkinin tüm metabolit profilini ortaya koyar.
- **Kemometrik analizler (PCA, PLS-DA):** Bölgesel veya ekotip kaynaklı farklılıkların belirlenmesinde kullanılır.
- **Örnek:** *Panax ginseng* örneklerinde metabolomik analizler, farklı kökenlerden gelen numuneler arasındaki kalite farklılıklarını göstermiştir (Park et al., 2014).

Modern kalite kontrol yöntemleri, tıbbi bitkilerde **etken madde standardizasyonu, sahte ürünlerin tespiti ve uluslararası ticaret güvenliği** açısından kritik öneme sahiptir. Klasik yöntemler temel kaliteyi sağlarken, modern yöntemler özellikle **biyolojik aktif bileşiklerin miktar tayini ve doğru tür doğrulaması** için gereklidir. Bu nedenle günümüzde hibrit bir yaklaşım, yani klasik ve modern yöntemlerin birlikte uygulanması en ideal strateji olarak kabul edilmektedir.

4. FARMAKOPELERDE KALİTE STANDARTLARI

Tıbbi bitkilerin küresel ölçekte güvenilir biçimde kullanılabilmesi için, kalite kontrolün **uluslararası standartlarla uyumlu** olarak yapılması gerekir. Bu amaçla Dünya Sağlık Örgütü (WHO), Avrupa Farmakopesi (Ph. Eur.), Amerikan Farmakopesi (USP) ve Türk Farmakopesi gibi otoriteler, bitkisel droglar için **monografl**ar yayımlamaktadır. Bu monograflarda; drogun tanımı, organoleptik özellikleri, saflık testleri, etken madde tayin yöntemleri ve kabul edilebilir limitler yer almaktadır.

4.1 Dünya Sağlık Örgütü (WHO) Standartları

WHO, 1990'lardan itibaren tıbbi bitkilere yönelik kalite kontrol kılavuzları yayımlamaktadır. **"Quality Control Methods for Medicinal Plant Materials"** adlı kılavuz, bitkisel drogların kalite güvencesi için dünya genelinde referans alınmaktadır (WHO, 2023).

- **Tanımlama:** Morfolojik, mikroskobik ve organoleptik özelliklerin tanımı.

- **Saflık testleri:** Nem, kül, yabancı madde, pestisit, ağır metal ve mikrobiyolojik kontaminasyon sınırları.
- **Etken madde tayini:** Gerektiğinde kromatografik yöntemlerle (TLC, HPLC) yapılması önerilir.

Örnek: WHO kılavuzunda *Cassia angustifolia* (sinameki) yaprakları için sennosit A ve B'nin HPLC ile tayini önerilmiştir.

4.2 Avrupa Farmakopesi (Ph. Eur.)

Avrupa Birliği ülkelerinde geçerli olan Avrupa Farmakopesi (Ph. Eur.), bitkisel droglar için en geniş kapsamlı standartları sunmaktadır (Ph. Eur., 2022).

- **Monograflar:** Yaklaşık 200 bitkisel drog için yayımlanmıştır.
- **Testler:** Nem, kül, etanol çözünür ekstrakt, uçucu yağ miktarı, etken madde kantitatif tayini.
- **Kabul limitleri:** Türlere göre değişmektedir.
- **Analitik yöntemler:** HPTLC, HPLC, GC-MS sıklıkla kullanılır.

Örnekler:

- *Matricaria recutita* (papatya) için toplam flavonoid miktarı quercetin eşdeğeri cinsinden ≥0.25% olmalıdır.
- *Thymus vulgaris* (kekik) için uçucu yağ miktarı ≥1.2% (ml/100 g) olarak belirtilmiştir.

4.3 Amerikan Farmakopesi (USP)

ABD'de geçerli olan USP <561> "Articles of Botanical Origin", tıbbi bitkilerin kalite kontrolünde kullanılan kapsamlı bir kılavuzdur (USP, 2023).

- **Sağlık riskleri üzerine odaklanır:** Pestisit kalıntıları, ağır metaller ve aflatoksin limitleri ayrıntılıdır.
- **Aflatoksin sınırları:**
  - Aflatoksin B1 ≤ 5 ppb,
  - Toplam aflatoksin ≤ 20 ppb.
- **Ağır metal limitleri:** Kurşun ≤ 10 ppm, kadmiyum ≤ 0.3 ppm, arsenik ≤ 1 ppm.
- **Mikrobiyolojik limitler:** *E. coli* ve *Salmonella* bulunmamalıdır.

Örnek: *Panax ginseng* monografında ginsenositlerin HPLC ile kantitatif tayini zorunlu kılınmıştır.

4.4 Türk Farmakopesi

Türkiye'de ilk kez 2017'de yayımlanan **Türk Farmakopesi**, bitkisel droglar için de monograflar içermektedir.

- **Kapsam:** 100'den fazla bitkisel drog monografı bulunmaktadır.
- **Testler:** Nem, kül, uçucu yağ miktarı, mikrobiyolojik saflık, yabancı madde.
- **Önem:** Türkiye'nin zengin florası dikkate alındığında, ulusal farmakopenin geliştirilmesi ve Ph. Eur. ile uyumlu hale getirilmesi ihracat açısından stratejiktir.

Örnek: *Foeniculum vulgare* (rezene) meyvelerinde uçucu yağ miktarı %3 (v/w) üzerinde olmalıdır.

Farmakope	Öne Çıkan Özellik	Örnek Parametreler
WHO	Küresel rehber, temel kalite testleri	Nem, kül, yabancı madde, TLC/HPLC
Ph. Eur.	AB standardı, detaylı monograflar	Flavonoid ≥0.25%, uçucu yağ ≥1.2%
USP	Güvenlik odaklı, toksik limitler	Pb ≤ 10 ppm, Aflatoksin B1 ≤ 5 ppb
Türk Farmakopesi	Ulusal standart, uyum süreci	Uçucu yağ miktarı, nem, kül, mikrobiyoloji

Farmakopeler, tıbbi bitkilerin **uluslararası ticarette kabul görmesi** ve **halk sağlığının korunması** açısından vazgeçilmezdir. Ancak standartların ülkeler arasında farklılık göstermesi, özellikle ihracatta sorunlar yaratabilmektedir. Bu nedenle:

- Türk Farmakopesi'nin Avrupa Farmakopesi ve USP ile **uyumlu hale getirilmesi**,
- Laboratuvar altyapısının farmakope gerekliliklerini karşılayacak şekilde güçlendirilmesi,
- Üniversite–sanayi iş birliğiyle yeni monografların geliştirilmesi,

öncelikli adımlar arasında olmalıdır.

5. SONUÇ, DEĞERLENDİRME VE ÖNERİLER

5.1 Sonuç

Bu çalışmada tıbbi bitkilerde drog hazırlama sürecinde kullanılan kalite kontrol parametreleri ve ulusal–uluslararası standartlar kapsamlı biçimde incelenmiştir. Bulgular göstermektedir ki, **drog kalitesi ve güvenliği**, yalnızca etken madde miktarına değil, aynı zamanda nem, kül, organoleptik özellikler, mikrobiyolojik güvenlik ve yabancı madde analizleri gibi çok yönlü parametrelerin izlenmesine bağlıdır. Klasik yöntemler temel kalite ve saflık değerlendirmesinde etkili olmakla birlikte, modern analitik yöntemler (HPLC, GC-MS, LC-MS/MS, DNA barkodlama, metabolomik yaklaşımlar) standardizasyonun sağlanmasında ve sahteciliklerin önlenmesinde kritik rol oynamaktadır.

Farmakopeler (WHO, Ph. Eur., USP, Türk Farmakopesi) tıbbi bitkilerin kalite standartlarını belirleyerek küresel ticarette kabul görebilmesi için ortak bir dil oluşturmaktadır. Ancak ülkeler arasındaki farklı limit değerler, özellikle ihracatta kalite sorunlarını gündeme getirmektedir. Türkiye'nin zengin florası, doğru kalite kontrol ve farmakope uyumuyla küresel pazarda önemli bir rekabet avantajı sağlayabilir.

1. **Klasik yöntemler** (nem tayini, kül tayini, mikrobiyolojik analizler) hızlı, ekonomik ve uygulanabilir olması nedeniyle hâlâ önemini korumaktadır. Ancak bu yöntemler, etkin madde standardizasyonunda tek başına yeterli değildir.

2. **Modern yöntemler** (HPLC, GC-MS, DNA barkodlama) ile etken maddelerin doğru ve güvenilir tayini yapılmakta; böylece ürünlerin hem farmakolojik etkinliği hem de ticari güvenilirliği sağlanmaktadır.

3. **Farmakopeler** kalite kontrolün yasal zeminini oluşturmaktadır. Ancak Türk Farmakopesi'nin Avrupa Farmakopesi (Ph. Eur.) ve USP ile daha fazla uyumlaştırılması, ihracatta engellerin azaltılmasını sağlayacaktır.

4. **Türkiye'de laboratuvar altyapısı**, modern analitik teknikleri uygulayabilecek düzeye getirilmelidir. Aksi halde uluslararası pazarlarda ürünlerin kabulü güçleşmektedir.

5. **Sahtecilik ve yanlış tür kullanımı**, tıbbi bitkilerin en büyük sorunlarından biridir. DNA barkodlama ve metabolomik yaklaşımlar bu sorunların çözümünde etkin bir araç olarak öne çıkmaktadır.

Öneriler

a) Akademi İçin

- Üniversitelerde farmakognozi, fitokimya ve farmasötik botanik alanlarında **nitelikli araştırmalar** desteklenmeli.
- Modern analitik tekniklerin kullanıldığı **multidisipliner projeler** artırılmalı.
- Türk Farmakopesi'nin geliştirilmesi için akademisyenlerin aktif katkısı sağlanmalı.

b) Sanayi İçin

- GMP (İyi Üretim Uygulamaları) ve ISO standartlarına uyum zorunlu hale getirilmeli.
- Drog hazırlamada **parti bazlı izlenebilirlik** (traceability) sağlanmalı.
- Modern laboratuvar altyapısına yatırım yapılmalı, rutin kalite kontrol süreçleri yalnızca klasik yöntemlerle sınırlı kalmamalı.

c) Politika Yapıcılar İçin

- Tıbbi bitkilerin ihracatında **uluslararası farmakopelere uyum** zorunlu hale getirilmeli.
- Bitkisel ürünlerde sahtecilik ve kalite kontrol eksikliği ile mücadele için **daha sıkı regülasyonlar** uygulanmalı.
- Türkiye'nin zengin florasını korumak için **sürdürülebilir üretim ve koruma stratejileri** geliştirilmeli.

Sonuç olarak, tıbbi bitkilerde kalite kontrol, yalnızca akademik bir gereklilik değil; aynı zamanda **halk sağlığını koruyan, ekonomik katma değer yaratan ve uluslararası pazarlarda güven sağlayan stratejik bir zorunluluktur**. Türkiye'nin doğal zenginlikleri, farmakopelere uyumlu kalite kontrol sistemleriyle desteklendiğinde, ülkemiz dünya bitkisel ürün ticaretinde öncü ülkelerden biri haline gelebilir.

ABSTRACT

Postbiotics, which are defined as non-viable microbial cells, cell components or metabolic by-products, are emerging as bioactive compounds with significant applications in food science and health. Postbiotic organic acids are a particularly important class due to their multifunctional properties, including antimicrobial activity, antioxidant potential, modulation of the gut microbiota and support of intestinal health. Lactic acid bacteria (LAB) strains, which are found in various foods such as fermented dairy products, vegetables, cereals and seafood, are the main producers of these metabolites. The main postbiotic organic acids are lactic acid, acetic acid, propionic acid, butyric acid, formic acid, and valeric acid. Each of these acids has a distinct chemical profile and functional role. Lactic acid reduces intestinal pH, thereby inhibiting pathogenic bacteria such as E. coli and Salmonella, while strengthening epithelial barrier function and providing moderate antioxidant activity. Acetic acid modulates the composition of the gut microbiota, promotes the colonisation of probiotics, and exhibits broad-spectrum antimicrobial and antioxidant effects. Propionic acid is a short-chain fatty acid (SCFA) that supplies energy to colonocytes, reduces inflammation, and exhibits potent antimicrobial and antioxidant activity. Butyric acid is a primary energy source for colon epithelial cells. It enhances mucosal barrier integrity, inhibits pathogens including Clostridium difficile, and exhibits strong antioxidant and anti-inflammatory effects. Formic and valeric acids contribute to pH regulation and pathogen inhibition, providing moderate antioxidant protection. A comprehensive overview of the production, chemical characteristics and functional effects of postbiotic organic acids from LAB strains isolated from food and seafood is offered by this study. The interactions of these acids with the host, including the activation and modulation of SCFA receptors and intestinal epithelial cells, highlight their importance in maintaining gut homeostasis and systemic health. Additionally, technological and industrial considerations are discussed, such as the incorporation of these acids into functional foods, their stability during processing and storage, and the associated regulatory challenges. Integrating perspectives from microbiology, food chemistry, and nutritional science, this work emphasises the importance of LAB-derived postbiotic organic acids as multifunctional bioactive compounds that bridge food technology and health promotion. It also explores their potential applications in designing next-generation functional foods and dietary interventions.

Keywords: Postbiotic organic acids; Lactic acid bacteria; Functional foods; Gut health; Antimicrobial activity; Antioxidant properties

1. Introduction

Probiotics and postbiotics have gradually become the focus of scientific and nutritional research [1]. LAB strains from different sources, such as food versus seafood, display distinct metabolite profiles due to environmental adaptation. Seafood-derived LAB are often adapted to saline, protein-rich environments, which may affect their stress tolerance and postbiotic production profiles (Abdul Hakim et al., 2023; Venugopal et al., 2023). Seafood-derived LAB strains exhibit unique metabolic capacities compared to terrestrial sources due to adaptation to marine environments. These postbiotic organic acids interact with host physiology via short-chain fatty acid (SCFA) receptors such as GPR41/43, regulating immune responses, maintaining epithelial barrier integrity, and reducing inflammation (Hu et al., 2025). They also contribute to microbial balance in the gut, creating unfavorable conditions for pathogenic bacteria (Zalán et al., 2010). Functional incorporation of these acids in foods provides both technological benefits and health-promoting effects, though metabolite stability, production conditions, and safety assessments must be considered (Shah et al., 2020; Ajiboye et al., 2021).

This study therefore aims to compare and highlight the organic acid, short-chain fatty acid and vitamin compositions of postbiotics produced by LAB, with a view to selecting the most promising strains for nutritional evaluation and potential industrial application in food systems.

1.2. Postbiotics

Postbiotics, defined as non-viable microbial cells, cell components, or metabolic by-products, are emerging as bioactive compounds with important applications in food science and human health (Aguilar-Toalá et al., 2018; Teame et al., 2020). Postbiotics were described as a mixture of inanimate microbes and/or their elements that provide health benefits to the host directly or indirectly [Aguilar-Toalá et al., 2018; Teame et al.,, 2020]. So, the term 'postbiotic' refers to substances like proteins, B vitamins, peptides, carbs, organic acids, polysaccharides, enzymes, or any other soluble factor (product or metabolic by-product) of microbial metabolisms that are derived after the microorganisms are dead or inanimate [Rad et al., 2020; Rafique et al., 2023]. Furthermore, postbiotics must be derived from well-defined, food-grade microorganisms, which are released following cell lysis during the growth and fermentation of complex microbiological cultures, foods, or the gut environment [Thorakkattu et al., 2022].

Several investigators have proposed multiple terminologies to describe non-viable microbial preparations, including postbiotics and paraprobiotics, using terms such as *non-viable probiotics*, *inactivated probiotics*, *non-biotics*, *ghost probiotics*, and *metabiotics* (Tsilingiri et al., 2012 [24]; Piqué et al., 2019 [28]; Singhal et al., 2018 [29]). Paraprobiotics have been defined similarly to the FAO/WHO definition of probiotics, with minor modifications, as inactivated (non-viable) microbial cells which, when administered in adequate amounts, confer health benefits to the consumer (FAO/WHO, 2001 [30]). To resolve discrepancies in terminology, a recent consensus article by Piqué, Berlanga, and Miñana-Galbis (2019) [31] proposed a clearer classification: (i) postbiotics, defined as non-viable bacterial products or metabolic products from microorganisms that exert biological activity in the host; (ii) paraprobiotics (ghost or inactivated probiotics), defined as non-viable microbial cells—intact or fragmented—or crude cell extracts that provide health benefits when administered orally or topically; and (iii) probioceuticals, referring to specific probiotic-derived bioactive molecules such as reuterin from *Lactobacillus reuteri*. According to more recent interpretations (Zółkiewicz et al., 2020 [32]), paraprobiotics represent dead or inactivated probiotic cells (intact or lysed) or crude cell extracts containing complex cellular components, whereas postbiotics are cell-free supernatants containing metabolic products such as enzymes, secreted proteins, peptides, vitamins, amino acids, short-chain fatty acids, and organic acids (Aguilar-

Toalá et al., 2019 [33]; Wegh et al., 2019 [34]). Adding postbiotics to dairy products can significantly affect their sensory characteristics and is a novel way to enhance their microbial safety due to producing a large number of antioxidant enzymes [Wang et al., 2021]. Nutrients such as vitamins B12 and K, folate, and amino acids, which can be produced by gut bacteria, are examples of postbiotics. Other types include lipopolysaccharides. Enzymes are another type. So are short-chain fatty acids. Bacterial lysates are another type. Cell-free supernants are another type [Ibrahim et al., 2024]. These compounds exhibit anti-inflammatory, antioxidant, and antihypertensive activities, contributing to gut and systemic health (Aguilar-Toalá et al., 2018; Salminen et al., 2021). Due to their chemical stability, postbiotics can be incorporated into functional foods as safe alternatives to live cultures (Rafique et al., 2023).

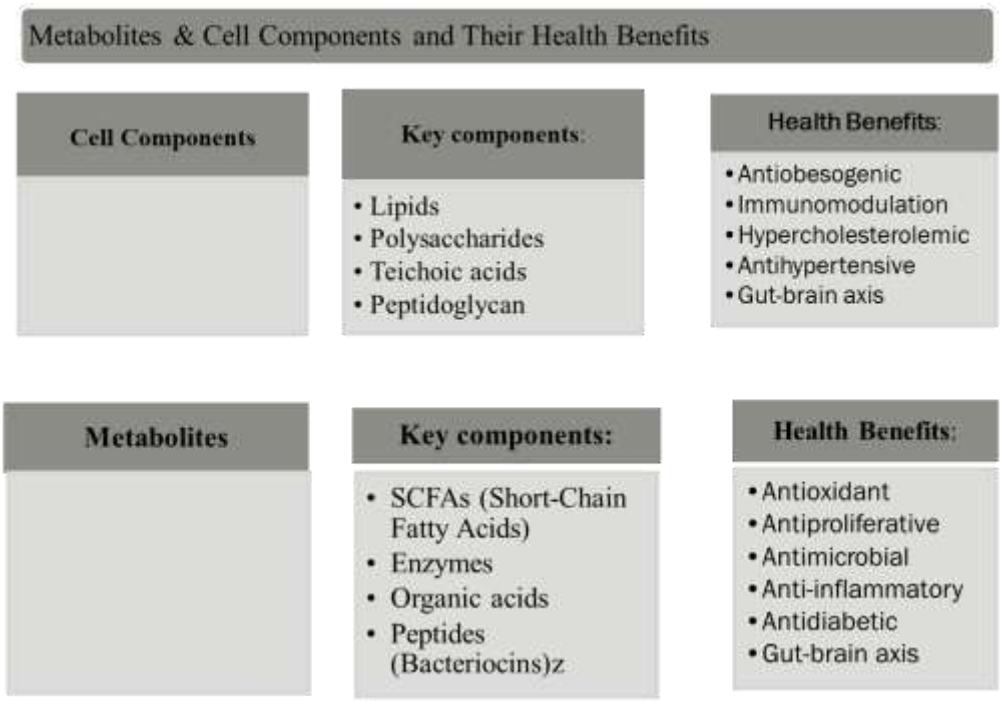

Fig. 1. Benefits of postbiotic such as metabolites and cell component

Postbiotics have several advantages over probiotics, including greater stability, a longer shelf life, increased safety and higher tolerance to environmental stress. Postbiotics have been found to be more resistant to food processing conditions and have been shown to remain active for longer periods, according to Moradi et al. 2019. Noori et al. [2023] emphasised that large quantities of postbiotics are used in the food industry to develop functional foods. Generally speaking, postbiotics exert many of the same beneficial effects as probiotics [Jang et al., 2024]. Research has also demonstrated the effectiveness of postbiotics in preventing paediatric acute gastroenteritis when consumed in fermented cow's milk containing Lacticaseibacillus paracasei (Mishra et al., 2025).

1.2.1 Microbial Metabolites

Microbial metabolites constitute one of the most functionally important categories of postbiotics, produced during the fermentation of dietary substrates by beneficial microorganisms. These metabolites include short-chain fatty acids (SCFAs), tryptophan-derived indoles, bacteriocins, bioactive peptides, amino acids, secreted proteins, and extracellular vesicles, each contributing to host health through distinct biochemical mechanisms (Cummings & Macfarlane, 1991; Shenderov, 2017). SCFAs such as acetate,

propionate, and butyrate are particularly significant due to their roles in regulating immune responses, enhancing epithelial barrier integrity, modulating oxidative stress, and supporting metabolic homeostasis (Canani et al., 2011; Belenguer et al., 2006; Scheppach, 1994). These acids also exert antimicrobial effects by lowering luminal pH and disrupting pathogenic cell membranes (Gonzalez, Lee, Schluter, Ravel & Patterson, 2014). Additional microbial metabolites—including tryptophan catabolites—further influence gut–immune and gut–brain signaling pathways, enhancing mucosal tolerance and reducing inflammation (Thorburn, Macia & Mackay, 2014; Kudryasheva, 2004). Collectively, these postbiotic-derived metabolites form the biochemical foundation of the therapeutic and nutritional benefits attributed to postbiotic interventions, demonstrating improved stability, safety, and functional consistency compared to live probiotic formulations (Cremon et al., 2017; Nataraj, Ali, Behare & Yadav, 2020).

Chain Fatty Acids (SCFAs)

Short-chain fatty acids (SCFAs)—primarily acetate, propionate, and butyrate—are the most abundant microbial fermentation products and represent the core functional group of postbiotic metabolites. Produced through microbial fermentation of dietary fibers that escape digestion, SCFAs exert wide-ranging physiological effects, including energy supply for colonocytes, reinforcement of epithelial barrier integrity, and maintenance of mucosal homeostasis (Cummings & Macfarlane, 1991). SCFAs regulate host immunity and inflammation through G-protein-coupled receptors—particularly GPR41, GPR43, and GPR109A—modulating cytokine production and promoting anti-inflammatory responses such as IL-10 secretion (Thorburn, Macia & Mackay, 2014).

Clinically, butyrate demonstrates strong therapeutic potential; rectal butyrate administration has been shown to improve mucosal healing and reduce symptoms in ulcerative colitis through mechanisms involving histone deacetylase (HDAC) inhibition and suppression of NF-κB signaling (Canani, Costanzo, Leone, Pedata, Meli & Calignano, 2011). SCFAs also contribute to metabolic homeostasis by regulating glucose and lipid pathways, reducing lipogenesis, and enhancing mitochondrial function, collectively lowering the risk of metabolic syndrome (Belenguer, Duncan, Calder, Holtrop, Louis, Lobley & Flint, 2006).

Additionally, organic acids act synergistically with other postbiotic metabolites; for example, SCFAs markedly inhibit enteric pathogens such as *Escherichia coli* and *Clostridium difficile* through pH reduction, membrane disruption, and intracellular acidification (Gonzalez, Lee, Schluter, Ravel & Patterson, 2014). Further microbial products—including tryptophan-derived indoles—contribute to gut–immune and gut–brain signaling networks, supporting immune tolerance and epithelial protection (Shenderov, 2017; Kudryasheva, 2004). Collectively, these mechanisms underline the central role of SCFAs as key mediators of postbiotic biological activity and host metabolic and immune regulation.

Microbial Enzymes

Microbial enzymes are also considered postbiotic components due to their bioactivity and health-promoting effects. These include digestive enzymes that facilitate the breakdown of complex carbohydrates, proteins, and lipids, thereby enhancing nutrient absorption and supporting gastrointestinal function.

Additionally, certain enzymes and enzyme-derived peptides—such as bacteriocins—exhibit potent antimicrobial activity. Bacteriocins inhibit the growth of pathogenic microorganisms, contribute to colonization resistance, and help maintain microbial balance within the gut

ecosystem [7]. Through these mechanisms, microbial enzymes play a significant role in protecting the host against infections and improving overall gut health.

1.2.2. Microbial Cell Components

Microbial cell components such as peptidoglycans, lipoteichoic acids, lipopolysaccharides, exopolysaccharides (EPS), surface proteins, and cell wall fragments represent a major functional category of postbiotics due to their direct interactions with host epithelial and immune cells. These structural molecules can activate pattern-recognition receptors—including TLR2, TLR4, and NOD2—leading to controlled immune modulation, enhanced mucosal protection, and reduced inflammatory signaling (Aguilar-Toalá et al., 2018; Salminen et al., 2021). Exopolysaccharides produced by LAB contribute to intestinal barrier strengthening by promoting tight-junction protein expression and improving epithelial resistance to oxidative and inflammatory stress (Ibrahim et al., 2024). Peptidoglycan fragments and surface-layer proteins also influence dendritic-cell maturation and cytokine production, supporting both innate and adaptive immune functions (Thorakkattu et al., 2022). Collectively, these microbial cell-derived compounds constitute a core component of postbiotic functionality, contributing to gut homeostasis, epithelial integrity, and host immune regulation.

1.3. Postbiotic Metabolites: Organic acids

Organic acids are among the most biologically active postbiotic metabolites, forming a key link between microbial fermentation, gut physiology and host health. Postbiotics include a variety of microbial cellular components, such as peptidoglycans, lipoteichoic acids and exopolysaccharides (EPS), but their core function is primarily driven by organic acids produced during the microbial breakdown of dietary substrates. These acids modulate gut pH, inhibit pathogens, and shape immune tolerance, epithelial integrity, and metabolic signalling (Aguilar-Toalá et al., 2018; Salminen et al., 2021).

Dietary carbohydrates that escape human enzymatic digestion, particularly indigestible fibres, are essential for synthesising postbiotic organic acids. These fermentable substrates are selectively metabolised by gut microorganisms into short-chain fatty acids (SCFAs), primarily acetate, propionate and butyrate (Cummings & Macfarlane, 1991). Their formation depends on specific microbial pathways: Lactobacilli convert carbohydrates to pyruvate via glycolysis, and then to lactate and acetate. Heterofermentative lactic acid bacteria (LAB) utilise the phosphoketolase pathway (Table 1), while bifidobacteria generate acetate, lactate, and formate depending on substrate availability (Rivière, Selak, Lantin, Leroy & De Vuyst, 2016).

Table 1. Organic acid chemical Formula, basic chemical structure, Mechanism of Action

Organic Acid	Chemical Formula (Kapalı Formül)	Basic Chemical Structure (Özet)	Mechanism of Action
Lactic acid	$C_3H_6O_3$	α-hydroxy acid; CH_3–CH(OH)–COOH	Lowers pH, disrupts pathogen membranes via proton influx; precursor for butyrate production; modulates immune pathways via GPR81
Acetic acid	$C_2H_4O_2$	Simple monocarboxylic acid; CH_3–COOH	Rapid systemic absorption; activates GPR43/41; reduces intracellular pH of pathogens
Propionic acid	$C_3H_6O_2$	CH_3–CH_2–COOH	Inhibits hepatic HMG-CoA reductase; modulates gluconeogenesis; acidifies gut lumen
Butyric acid	$C_4H_8O_2$	CH_3–CH_2–CH_2–COOH	Primary colonocyte energy source (via MCT1 transport); potent HDAC inhibitor; improves barrier integrity
Formic acid	CH_2O_2	H–COOH	Strong acidifier; disrupts microbial electron transport; inhibits bacterial metabolism
Valeric acid	$C_5H_{10}O_2$	CH_3–$(CH_2)_3$–COOH	GPCR activation (GPR41 affinity); modulates neuronal and immune signaling
Caproic acid (Hexanoic acid)	$C_6H_{12}O_2$	CH_3–$(CH_2)_4$–COOH	Disrupts pathogen lipid bilayers by chain penetration
Pyruvic acid	$C_3H_4O_3$	CH_3–CO–COOH	Central intermediate linking glycolysis to SCFA production; antioxidant electron sink
Succinic acid	$C_4H_6O_4$	HOOC–CH_2–CH_2–COOH	Activates SUCNR1 receptor; modulates macrophage metabolism
Malic acid	$C_4H_6O_5$	HOOC–CH_2–CHOH–COOH	TCA cycle intermediate; contributes to redox balance
Citric acid	$C_6H_8O_7$	HOOC–CH_2–C(OH)(COOH)–CH_2–COOH	Chelates metal ions; lowers pH; enhances microbial inhibition
Phenyllactic acid	$C_9H_{10}O_3$	Aromatic α-hydroxy acid	Disrupts pathogen cell membranes; interferes with quorum sensing
Indole-3-lactic acid	$C_{11}H_{11}NO_3$	Indole-derived hydroxy acid	Aryl hydrocarbon receptor (AhR) agonist

During these processes, species such as *Lactobacillus* and *Bifidobacterium* metabolise prebiotic substrates and release extracellular acids, while intracellular fractions can be obtained by deliberately disrupting the cells. Methods of extraction and purification—including enzymatic or thermal treatment, membrane filtration, centrifugation, sonication, high-pressure processing, dialysis, solvent extraction and lyophilisation—enable the precise recovery of these metabolites for therapeutic and technological applications (Nataraj et al., 2020).

The generation of postbiotic organic acids depends on controlled microbial fermentation. Seafood-associated LAB species, such as Lactobacillus plantarum and L. sakei, are emerging as promising sources of postbiotic organic acids due to their ability to adapt to saline, protein-rich marine environments. These strains demonstrate high stress tolerance and distinctive metabolic capabilities, producing stable and diverse organic acid profiles with potential applications in food biotechnology and the development of functional ingredients (Venugopal et al., 2023; Abdul Hakim et al., 2023). Together, the synthesis, extraction and biological activity of organic acids are at the heart of postbiotic functionality. Their capacity to integrate microbial metabolism with host immune, epithelial and metabolic responses highlights their significance as fundamental mediators of gut health.

Lactic acid represents the principal organic acid produced by LAB and plays a central role in antimicrobial defense by lowering environmental pH and enhancing host immune responses (Begunova, 2022). Lactic acid and lactate also serve as metabolic intermediates for the production of **butyrate**, a key short-chain fatty acid essential for colonocyte energy metabolism and the maintenance of intestinal epithelial integrity (Belenguer et al., 2006; Scheppach, 1994).

Acetic acid, another dominant metabolite, is rapidly absorbed into systemic circulation and participates in metabolic and immune signaling; experimental models demonstrate that elevated acetate levels can enhance resistance to infection (Thorburn et al., 2014). **Propionic acid** exhibits anti-inflammatory activity and has been shown to inhibit hepatic cholesterol synthesis through its effects on metabolic pathways (Bush & Milligan, 1971). In addition to these major SCFAs, LAB produce **formic and valeric acids**, which contribute to maintaining gut ecological stability by acidifying the intestinal environment, thereby reducing pathogen viability (Zalán et al., 2010).

Propionic acid is comprised of three carbonic acids and occurs naturally in milk and other dairy products. It is produced in the process of natural fermentation by *Propionibacterium*. It is also added as a food preservative. It has antibacterial and antifungal properties.The biological activity of these organic acids begins immediately upon entering the gastrointestinal tract, as postbiotics reach the colon largely unchanged, circumventing the colonization requirements associated with live probiotic cells (Ardatskaya et al., 2020). Their combined antimicrobial, antioxidant, immunomodulatory, and metabolic roles support gut homeostasis and systemic health (Shenderov, 2017; Kudryasheva, 2004).

Mechanisms of Action of SCFA-Driven Organic Acids

Postbiotic metabolites, those produced by lactic acid bacteria (LAB) are the most widely studied and functionally important. Lactic, acetic, propionic, butyric, formic and valeric acids contribute to microbial competitiveness, food preservation and host physiological regulation by modulating pH, exhibiting antimicrobial activity and producing redox effects and SCFA-mediated metabolic signalling (Prajapati et al., 2023; Ranjha et al., 2021; Amobonye et al., 2025).

Each SCFA follows a distinct metabolic fate and engages specific host receptors. Acetate diffuses systemically and activates GPR41 and GPR43, modulating metabolic and immune pathways (Thorburn, Macia & Mackay, 2014). Propionate serves as a substrate for hepatic gluconeogenesis and suppresses cholesterol synthesis via inhibition of HMG-CoA reductase (Bush & Milligan, 1971). Butyrate, transported into colonocytes through the monocarboxylate transporter MCT1, is their primary energy source and acts as a potent histone deacetylase inhibitor (HDACi), mediating epigenetic regulation of gene expression, strengthening epithelial tight junctions, suppressing NF-κB signaling, and inducing apoptosis in dysplastic cells (Prajapati, et al. 2023).

These chemical mechanisms form the basis of the well-documented health effects of SCFAs. By supporting colonocyte metabolism and enhancing tight junction integrity, organic acids reinforce the intestinal barrier and increase transepithelial electrical resistance (TEER), preventing microbial translocation (Cremon et al., 2017; multiple TEER studies 2010–2018). SCFA–receptor interactions promote IL-10 production, enhance mucosal tolerance, and reduce pro-inflammatory cytokines, contributing to clinical improvement in conditions such as IBD, IBS, and metabolic syndrome (Shenderov, 2017; Kudryasheva, 2004). Additionally, synergistic mixtures of acetate, propionate, and butyrate inhibit enteric pathogens including *Clostridium difficile* and *Escherichia coli*, through mechanisms involving pH stress, membrane disruption,

and intracellular acidification (Gonzalez, et al., 2014). Collectively, these biochemical pathways confirm that LAB-derived organic acids function not only as key postbiotic metabolites but also as central regulators of gut homeostasis, immune modulation, and host metabolic health (Belenguer et al., 2006).

Marine-Isolated Probiotics and Their Organic Acid Profiles

Marine-isolated probiotics are beneficial microorganisms derived from seawater or marine organisms such as fish, shellfish, and shrimp. Adaptation to the marine ecosystem provides these strains with advantages including salt tolerance, temperature resilience, and strong competitive fitness in saline environments. In aquaculture, they offer significant potential for enhancing animal health, improving immune responses, and increasing feed efficiency (Fernández-Alarcón et al., 2021; Martínez-Cámara et al., 2023). Beyond aquaculture, marine-origin probiotics can also be incorporated into the food industry as functional food components, expanding the diversity of beneficial microbes beyond traditional dairy-associated strains.

Seafood-derived probiotics and their metabolic products—particularly postbiotic organic acids such as lactic, acetic, propionic, butyric, formic, valeric, succinic, and citric acids—play central roles in microbial ecology and host physiology. These acids reduce environmental pH, disrupt pathogenic membranes, regulate oxidative stress, and support gut homeostasis through SCFA-mediated signaling pathways (Cummings & Macfarlane, 1991; Gonzalez et al., 2014). Once produced, LAB-derived organic acids reach the colon largely intact, bypassing the need for microbial colonization and providing immediate biological activity (Shenderov, 2017; Kudryasheva, 2004). Their systemic effects involve GPCR-mediated immunometabolic signaling, while butyrate further exerts epigenetic effects via histone deacetylase inhibition, contributing to epithelial barrier strengthening, anti-inflammatory activity, and regulation of cellular homeostasis (Thorburn, Macia & Mackay, 2014)

Marine-associated LAB—including *Lactobacillus plantarum* and *L. sakei*—have evolved unique metabolic traits driven by exposure to saline and protein-rich environments. As a result, they generate diverse and stable profiles of organic acids, offering high functional potential for food technology and next-generation nutraceuticals (Venugopal et al., 2023; Abdul Hakim et al., 2023). Additional marine isolates, such as bacteriocin-producing LAB from gilthead seabream, antioxidant- and enzyme-producing *Bacillus* strains, and marine yeasts like *Yarrowia lipolytica*, display strong antimicrobial, immunomodulatory, and biopreservative properties relevant to both aquaculture and human food systems (Fernández-Alarcón et al., 2021).

The functional benefits associated with marine-derived probiotics include enhanced host immunity, inhibition of pathogenic microorganisms, improved growth performance in aquaculture species, and suitability for incorporation into functional-food formulations. However, their broader application requires rigorous safety assessment—including evaluation of virulence and antibiotic-resistance genes—as well as establishment of regulatory guidelines and scalable industrial production systems (Mayer & Santos, 2011; Kumar et al., 2025). Postbiotics derived from these strains, including SCFAs, cell wall fragments, enzymes, exopolysaccharides, and cell-free supernatants, offer chemically stable and well-defined structures with demonstrated bioactivity, presenting a controlled and safer alternative to live probiotics in therapeutic and industrial contexts (Cummings & Macfarlane, 1991; Cremon et al., 2017).

Their incorporation into functional foods guarantees consistent bioactivity, reliable fermentation results, prolonged shelf life, and the maintenance of biochemical functionality in

products aimed at enhancing cognitive or metabolic function (Scott, et al., 2022). Collectively, seafood-derived probiotics and their postbiotic organic acids function as multifunctional bioactive agents that integrate microbial metabolism, food biotechnology, and host health, demonstrating strong potential for application in next-generation functional foods and targeted nutritional interventions (Belenguer et al., 2006; Thorburn, Macia & Mackay, 2014).

Health Effects of Postbiotic Organic Acids

Their structural stability and resistance to gastrointestinal degradation further enhance their The human gut microbiota is now recognized as a central regulator of systemic and mental health through the microbiota–gut–brain axis (MGBA), a bidirectional communication network linking intestinal microorganisms with neural, immune, and endocrine pathways (Marano et al., 2023). Advances in microbial therapeutics have highlighted probiotics, prebiotics, postbiotics, and synbiotics as next-generation functional biotics with neuroactive potential (Schneider et al., 2024). Probiotic microorganisms—particularly *Lactobacillus* and *Bifidobacterium* species—not only support intestinal homeostasis but also synthesize key biogenic amines such as serotonin, dopamine, γ-aminobutyric acid (GABA), and tryptamine, which function as microbial neurotransmitters influencing stress responses, cognition, and emotional regulation (Ranjha et al., 2021; Ramesh et al., 2024; Bleibel et al., 2023). These neuroactive metabolites form the biochemical foundation of psychobiotic action, demonstrating how gut microorganisms modulate central nervous system function and contribute to improved mental well-being (Cryan et al., 2021).Postbiotic derivatives—consisting of inactivated microbial biomass and secreted metabolites—serve as reproducible metabolic platforms with enhanced safety and stability (Islam et al., 2024; Zhu et al., 2025). Thermal, enzymatic, or mechanical inactivation preserves key metabolites such as peptides, short-chain fatty acids, and amino acid derivatives, which maintain bioactivity, modulate fermentation kinetics, and influence co-cultured strains (Amobonye et al., 2025).

Once synthesised, organic acids exert an immediate biochemical effect within the intestinal lumen. By lowering the pH level, they disrupt the membrane integrity of pathogenic bacteria through proton influx and the collapse of the proton motive force — an established antimicrobial mechanism (Gonzalez, Lee, Schluter, Ravel & Patterson, 2014). In addition to these effects in the intestinal lumen, SCFAs act as signalling molecules that regulate epithelial energy metabolism, mucosal repair, tight-junction assembly, oxidative balance and immune pathways. This contributes significantly to maintaining gut homeostasis (Canani et al., 2011; Scheppach, 1994).

This shift represents a paradigm change in microbial biotechnology: survival-based probiotic models are increasingly complemented or replaced by metabolite-driven psychobiotic systems. Microbial metabolites now form the fundamental building blocks for functional innovation, bridging food science, metabolic engineering, and microbial ecology to create reproducible, scalable, and neuroactive bioproducts suitable for advanced nutritional and biotechnological applications (Kyei-Baffour et al., 2025; Rocchetti et al., 2025).

Table 2. Microbial Organic Acids: Functions and Health Effects

Acid	Category / Source	Function / Purpose	Effects on Gut Health	Antimicrobial Effect	Antioxidant Effect
Lactic Acid	Lactic acid bacteria (LAB)	pH regulator; probiotic-derived metabolite	Lowers gut pH; inhibits pathogen growth; strengthens epithelial barrier	Inhibits Gram-negative and Gram-positive pathogens (e.g., *E. coli*, *Salmonella*)	Moderate antioxidant activity
Acetic Acid	LAB; fermentation end product	Antimicrobial; metabolic regulator	Modulates gut microbiota; supports probiotic colonization	Broad-spectrum antimicrobial activity (*Salmonella*, *Listeria*)	Mild antioxidant; reduces lipid peroxidation
Propionic Acid	*Propionibacterium* species	SCFA; energy and metabolic regulator	Provides energy to colon cells; reduces inflammation	Inhibits several intestinal pathogens	Strong antioxidant activity
Butyric Acid	*Clostridia* and some LAB	SCFA; anti-inflammatory; energy source	Primary fuel for colonocytes; strengthens mucosal barrier; decreases inflammation	Inhibits pathogens, especially *Clostridium difficile*	Strong antioxidant; protects epithelial cells
Formic Acid	LAB and some *Bacillus* strains	Acidifier; preservative	Stabilizes gut microbiota; suppresses pathogen growth	Effective antimicrobial, especially against enteric pathogens	Mild antioxidant effect
Valeric Acid	SCFA; various fermentative bacteria	Anti-inflammatory; metabolic support	Enhances gut barrier; reduces inflammatory responses	Helps inhibit pathogen colonization	Moderate antioxidant activity

Conclusion

In summary, LAB-derived and marine-derived postbiotic organic acids are multifunctional microbial metabolites that integrate antimicrobial defense, immune regulation, epithelial barrier enhancement, and metabolic signaling into a single bioactive framework. Their chemical stability, defined molecular structures, and independence from microbial viability make them advantageous alternatives to conventional probiotics, particularly in functional foods, aquaculture, and therapeutic nutrition. The diverse biochemical mechanisms of acetate, propionate, butyrate, and related organic acids highlight their central role in maintaining gut homeostasis and systemic health. Collectively, these compounds exemplify the next generation of postbiotic interventions, offering reliable, safe, and efficacious strategies for targeted nutritional and biomedical applications.

ABSTRACT

Probiotic strains derived from seafood, particularly lactic acid bacteria (LAB), are widely used in aquaculture and functional foods due to their health-promoting properties, which include inhibiting pathogens, modulating gut microbiota and enhancing host immunity. These microorganisms improve the functional quality of seafood-based products and support the health of aquatic animals and human consumers. However, some probiotic strains may harbour antibiotic resistance (AR) genes, which could be transferred to other microorganisms through horizontal gene transfer, representing a potential biosafety concern. Antibiotic resistance in probiotics can be intrinsic or acquired through mobile genetic elements such as plasmids, transposons, and integrons. Mechanisms include the enzymatic inactivation of antibiotics, efflux pump activity and the modification of antibiotic targets. The variation in AR traits among LAB species and strains highlights the importance of carefully selecting and characterising probiotic candidates. To ensure the safe use of seafood-derived probiotics, systematic strain screening, genomic characterisation and adherence to regulatory guidelines are required. Selecting strains without transferable AR genes, coupled with monitoring and evaluation, is essential to minimise risks in aquaculture and food systems. Furthermore, interventions such as organic acid supplementation can support microbial safety and reduce potential virulence. This study provides an overview of the mechanisms and safety considerations associated with antibiotic resistance in seafood-derived probiotics, emphasising the importance of balancing functional benefits with public health and environmental safety considerations. The responsible selection and monitoring of probiotic strains is critical to their effective and safe application in aquaculture and functional food production.

Keywords: seafood probiotics, lactic acid bacteria, antibiotic resistance, food safety

Introduction

Antimicrobial resistance (AMR) has become one of the most critical global problems threatening human health, environmental sustainability, and food production systems. Population growth, urbanization, the rise of intensive production systems, and the uncontrolled use of antibiotics are accelerating the selection of resistant bacteria and leading to the increasing prevalence of multidrug-resistant (MDR) pathogens in the community, hospitals, and the food chain (1). This complicates the treatment of serious infections and poses high risks of mortality and economic losses to public health.

In recent years, the global aquaculture sector has become a major focus for AMR (2). World aquaculture production reached 185 million tons in 2022; this increase was largely fueled by intensive aquaculture systems relying on antibiotic applications (3). The uncontrolled use of antibiotics at subtherapeutic doses has created a strong selection pressure in aquatic environments, leading to the rapid spread of resistance genes (ARGs) through mobile genetic elements among microbial communities (4). This spread is not limited to aquatic microorganisms; an integrated resistance pool is forming among human, animal, and environmental reservoirs (5).

The factors that cause AMR are not limited to aquaculture. Urban wastewater, agricultural drainage, hospital effluents, livestock waste, and food processing plants are also important sources of ARG accumulation (6,7). The detection of high densities of Enterobacteriaceae in river and coastal ecosystems suggests that these water sources directly impact fish farms, increasing ARG levels (8). The transfer of resistant bacteria into the food chain poses a critical risk to consumer health. Food pathogens such as Salmonella, Escherichia coli, Campylobacter, Listeria monocytogenes, and Staphylococcus aureus have been reported to have developed resistance to many classes of antibiotics and are particularly prevalent in poultry, red meat, and seafood (9). Multicenter international studies have reported alarming levels of resistance to critical classes of antibiotics—third-generation cephalosporins, carbapenems, fluoroquinolones, and polymyxins (10). Therefore, the One Health Joint Action Plan published by WHO, FAO, WOAH, and UNEP emphasizes that the environmental, animal, and human components of AMR cannot be separated and that a multisectoral, holistic approach is essential (11).

The widespread use of metagenomic technologies has more clearly revealed the presence of pathogens with multiple resistance genes, particularly in aquaculture products (12). According to the MicroBIGG-E database, clinically critical ARGs such as β-lactamases (ESBL), carbapenemases (bla_NDM), colistin resistance (mcr), tigecycline resistance (tetX), and glycopeptide resistance (vanA) are prevalent worldwide in microorganisms isolated from fish and shellfish (8). These findings clearly demonstrate that AMR is no longer merely a clinical problem but a multidimensional crisis in terms of agricultural production, environmental sustainability, and global food security.

In this context, probiotics derived from seafood—especially lactic acid bacteria (LAB)—are widely used in aquaculture and functional foods (13). These microorganisms have beneficial effects such as pathogen inhibition, regulation of the intestinal microbiota, immune support, and improved product quality. Many LAB strains are considered GRAS (Generally Recognized as Safe) or QPS (Qualified Presumption of Safety) and are therefore considered safe (14). However, in recent years, it has been shown that some LAB strains carry intrinsic or acquired antibiotic resistance genes and that these genes can be transferred to other microorganisms via mobile genetic elements (EFSA, WHO). This poses a potential biosafety risk in the use of probiotics.

This review evaluates the mechanisms and prevalence of antibiotic resistance in seafood-derived probiotic strains, and the potential risks they pose to food safety, emphasizing the importance of safe strain selection, genomic characterization, and regulatory approaches. The aim is to offer an approach that minimizes the risk of spreading resistance genes while preserving the functional benefits of probiotics.

2. Antibiotic Resistance Mechanisms

Antibiotic resistance traits observed in probiotic bacteria isolated from seafood can be both intrinsic (natural) and acquired (via mobile genetic elements). Accurately identifying resistance mechanisms is critical for strain safety assessments. Three main mechanisms of antibiotic resistance are generally recognized: (i) enzymatic inactivation of antibiotics, (ii) modification or preservation of the target site, and (iii) cellular excretion of the antibiotic (efflux pumps) (15).

2.1. Enzymatic Inactivation

One of the best-defined mechanisms of antibiotic resistance in bacteria is enzymatic inactivation of the antibiotic. In this mechanism, enzymes encoded by resistance genes directly disrupt the structure of the antibiotic molecule or inactivate the drug by chemical modification. β-lactamases, aminoglycoside-modifying enzymes, and chloramphenicol acetyltransferases are particularly important in this group (16). β-lactamases hydrolyze the ring structure of β-lactam antibiotics, inactivating penicillin, cephalosporin, and monobactam classes of drugs; broad-spectrum variants, extended-spectrum β-lactamases (ESBL), have gained particular clinical importance by conferring high resistance to third-generation cephalosporins (17). Similarly, aminoglycoside phosphotransferases, adenyltransferases, and acetyltransferases chemically modify the hydroxyl or amino groups of aminoglycoside antibiotics, reducing their binding affinity and rendering ribosomal target sites inaccessible (18). Chloramphenicol acetyltransferases, on the other hand, acetylate the chloramphenicol molecule, preventing its binding to the ribosomal 50S subunit and inactivating the antibiotic. This enzyme is susceptible to horizontal gene transfer because it can be carried by both chromosomal genes and plasmids (19). These enzymatic resistance mechanisms have been reported not only in clinical pathogens but also in environmental and foodborne bacteria. Increasing evidence indicates the presence of ESBL genes, aminoglycoside-modifying enzymes, and chloramphenicol acetyltransferases, particularly in members of the Enterobacteriaceae and lactic acid bacteria isolated from marine environments (8). High antibiotic use in aquaculture environments creates strong selection pressure in the water column and sediment, accelerating the spread of genes encoding these enzymes via mobile genetic elements (5). Therefore, enzymatic inactivation not only reduces pharmacological efficacy but also poses a significant risk for resistance transmission in the food chain and probiotic applications.

2.2. Target Change and Protection

Many antibiotics act by binding to a specific molecular target in the cell, and the structural integrity of this target site is critical to the antibiotic's effectiveness. Resistance genes prevent antibiotic binding by altering or preserving the structure of this target site. One of the most common examples is point mutations in ribosomal proteins or ribosomal RNA regions. These mutations alter the binding sites of drugs that target protein synthesis, particularly macrolides, lincosamides, and streptogramins. In macrolide resistance, methylases encoded by erm genes sterically obstruct the antibiotic's binding pocket by methylating the 23S rRNA, which can lead to high-level resistance (20). Similarly, mutations or overexpression in penicillin-binding proteins (PBPs) targeting β-lactam antibiotics prevent the drug from binding to the

transpeptidase domain, and cell wall synthesis continues. This mechanism is well-defined in Staphylococcus and Enterococcus species, and even probiotic LAB strains have reported low-level β-lactam susceptibility due to intrinsic PBP differences (21).

Resistance to antibiotics targeting DNA replication, such as fluoroquinolones, most often arises from mutations in the DNA gyrase (gyrA) or topoisomerase IV (parC) genes. These mutations prevent the formation of the enzyme-antibiotic complex, allowing DNA supercoiling and replication to continue. This mechanism has been widely described in clinical pathogens, and low fluoroquinolone susceptibility has also been reported in lactic acid bacteria isolated from seafood (22).

These target-based resistance strategies are not limited to pathogenic microorganisms. There are discussions in the literature that probiotic LAB strains possess similar mechanisms and that these resistance traits may be mediated by horizontal gene transfer (23). Therefore, safety assessments of probiotic candidates should consider not only phenotypic susceptibility but also genomic analysis of target site mutations. Thus, the distinction between intrinsic and mobile gene-mediated resistance can be made clearly and the risks of ARG spread in the food chain can be managed more accurately.

2.3. Efflux Pump Activity

Efflux pumps are an important resistance mechanism that actively transports antibiotics out of cells, preventing effective intracellular accumulation. These systems operate via ATP-dependent transporters (ABC transporters) or proton-motive pumps and play a role in resistance, particularly to tetracycline and macrolide antibiotics (24). Although efflux pumps are generally associated with low-level resistance, when the genes encoding these pumps reside on mobile genetic elements such as plasmids or transposons, resistance can be transferred to different species, potentially leading to multidrug resistance. Therefore, the presence of an efflux mechanism is considered a parameter that should be carefully monitored in the biosafety assessment of probiotic strains isolated from seafood.

2.4. Mobile Genetic Elements: Plasmids, Transposons and Integrons

Acquired antibiotic resistance genes are often transmitted via mobile genetic elements (MGE). These elements include plasmids, transposons, integrons, and bacteriophages, and they facilitate gene exchange between bacterial species. This allows resistance genes to be transferred both from probiotic strains to potential pathogens and from environmental bacteria to the food microbiota (20). This process, which occurs through horizontal gene transfer, can facilitate the rapid spread of resistance genes and the development of multidrug resistance. Therefore, EFSA and WHO recommend the use of strains carrying antibiotic resistance genes carried on plasmids or transposons as probiotics, starter cultures, or feed additives, and recommend meticulous genomic screening and strain selection for safe applications.

Table 1. Antibiotic Resistance Mechanisms and Sample Genes in Seafood-Derived Probiotics

Resistance Mechanism	Detail	Example Resistance Genes / Enzymes	Related Antibiotics	References
Enzymatic inactivation	Degradation or chemical modification of the antibiotic	ESBL (bla_CTX-M), bla_NDM, CAT	β-lactams, aminoglycosides, chloramphenicol	16-18
Target change / preservation	Mutation or modification of the target site to which the antibiotic binds	mecA, gyrA, parC	β-lactams, fluoroquinolones	20-23
Efflux pumps	Antibiyotiğin hücre dışına aktif olarak atılması	tetA, mefA, ermB	Tetracyclines, macrolides	24
Mobile genetic elements	Transferable plasmid, transposon, integron carriage	Tn916, IS1216, Integron class 1	Multidrug resistance (MDR)	20

3. Prevalence of Resistance Genes in LAB Isolated from Seafood

In recent years, the number of studies evaluating the microbial safety profiles of lactic acid bacteria (LAB) isolated from seafood has increased significantly. These studies have shown that while many isolated strains possess probiotic properties, some may also possess single or multiple antibiotic resistance phenotypes. Resistance genes, particularly those carried on mobile genetic elements, pose a critical risk to food safety because they can be transferred to the environmental microflora or potential pathogens (20).

Phenotypic assessments have reported varying levels of resistance to tetracycline, erythromycin, chloramphenicol, streptomycin, and penicillin antibiotics in LAB strains recovered from seafood (25). These resistance patterns vary widely among species used as probiotics, such as Lactobacillus, Lactococcus, Enterococcus, and Pediococcus (26). Tetracycline and macrolide resistance, in particular, has been reported as the most common phenotype in many studies and has been found to be consistent with efflux pumps and ribosomal target switching mechanisms.

Molecular analyses frequently confirm the presence of specific antibiotic resistance genes (ARGs) in strains with observed phenotypic resistance. The most frequently detected genes in LAB isolated from seafood include tet(M), tet(S), tet(L) (tetracycline resistance), erm(B) and mef(A) (macrolide/erythromycin resistance), the bla family (β-lactam resistance), and cat (chloramphenicol resistance). Some of these genes, particularly tet(M) and erm(B), are noteworthy because they can be transferred between both probiotic LAB and pathogenic bacteria via conjugative elements (27).

Metagenomic data also support these findings. The MicroBIGG-E database shows that microorganisms isolated from fish and shellfish frequently carry clinically critical ARGs such as bla_NDM (carbapenemase), mcr (colistin resistance), tetX (tigecycline resistance), and vanA (glycopeptide/vancomycin resistance) (28). These genes are associated with reserve or last-resort antibiotics by the WHO and are of particular importance for the spread of resistance throughout the food chain. The isolation of strains carrying mcr and bla_NDM from seafood represents a significant public health risk (29).

Table 2. Major Resistance Genes in LAB Strains Isolated from Seafood

Type	Identified Resistance Genes	Transport Type (Plasmid/Transposon)	Most Resistant Antibiotics	References
Lactobacillus spp.	tet(M), erm(B)	Plasmid, Tn916	Tetracycline, Erythromycin	30
Enterococcus spp.	vanA, bla, tet(L)	Plasmid, Integron	Vancomycin, β-lactam	29
Pediococcus spp.	mef(A), cat	IS elements	Macrolides, Chloramphenicol	31
Lactococcus spp.	tet(S), erm(B)	Conjugative transpozone	Tetracycline, Macrolides	32

4. Regulation and Security

The safe use of seafood-derived probiotics is closely linked not only to their technological performance but also to the potential for the spread of antibiotic resistance genes (ARGs) they carry. Therefore, regulatory authorities have tightened evaluation criteria in recent years, explicitly limiting the use of strains carrying mobile ARGs in food or feed additives (29). The primary objective is to minimize potential risks to public health while preserving the functional benefits of probiotic applications. EFSA's QPS (Qualified Presumption of Safety) approach emphasizes three fundamental conditions for safety in probiotics: that the strains have no pathogenic potential, that they do not produce toxins, and that ARGs are not located on mobile genetic elements (29). While many lactic acid bacteria strains on the QPS list are considered safe, screening for ARGs at the strain level is mandatory, and resistance genes located on plasmids or transposons invalidate this status.

Similarly, the WHO and FAO recommend phenotypic antibiotic susceptibility testing, genomic analysis, and conjugation potential assessments for the safe use of probiotics (33). A critical point is that the presence of a resistance gene in a strain does not alone constitute a risk; the risk is determined by whether the gene is mobile. Therefore, current guidelines recommend the removal of strains carrying mobile ARGs from marketed products, fermentation starter cultures, and aquaculture feeds (29). In contrast, intrinsic and non-mobile resistance traits (e.g., vancomycin resistance in Lactobacillus rhamnosus) are generally considered safe and are not excluded from the QPS framework (34).

Modern safety assessments are no longer limited to phenotypic testing. Whole-genome sequencing (WGS) has become a key component of strain selection, enabling the detection of ARGs, mobility islands, conjugative plasmid regions, and virulence and toxin genes with high sensitivity (35). This approach enables the elimination of risky strains early in product development. Furthermore, the regulatory framework is not limited to production but also encompasses final product labeling, traceability, and post-market inspection. Labeling the species and strain name, reporting antibiotic resistance markers, and ensuring product traceability are among the recommended practices by the FAO/WHO (33). The current risk assessment approach is based on three key steps: screening for strains carrying mobile ARGs through genomic screening, confirmation through phenotypic antibiotic susceptibility testing, and assessment of conjugation/transformation potential. This multi-layered framework ensures that probiotic strains can be used without posing risks to both food safety and public health.

5. Risk Reduction and Future Strategies

The risks associated with antibiotic resistance in seafood-derived probiotic strains can be managed with multifaceted strategies to both preserve functional advantages and ensure public health safety. The current approach focuses on selecting strains free of mobile resistance genes, reducing antibiotic use, implementing alternative biotechnologies, and strengthening systematic surveillance programs, rather than banning probiotic applications (29).

Reducing antibiotic use in aquaculture systems is the first and fundamental step in reducing the risk of AMR. Limiting the use of antibiotics for prophylactic and growth-promoting purposes, administering them only after veterinary diagnosis and prescription, and restricting the use of critical antibiotics are consistent with current policies in many countries (36). This approach, when supported by water quality management, stocking density control, vaccination, and biosecurity practices, significantly reduces the need for treatment (5).

The most critical issue for probiotic use is the safety-based selection of strains. Modern probiotic development programs have made whole genome sequencing (WGS) analyses mandatory, in addition to phenotypic susceptibility testing. This method allows for the highly sensitive detection of mobile ARGs, plasmid regions, conjugative elements, virulence factors, and toxin genes, enabling the selection of safe strains (35). Organic acids, phytobiotics, and bacteriophages are increasingly being evaluated as alternatives to antibiotics in aquaculture and food systems. Organic acids and plant compounds suppress pathogens by lowering intestinal pH and do not exert resistance selection pressure (37). Bacteriophages, on the other hand, have been effective in controlling species such as Salmonella, Aeromonas, and Vibrio, exhibiting specific effects on target pathogens, and the potential for synergistic use with probiotics has been reported (38). For all these applications to be effective, surveillance and monitoring structures must be developed. Microbial monitoring in fish farms, hygiene control in processing facilities, end-product testing, and post-market traceability reduce the risk of transmission of resistant bacteria throughout the food chain. (39) Many countries are now expanding their national AMR monitoring programs to include seafood and foods containing probiotics.

Finally, risk reduction strategies need to be integrated not only at the production or clinical level but also at the environmental and societal levels. Coordination, data sharing, and regulatory harmonization among veterinary health units, food safety agencies, and public health authorities are critical for long-term success in AMR management (39). Future research priorities include standardized protocols for mobile ARG detection, genomic characterization of novel probiotic strains, phage-probiotic combinations, and large-scale metagenomic surveillance. These studies will lay a strong scientific foundation for both sustainable aquaculture and safe food systems.

6. Conclusion

Probiotic strains derived from seafood offer significant benefits such as pathogen inhibition, intestinal health support, and immune modulation in aquaculture and functional food production. These microorganisms enhance production performance, improve product quality, and are compatible with sustainable farming objectives. However, recent studies have shown that some probiotic strains may carry intrinsic or acquired antibiotic resistance genes (ARGs), and that these genes can be transferred to other microorganisms via mobile genetic elements. This presents a biosecurity risk that should be considered not only for the target organisms but also for the food chain and public health.

Resistance mechanisms can arise through various pathways, such as enzymatic inactivation, target modification, and efflux pumps. It is known that ARGs, particularly those carried via plasmids, conjugative transposons, and integrons, facilitate horizontal gene transfer. Therefore, the safe use of probiotic strains should be evaluated by focusing on the mobility potential of resistance genes. Current guidelines do not strictly recommend the use of strains containing mobile ARGs as probiotics, starter cultures, or feed additives. However, non-mobile strains with intrinsic resistance profiles can be safely administered with appropriate screening procedures.

In this context, phenotypic antibiotic susceptibility testing and whole-genome sequencing (WGS) have become integral parts of strain selection. WGS strengthens risk management by providing the ability to identify mobile ARGs, virulence factors, and conjugation islands with high sensitivity. Furthermore, reducing antibiotic use, environmental monitoring, organic acid and bacteriophage applications, competitive exclusion strategies, and biosafety protocols stand out as effective tools to reduce resistance selection in aquaculture systems.

In conclusion, seafood-derived probiotics have the potential to be safe and effective ingredients with appropriate strain selection and regulatory control. Striking a balance between functional benefits and microbial safety, consistent with the One Health approach, requires a holistic assessment of environmental, animal, and human health. Future work is expected to focus on standardized methodologies for mobile ARG screening, expanding metagenomic surveillance networks, and developing alternative biotechnological solutions. These efforts will contribute to global antimicrobial resistance management and establish a strong scientific basis for sustainable aquaculture and safe food production.

ÖZET

Dünya nüfusunun hızla artmasıyla birlikte insanlığın en önemli gündemi sağlıklı beslenme haline gelmiştir. Dünyada sağlık problemleri arasında yetersiz ve dengesiz beslenme, GDO'lu ürünlerin insan sağlığına olumsuz etkileri en önemli konular olarak karşımıza çıkmaktadır. Tüketilen besinlerin sağlıklı koşullarda yetiştirilmesi büyük önem arz etmektedir. Covid-19 pandemisi ile Dünya'da gıda sektörünün önemi bir kez daha anlaşılmıştır. Bununla birlikte tarımda seraların ve seracılık işletmeleri faaliyetlerinin artmasına neden olmuştur. Bu çalışma, Türkiye'de seracılığın yoğun olarak yapıldığı Adana İl'i merkez ilçelerindeki seracılık işletmelerinin ve işletmelerde bulunan seraların mevcut durumlarının belirlenmesi, yapısal yönden incelenmesi ve sorunların tespit edilerek çözüm önerilerinin geliştirilmesi amacıyla 2019-2020 yılları arasında yürütülmüştür. Araştırmada, Adana ili merkez ilçeleri Seyhan, Yüreğir, Sarıçam ve Çukurova'da bulunan sürekli ve ticari olarak yetiştiricilik yapılan, yapı özellikleri, üretilen ürünler ve üretim şekli yönünden birbirinden farklı, yöreyi temsil niteliğine sahip 27 adet seracılık işletmesi amaçlı örnekleme metoduyla seçilerek incelenmiştir. Çalışmanın yürütüldüğü seracılık işletmelerinin özelliklerinin belirlenmesi amacıyla yüz yüze anket çalışması, yerinde ölçümler ve fotoğraf çekimi gerçekleştirilmiştir. Araştırma sonucunda, incelenen seracılık işletmelerinin %11'inin arazi varlığının 10 da ve altında, %11'inin 11-20 da arasında, %49'unun 21-50 da arasında, %11'inin 51-100 da arasında, %18'inin 100 da'dan büyük olduğu belirlenmiştir. Araştırmanın yürütüldüğü seracılık işletmelerinin sahiplerinin %60'ının lisans ve lisansüstü eğitime sahip olduğu belirlenmiştir. Araştırma alanında seracılık işletmelerinde; %40'ında muz, %60'ında ise domates, çilek, üzümsü meyveler, hıyar, süs bitkileri ve ejder meyvesinin yetiştirildiği tespit edilmiştir. İşletme sahiplerinin eğitim düzeyinin yüksek olduğu seracılık işletmelerinin teknoloji kullanım düzeyinin daha yüksek olduğu ve modern bir yapıya sahip oldukları belirlenmiştir. Seracılık işletmelerinin nicelik ve niteliğinin artırılması; seracılık işletmelerin özelliklerini inceleyen, yapısal ve iklimsel yeterliliklerinin iyileştirilmesi için yapılacak çalışmalarla gerçekleştirilecektir. Sonuç olarak, seracılık işletmelerinin kurulacak bölgenin özelliklerine uygun olarak özel tasarlanmış seralarda yetiştiricilik yapması tavsiye edilmektedir.

Anahtar Kelimeler: Adana, Sera, seracılık işletmesi, sürdürülebilir tarım.

*Bu çalışma Emine Balı nın S.Ü. BAP Koordinatörlüğü tarafından 19201077 nolu proje ile desteklenen yüksek lisans tezinin bir kısmından üretilmiştir.

EVALUATION OF GENERAL CHARACTERISTICS OF GREENHOUSE ENTERPRISES IN CENTRAL DISTRICTS OF ADANA PROVINCE*

ABSTRACT

The rapid increase in the world population has made healthy nutrition one of humanity's most critical priorities. Among global health problems, inadequate and unbalanced nutrition, along with the negative effects of GMO products on human health, stand out as major concerns. Ensuring that all consumed food is produced under healthy conditions is therefore essential. The Covid-19 pandemic further emphasized the importance of the global food sector and led to a rise in greenhouse construction and greenhouse farming activities. This study was carried out between 2019 and 2020 in the central districts of Adana Province, where greenhouse cultivation is highly intensive in Turkey. The aim was to determine the current situation of greenhouse enterprises and their structures, identify their problems, and develop solution proposals. Using purposive sampling, 27 greenhouse enterprises engaged in continuous commercial production and representing the region in terms of structural characteristics, crop types, and production methods were selected from Seyhan, Yüreğir, Sarıçam and Çukurova districts. To identify enterprise characteristics, face-to-face interviews, on-site measurements and photographic documentation were conducted. The results indicated that 11 percent of the enterprises had land areas of 10 decares or less, 11 percent between 11 and 20 decares, 49 percent between 21 and 50 decares, 11 percent between 51 and 100 decares, and 18 percent larger than 100 decares. It was also found that 60 percent of greenhouse owners held undergraduate or graduate degrees. In the study area, 40 percent of the enterprises grew bananas, while 60 percent produced tomatoes, strawberries, berries, cucumbers, ornamental plants and dragon fruit. Enterprises owned by individuals with higher educational levels tended to use technology more effectively and maintained more modern greenhouse structures. Strengthening the number and quality of greenhouse enterprises depends on research that examines their characteristics and enhances their structural and climatic capacities. Therefore, it is recommended that greenhouse facilities be designed and constructed according to the specific environmental conditions of the regions in which they are established.

Keywords: Adana, Greenhouse, greenhouse business, sustainable agriculture

INTRODUCTION

Greenhouses are enclosed structures that provide regulated growing conditions, allowing fruit and vegetable production outside natural seasons through highly light-transmissive covering materials (Güllüler, 2007). They are defined as high-system covered environments that enable year-round cultivation and seedling production by operating climate-control systems independent of external weather conditions. These structures are constructed using materials with high light transmittance such as glass, plastic, and fiberglass and may also serve storage or demonstration purposes (Anonymous, 2001). Greenhouse cultivation is practiced in many regions across the world. Countries with advanced greenhouse technologies include the United States, the Netherlands, Japan, the United Kingdom, Belgium, France, Italy, Germany, Denmark, Sweden, and several Eastern European nations (Yağanoğlu, 2008).

In Turkey, greenhouse production began in the 1940s in Antalya through the establishment of glass greenhouses. Greenhouse cultivation experienced its least active period between 1940 and 1960 (Tüzel et al., 2005). The most rapid development occurred after the 1970s (Öneş, 1986). One of the primary drivers of this advancement was the replacement of costly glass coverings with polyethylene (PE), a lightweight, economical, and easy-to-apply plastic material (Çolak, 2002). Substantial increases in greenhouse areas took place between 1975 and 1985, and total greenhouse area expanded by 64.5% between 1990 and 1997 (Tüzel & Eltez, 1997; Sevgican, 2000). Although greenhouse cultivation experienced a contraction in 2001 due to economic recession, the overall expansion trend continued. As cold winters adversely affect open-field production, protected cultivation has gained importance. Parallel to Turkey's growing population, greenhouse activities have continued to accelerate. While Turkey's total protected cultivation area was 643,442 hectares in 2014, it reached 776,109 hectares in 2024. Due to the high construction costs of glass greenhouses, their share declined from 80,975 ha in 2014 to 55,945 ha in 2024. In contrast, the area covered by plastic greenhouses increased from 298,651 ha to 452,907 ha during the same period. In 2014, low and high tunnels in Turkey occupied 156,720 ha and 107,095 ha, respectively, while in 2024 these values shifted to 163,275 ha for low tunnels and 103,275 ha for high tunnels. During the COVID-19 pandemic in 2020, Türkiye's agricultural sector demonstrated rapid growth. As a result, the total greenhouse area reached 508,856 ha in 2024. The temperate climate zone remains the most suitable geographical region for greenhouse operations (Yağanoğlu, 2008).

Today, greenhouses are widely distributed globally. Worldwide greenhouse cultivation covers approximately 800,000 ha, with the majority located in Mediterranean countries. Of this total, 85% of greenhouse areas are covered with plastic materials, while 15% utilize glass coverings (Silleli et al., 2020). In Turkey, the total protected cultivation area amounts to 776,109 ha, consisting of 59% (452,907 ha) plastic greenhouses, 7% (55,949 ha) glass greenhouses, 21% (163,275 ha) low tunnels and 13% (103,978 ha) high tunnels (TÜİK, 2025a). This study was conducted to examine the general characteristics and adequacy of greenhouse enterprises in the central districts of Adana Province, a region where greenhouse cultivation is intensively practiced, and to identify existing problems while proposing potential solutions.

MATERIALS AND METHODS

This study was conducted between 2019 and 2020 in 27 greenhouse enterprises located in the central districts of Adana Province, namely Seyhan, Yüreğir, Sarıçam, and Çukurova. A face-to-face survey was administered to determine the general characteristics of the enterprises, while observations, measurements, and photographic documentation were utilized to further examine their structural features.

The research methodology consisted of two stages: fieldwork and office-based analysis. The field stage involved selecting enterprises, conducting face-to-face surveys, performing on-site studies within greenhouse facilities, and making preliminary evaluations of the collected data. The office stage focused on the detailed assessment and interpretation of the information obtained during fieldwork.

A standardized survey form was prepared to ensure consistency across all participating enterprises. The survey included questions on the general characteristics of the enterprises, the structural features of the buildings within them, production-related information, and the problems encountered by operators. Additionally, measurements, sketches, plan drawings, and photographs were collected to more accurately document and describe the structures and facilities within each greenhouse enterprise.

RESULTS AND DISCUSSION

General characteristics of greenhouse enterprises

This study was conducted in 27 greenhouse enterprises located in the central districts of Adana Province, namely Seyhan, Sarıçam, Yüreğir and Çukurova. The distribution of enterprises across districts is presented in *Table 1*. Among the investigated enterprises, 51% were located in Seyhan, 30% in Sarıçam, 15% in Yüreğir and 4% in Çukurova. The high number of greenhouse enterprises in Seyhan can be attributed to its extensive availability of agricultural land (TÜİK, 2025b). As of 2024, greenhouse activities in Sarıçam District cover an area of 999 da which is supported by the district's large total land capacity of 422,915 da (TÜİK, 2025c).

Table 1. Distribution of greenhouse enterprises in the study according to central districts of Adana Province

District	Number of Enterprises (n)	Percentage (%)
Seyhan	14	51
Sarıçam	8	30
Yüreğir	4	15
Çukurova	1	4
Total	**27**	**100**

The distance of the greenhouse enterprises from the center of Adana Province ranged from 0.5 to 40 km. It was determined that 15% of the enterprises were located less than 5 km from the provincial center and 77% were situated 5 to 30 km away. Within this group, 25% were located 5 to 20 km from the center, 22% were located 10 to 20 km away and 30% were situated 20 to 30 km from the provincial center. Additionally, 8% of the enterprises were located more than 30 km away, with distances reaching up to 40 km. Greenhouses should ideally be established in easily accessible areas and distant from noisy environments (Hakgören & Kürklü, 2004).

The distance of the investigated enterprises to the nearest main road ranged from 0 to 13 km. Since these enterprises were located in central districts, transportation was generally convenient. Thirty-three percent of the enterprises (numbers 9, 11, 12, 13, 16, 24, 25, 26 and 27) were situated less than 0.5 km from a main road. Only one enterprise was found to be 13 km away from the nearest road. Excessive distance from main roads may lead to problems such as limited access, difficulty obtaining emergency support and potential damage to transport vehicles due to poorly maintained routes. Therefore, greenhouse enterprises should be

established in locations with easy access to main roads and nearby settlements. Uğurlu and Uzal Seyfi (2010) similarly reported that locating greenhouses close to main roads and settlements facilitates transportation and marketing. According to the *"Covered Agriculture Registration System Regulation,"* greenhouses must be established near secondary or main roads (Anonymous, 2014).

Sources of project financing among the greenhouse enterprises were classified as self-funded, publicly supported and leased enterprises. Of the investigated enterprises, 67% were established with the owner's own capital and project initiative, 22% were supported through public funding and 7% were financed through a combination of public support and personal capital. Only one enterprise was identified as leased. Financing structure plays a critical role in greenhouse establishment. In this study, publicly supported greenhouses were observed to be more professionally constructed, whereas self-funded enterprises tended to minimize costs and consequently built greenhouses with inadequate equipment and workmanship. Güllüler (2007) reported that greenhouse operators in Adana Province frequently attempted to reduce installation expenses by avoiding engineering services, deviating from appropriate plans and having greenhouses constructed by metalworkers lacking expertise in greenhouse structures. Similar practices were identified in this study.

It was also observed that greenhouses established through a combination of public support and personal capital possessed more professionally designed plans and construction projects. Conversely, many self-funded greenhouses were found to be technologically insufficient and lacked automation systems. Güllüler (2007) likewise noted that non-professional construction practices were common in Adana due to attempts to reduce initial investment costs.

Table 2. Project financing sources of the investigated greenhouse enterprises

Establishment Type	Source of Project	Number (n)	Percentage (%)
Self-funded	Based on his/her own idea	18	67
Public-supported	Public project	6	22
Leased	Based on his/her own idea	1	4
Public + self	Based on his/her own idea	2	7
Total		**27**	**100**

The establishment years of the investigated enterprises ranged from 1989 to 2020. Eleven percent of these enterprises (numbers 7, 12 and 22) were established in 1990 or earlier (1980 and 1989). No enterprises were founded between 1991 and 2000. It was determined that 85% of the enterprises were established between 2001 and 2020, and only one enterprise was founded after 2020. Owners of older greenhouses reported that renovation was needed but could not be carried out due to high costs. Greenhouses established after 2010 were observed to be more technologically advanced and equipped with improved automation systems.

The land size of the investigated greenhouse enterprises ranged from 8 to 260 da (Table 3). The average land size was 61.30 da, while the average greenhouse area was 9.76 da. Eleven percent of the enterprises had less than 10 da, 11% had 11 to 20 da, 11% had 51 to 100 da and 11% had 101 to 150 da. Nearly half of the enterprises (49%) had land areas between 21 and 50 da. During interviews, enterprise owners stated that they wished to expand their production areas and increase greenhouse capacity.

Table 3. Distribution of Greenhouse Enterprises by Land Size

Land Size (da)	Number (n)	Percentage (%)
≤10	3	11
11–20	3	11
21–50	13	49
51–100	3	11
101–150	3	11
>150	2	7
Total	**27**	**100**

The education levels of the enterprise owners were determined as follows: 15% had primary education, 22% had secondary education, 59% held undergraduate degrees and 4% held postgraduate degrees (Figure 1). Higher education among enterprise owners was found to contribute to a more professional outlook, the employment of qualified personnel and the application of more informed agricultural practices. Many of the owners with undergraduate degrees were agricultural engineers with the necessary expertise in plant production and cultivation. Their involvement was observed to positively influence agricultural practices within the region. Emekli (2007), in a study conducted in the Kumluca District of Antalya, similarly noted that increased producer awareness led to more informed agricultural practices and contributed to improved greenhouse activities. These findings emphasize the importance of expertise in greenhouse cultivation.

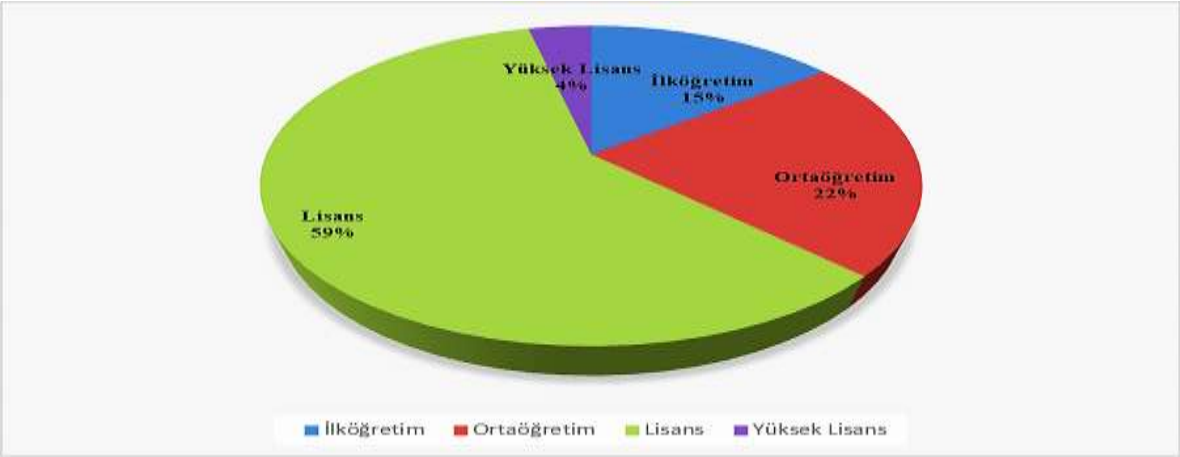

Figure 1. Educational status distribution of greenhouse enterprise owners

The number of personnel employed in the greenhouse enterprises examined in this study ranged from 1 to 48 individuals. In 41% of the enterprises, the number of employees was 1 or 2; in 34% it ranged between 3 and 10; in 11% it ranged between 16 and 20; and in 7% of the enterprises, the total number of workers was 48. The number of workers in greenhouse enterprises varies according to production intensity and enterprise size. The findings indicated that daily wage practices are still in use in greenhouse operations. Among the examined enterprises, both full-time personnel and workers residing overnight on site as guards were identified.

The working hours of employees in the investigated greenhouse enterprises were generally similar, typically ranging between 07:30 and 17:00, 07:00 and 17:30, or 08:00 and 18:00.

Table 4. Distribution of greenhouse enterprises by number of employees

Number of Employees	Number of Enterprises (Units)	Percentage (%)
<3	11	41
3–6	6	23
7–10	3	11
11–15	–	0
16–20	3	11
21–25	2	7
>25	2	7
Total	**27**	**100**

It was observed that the greenhouse enterprises examined in the study primarily grew bananas (15 enterprises) and also cultivated tomatoes, cucumbers, strawberries, berry fruits and dragon fruit. Additionally, 22% of the enterprises were engaged in seedling production, while 19% were established for demonstration purposes. In the greenhouses where seedling production was carried out, various seedlings including tomato, pepper, eggplant, cucumber, lettuce, watermelon and melon were produced. It was determined that only one greenhouse was established for research purposes, specifically for breeding activities. In this enterprise, ornamental plant production was also undertaken alongside breeding studies. Furthermore, it was observed that only one greenhouse was used for exhibition purposes.

Table 5. Distribution of the ınvestigated greenhouse enterprises by establishment purpose

Establishment Purpose	Number of Enterprises (Units)	Percentage (%)
Seedling Production	6	22
Cultivation	15	55
Research (Breeding)	1	4
Exhibition	5	19
Total	**27**	**100**

The marketing of products produced in the examined greenhouse enterprises was carried out through four main methods: direct sales from the greenhouse (retail), storage in cold rooms, wholesale and export. Direct sales referred to the purchase of ornamental plants directly from the greenhouse by customers. Storage in cold rooms was applied in banana-producing enterprises, enabling products to be marketed at more profitable prices during periods of low banana supply. Wholesale marketing occurred when buyers purchased all or a large portion of production either by placing an order or by visiting the enterprise. Export involved the sale of the entire greenhouse output to foreign markets.

Among the enterprises studied, 49% of products were marketed through wholesale channels, 40% through direct sales at the greenhouse and 7% through cold storage. Due to the perishable nature of certain products such as seedlings and bananas, their storage and preservation are challenging, requiring rapid marketing and delivery to consumers (Çimen, 2001).

Table 6. Distribution of the ınvestigated greenhouse enterprises by product marketing system

Product Marketing System	**Number of Enterprises (Units)**	**Percentage (%)**
Direct sales from greenhouse (retail)	11	40
Storage in cold rooms	2	7
Wholesale	13	49
Export	1	4
Total	**27**	**100**

Recommendations

The beginning of the new century has brought increasing emphasis on agricultural systems in which seeds are produced under certified conditions, measures are taken against diseases and pests, safe and clean food is ensured, climate control and energy resources are efficiently managed, and environmentally friendly production methods are adopted. As a result, sustainability has emerged as a key parameter for both environmental protection and human health. Ensuring that food is produced under optimal conditions highlights the importance of greenhouse enterprises, which make year-round agricultural production possible.

The need for greenhouse enterprises to operate in structurally adequate, modern facilities with a high level of technological integration has therefore increased. Ultimately, greenhouse cultivation in the Adana Region contributes substantially to both regional and national economic development. For this reason, it is recommended that greenhouse enterprises adopt cultivation practices in specially designed structures suited to the environmental characteristics of the regions in which they are established.

ÖZET

Son yıllarda iklim değişikliği ve küresel ısınmaya neden olan karbon ayak izinin etkileri oldukça önemli bir konudur. Hayvancılık sektöründe faaliyet gösteren işletmelerde üretimden, enerji kullanımından ve gübre yönetiminden kaynaklı karbon salınımları gerçekleşmektedir. Bu salınımların sebep olduğu etkilerin bilinmesi, oluşabilecek zararlı etkilerin ortadan kaldırılması veya azaltılmasına yönelik uygulamaların geliştirilmesi; çevrenin korunması ve hayvancılık faaliyetlerinin daha sağlıklı yürütülebilmesi açısından oldukça önemlidir. Bu araştırma, Türkiye'de yumurta tavukçuluğu yetiştiriciliğinde 3. Sırada yer alan Konya bölgesinde faaliyet gösteren yumurta tavukçuluğu işletmelerinden kaynaklı karbon ayak izi değerlerinin IPCC yaklaşımına göre TİER1 Metodu kullanılarak hesaplanması ve toplam karbondioksit salınım değerlerinin yoğunluk haritasının oluşturulması amacıyla, 2023-2024 yılları arasında Konya Bölgesinde yürütülmüştür. Araştırmada, Konya Bölgesinde faaliyet gösteren tüm yumurta tavukçuluğu işletmelerinden kaynaklı karbon ayak izi değerlerinin Uluslararası İklim Değişikliği Paneli (IPCC) yaklaşımına göre TİER1 Metodu kullanılarak hesaplanması için; Konya Bölgesinde bulunan tavukçuluk işletmelerinin envanteri çıkarılmıştır. İlgili Kamu ve özel kuruluşlarla görüşülerek Bölgede faaliyet gösteren yumurta tavukçuluğu işletmelerine ait veriler (işletme özellikleri, kümes planlama sistemleri, hayvan sayıları, gübre yönetim uygulamaları...) alınmıştır. TİER metotları kullanılırken IPCC 2023 kılavuzunda yer alan Türkiye'nin ve araştırmanın yürütüldüğü Konya bölgesinin iklim özellikleri, hayvan türü, üretim verimliliği ve gübre yönetimi gibi işletmenin ve hayvancılık faaliyetlerinin özelliklerine göre önerilen değerler kullanılarak hesaplanmış, işletmelere ve işletmelerdeki hayvanlara ait karbon ayak izi miktarları belirlenerek, araştırma bölgesi olan Konya İli ve İlçeleri için detaylı karbondioksit salınımı (küresel ısınma potansiyeli) yoğunluk haritası oluşturulmuştur. Konya Bölgesinde (İli ve ilçeleri) 7,25 milyon adet yumurta tavuğundan kaynaklanan yıllık toplam 4.5 Gg (4,5 milyon kg) CO_2e salınımı (CH_4: %57; N_2Odirect: %18,7; N_2Ouçucu hale gelme: %36) değerleri hesaplanmıştır. Araştırma sonucunda Konya Bölgesindeki yumurta tavukçuluğu işletmelerinin tamamında yetiştirilen hayvanlar dikkate alınarak TİER1a metoduna göre karbon ayak izi; 0,62 kg CO_2e /tavuk, 4,13 kg CO_2e /kg gübre olarak hesaplanmıştır. Konya bölgesi için 2024 yılına ait küresel ısınma potansiyeli yoğunluk haritası oluşturulmuştur. Konya Bölgesinde 2024 yılı yumurta tavukçuluğu işletmelerinin gübre yönetiminden kaynaklı yaklaşık 4,5 Gg CO_2/yıl salınım gerçekleştiği hesaplanmıştır. Konya Bölgesinde Karatay, Meram, Kulu, Selçuklu, Akşehir ilçelerinin yumurta tavukçuluğu yetiştiriciliğinden kaynaklı CO_2 salınım miktarlarının yüksek olduğu belirlenmiştir.

Anahtar Kelimeler: Karbon ayak izi, karbon salınımı, Konya, yumurta tavukçuluğu.

*Bu çalışma Yasemin KOCAMAN'ın doktora tezinin bir kısmından üretilmiştir.

CONTRUCTION OF A CARBON EMISSION DENSITY MAP FOR LAYER HENS FARMS IN KONYA PROVINCE AND ITS DISTRICTS VIA THE TIER 1 METHODOLOGY*

ABSTRACT

In recent years, the impacts of the carbon footprint, which causes climate change and global warming, have become a subject of significant importance. In livestock enterprises, carbon emissions occur due to production processes, energy consumption, and manure management. Understanding the effects of these emissions and developing practices to eliminate or mitigate potential adverse impacts is crucial for environmental protection and ensuring the sustainable operation of livestock activities. This study was conducted in the Konya region, which ranks third in egg-layer poultry production in Turkey, between 2023 and 2024. The objective was to calculate the carbon footprint values originating from egg-layer poultry enterprises in the region using the TIER1 Method according to the IPCC approach and to create a density map of the total carbon dioxide emissions. For this purpose, an inventory of poultry operations in the Konya region was compiled. Data pertaining to the egg-layer poultry enterprises operating in the region (including enterprise characteristics, housing systems, animal numbers, and manure management practices) were obtained through consultations with relevant public and private institutions.The calculations employing the TIER methods utilized the default values recommended in the IPCC 2023 guidelines, which are specific to the climatic conditions of Turkey and the Konya region, as well as the characteristics of the enterprises and livestock practices, such as animal type, production efficiency, and manure management. The carbon footprint quantities for the enterprises and their animals were determined, and a detailed carbon dioxide emission (global warming potential) density map was created for the Konya province and its districts, which constituted the research area. The calculations for the Konya region (the province and its districts) estimated an annual total emission of 4.5 Gg (4.5 million kg) of CO_2e originating from 7.25 million egg-laying hens. The contribution of various gases to this total was calculated as follows: CH_4: 57%; direct N_2O: 18.7%; and N_2O from volatilization: 36%. The study found that, considering all animals reared in the egg-layer poultry enterprises across the Konya region, the carbon footprint according to the TIER1a method was calculated as 0.62 kg CO_2e per bird and 4.13 kg CO_2e per kg of manure. A global warming potential density map for the year 2024 was generated for the Konya region. It was determined that manure management in the region's egg-layer poultry enterprises resulted in approximately 4.5 Gg CO_2e per year. The districts of Karatay, Meram, Kulu, Selçuklu, and Akşehir were identified as having high CO_2 emission levels due to egg-layer poultry farming.

Keywords: Carbon footprint, Carbon emissions, Konya, Egg poultry farming.

*This study was derived from a portion ofYasemin KOCAMAN’s pHD Thesis.

INTRODUCTION

The impact of human activities on nature has increased since the Industrial Revolution. The intensive use of fossil fuels in areas such as energy consumption, transportation, agriculture, and industry leads to significant greenhouse gas emissions into the atmosphere. In this context, the "carbon footprint" concept has emerged as a crucial tool for measuring and managing environmental impacts.

The carbon footprint concept is a metric, typically calculated in carbon dioxide (CO_2) equivalent, that measures the direct and indirect greenhouse gas emissions released into the atmosphere by individuals, institutions, or activities. As a key indicator in the fight against global climate change, the carbon footprint plays a critical role in achieving sustainability goals, particularly in agricultural activities.

Global warming, on the other hand, is the process whereby greenhouse gases (CO_2 and CH_4) accumulating in the atmosphere due to human activities artificially increase the planet's temperature (UN, 1992; IPCC, 2021). The increase in the concentration of these gases in the atmosphere is the primary cause of rising global temperatures. On farms, the *"carbon footprint",* expressed in CO_2 equivalent, is a measure of the damage caused by greenhouse gases resulting from fossil fuel use and human activities, quantified in units of carbon dioxide (Wiedmann and Minx, 2008; Kılıç and Amet, 2017).

In Turkey, studies on carbon footprint calculations and management have gained increasing momentum in recent years within the scope of the global fight against climate change. In this direction, legal regulations for monitoring, reporting, and reducing greenhouse gas emissions have been implemented by relevant public institutions, primarily the Ministry of Environment, Urbanization and Climate Change. Particularly with the *"Regulation on the Monitoring of Greenhouse Gas Emissions"* enacted in 2014, high-capacity enterprises were obligated to report their emissions, thereby establishing an institutional infrastructure for determining and managing the national carbon footprint (ÇŞİDB, 2014).

In sectors with high emission potential, such as industry, energy, transportation, and agriculture, voluntary carbon footprint calculations are conducted in accordance with international standards like ISO 14064 and the GHG Protocol. Furthermore, preparations for the establishment of the Turkish Emission Trading System (ETS) are ongoing, with the aim of integrating it into carbon market mechanisms (ISO, 2018).

The global number of egg-laying hens, based on 2023 data taken from FAO (2025), is presented in Table 1.1. The total number of egg-laying hens worldwide has reached 27.2 billion. Among these, China ranks first with approximately 5.2 billion hens (19.16%), constituting about one-fifth of the global total. It is followed by Indonesia (3.7 billion) and Pakistan (1.88 billion). Turkey, with 368.6 million hens, ranks 11th, possessing 1.35% of the world's chicken population. Turkey's chicken population places it among the developed countries and indicates a significant production capacity in the sector.

When all these data are evaluated together, it is observed that while Konya Province continues to play a strategic role in egg-laying chicken farming in Turkey, its relative importance within total poultry farming has decreased. This situation indicates that regional production dynamics, investment trends, and structural transformations in the sector have had varying impacts in different provinces. Furthermore, the production contraction experienced by Konya, especially after 2020, points to a process that needs to be addressed with more comprehensive analyses at the environmental, economic, or sectoral level.

This research was conducted to calculate the carbon footprint values originating from egg-laying hen operations in the Konya region using the TIER 1 Methodology according to the IPCC approach and to create a density map of the total carbon dioxide emission values.

MATERIALS AND METHODS

Konya Province is the largest province in Turkey by surface area, covering 38,873 km² (HGM, 2025). It is located in the southern part of the Central Anatolia Region, within the Konya subregion. Its southern and southwestern sections fall within the Mediterranean Region. The lands of Konya stretch across vast plains situated among the high mountains of Central Anatolia. The province is positioned between 36°41'–39°16' north latitude and 31°14'–34°26' east longitude, with an average elevation of 1,016 meters. It features a climate characterized by hot and dry summers and rainy winters (KİKTM, 2024).

According to the Address-Based Population Registration System, the population of Konya in 2024 is 2,330,024, constituting 2.7% of Turkey's population (85,664,944). In a comparison among provinces, Konya is the 6th largest city in Turkey by population. The population growth rate is increasing at a rate of 0.42%. With a surface area of 38,873 km², Konya is the largest city in Turkey. The population density is 59 persons per square kilometer (Anonymous, 2025c).

Konya Province is administratively composed of 31 districts. Numerous natural lakes and marshes are located within the provincial boundaries. Lake Tuz (Salt Lake), situated at the intersection of Konya, Ankara, and Aksaray provinces, is one of Turkey's significant salt sources. Lake Beyşehir is Turkey's third-largest and largest freshwater lake; it is of tectonic-karstic origin and holds national park status. Lake Suğla, located in the southwest of Konya, has fresh water and is important for irrigation and fisheries. Additionally, Lake Ilgın (Çavuşçu), Ereğli Akgöl, and Yunak Akgöl are other significant lakes within the province (KİKTM, 2024).

Due to its location in the Central Anatolia Region, Konya Province exhibits typical continental climate characteristics. Climatic data for Konya Province (for the years 1929-2025) is provided in Table 3.2. According to long-term averages for Konya Province, the mean annual temperature is 11.8°C, while the highest average temperature occurs in July and August at 30.2°C, with the absolute maximum temperature recorded as 40.9°C in August. The long-term average lowest temperature in the province is -4°C in January, and the absolute minimum temperature average is -8.2°C, also in January. The mean annual total precipitation is 327.6 mm, with the highest precipitation measured in May at 43.5 mm.

Türkiye's poultry inventory is presented in Table 1. The total poultry population in Turkey, according to 2024 data, is 384 million birds (TRGM, 2025). Konya Province's laying hen population is 7.25 million, which constitutes 6.65% of Turkey's total laying hen population of 109.1 million. According to 2024 data, the total poultry population in Turkey is 384.1 million birds. In Turkey, the number of laying hens is 109.1 million, while the number of broiler chickens is 270.5 million (TRGM, 2025). This situation indicates that Konya Province holds a significant position in the national capacity for commercial egg and broiler production.

Table 1. Poultry Population in Turkey, 2024 (TRGM, 2025)

Poultry Type	Number of Birds (head)	Percentage (%)
Broiler Chicken	270.526.611	70.42
Laying Hen	109.100.202	28.40
Turkey	2.826.858	0.74
Goose	1.303.026	0.34
Duck	389.957	0.10
Total Poultry (head)	384.146.654	100

Within Turkey's total poultry inventory, the largest share belongs to broiler chickens, with a 70.42% rate and 270 million birds (Table 1). Laying hens, with 109 million birds, constitute 28.40% of Turkey's total poultry inventory and represent the second largest poultry group in the sector. Among other poultry species: turkeys, with 2.8 million birds, account for 0.74% of Turkey's total poultry; geese, with 1.3 million birds, account for 0.34%; and ducks, with 389 thousand birds, account for 0.10%.

In determining the carbon footprint, while the Tier 1 method is generally used, if country-specific productivity parameters are available for the studied livestock type, the Tier 1a method is used instead of Tier 1 (IPCC, 2019).

$$CH_{4(mm)} = \left[\sum_{T,S,P} \left(N_{(T,P)} \bullet VS_{(T,P)} \bullet AWMS_{(T,S,P)} \bullet EF_{T,S,P} \right) / 1000 \right]$$

$CH_{4(mm)}$=[[$N_{(T,P)}$ * $VS_{(T,P)}$ * $AWMS_{(T,S,P)}$ * $EF_{(T,S,P)}$]/1000]

$CH_{4(mm)}$= CH_4 emissions from Manure Management in the country, kg CH_4 yr^{-1}

$N_{(T,P)}$= number of head of livestock species/category *T* in the country, for productivity system *P*, when applicable

$VS_{(T,P)}$ = annual average VS excretion per head of species/category *T*, for productivity system *P*, when applicable in kg VS $animal^{-1}$ yr^{-1} (Table 10.13a calculated by Equation 10.22a, IPCC, 2019)

$AWMS_{(T,S,P)}$= fraction of total annual VS for each livestock species/category *T* that is managed in manure management system *S* in the country, for productivity system *P*, when applicable; dimensionless, default regionally specific AWMS fractions are found in Tables 10A.6 through 10A.9 in Annex 10A.2 , IPCC, 2019)

$EF_{(T,S,P)}$ = emission factor for direct CH4 emissions from manure management system *S,* by animal species/category *T*, in manure management system *S*, for productivity system *P*, when applicable (Table 10.14), g CH_4 kg VS^{-1}

S = manure management system

T = species/category of livestock

P = high productivity system or low productivity system for use in advanced Tier 1a – omitted if using a simple Tier 1 approach

$$N_2O_{D(mm)} = \left[\sum_S \left[\sum_{T,P}\left((N_{(T,P)} \bullet Nex_{(T,P)}) \bullet AWMS_{(T,S,P)}\right) + N_{cdg(s)}\right] \bullet EF_{3(S)}\right] \bullet \frac{44}{28}$$

$N_2O_{Direct(mm)}$ = [[($N_{(T,P)}$ * $Nex_{(T,P)}$) * $AWMS_{(T,S,P)}$) + $N_{cdg(s)}$] * $EF_{3(S)}$] * (44/28)

$N_2O_{Direct(mm)}$ = Direct N_2O emissions from Manure Management in the country, kg N_2O yr^{-1}

$N_{(T,P)}$= number of head of livestock species/category *T* in the country, for productivity system *P*, when applicable

$Nex_{(T,P)}$= annual average N excretion per head of species/category *T* in the country, for productivity system *P*, when applicable in kg N $animal^{-1}$ yr^{-1}

$N_{cdg(s)}$ = annual nitrogen input via co-digestate in the country, kg N yr^{-1}, where the system (s) refers exclusively to anaerobic digestion

AWMS(*T,S,P*) = fraction of total annual nitrogen excretion for each livestock species/category *T* that is managed in manure management system *S* in the country, dimensionless; to consider productivity class *P*, if using a Tier 1a approach

$EF_{3(S)}$= emission factor for direct N_2O emissions from manure management system *S* in the country, kg N_2O-N/kg N in manure management system *S*

S = manure management system *S*

T = species/category of livestock *T*

P = productivity class, high or low, to be considered if using the Tier 1a approach *P*

44/28 = conversion of N2O-N(mm) emissions to N2O(mm) emissions

$$N_{volatilization-MMS} = \sum_S \left[\sum_{T,P}\left[\left(\left(N_{(T,P)} \bullet Nex_{(T,P)}\right) \bullet AWMS_{(T,S,P)}\right) + N_{cdg(s)}\right) \bullet Frac_{GasMS(T,S)}\right]\right]$$

$N_{volitilization-MMS}$ = [[($N_{(T,P)}$ * $Nex_{(T,P)}$) * $AWMS_{(T,S,P)}$) + $N_{cdg(s)}$] * $Frac_{GasMS(T,S)}$]

N volatilization-MMS = amount of manure nitrogen that is lost due to volatilisation of NH3 and NOx, kg N yr^{-1}

$N_{(T,P)}$= number of head of livestock species/category *T* in the country, for productivity system *P*, when applicable

$Nex_{(T,P)}$= annual average N excretion per head of species/category *T* in the country, for productivity system *P*, when applicable in kg N $animal^{-1}$ yr^{-1}

$N_{cdg(s)}$ = annual nitrogen input via co-digestate in the country, kg N yr^{-1}, where the system (s) refers exclusively to anaerobic digestion

AWMS(*T,S,P*) = fraction of total annual nitrogen excretion for each livestock species/category *T* that is managed in manure management system *S* in the country, dimensionless; to consider productivity class

$Frac_{GasMS(T,S)}$ = fraction of managed manure nitrogen for livestock category *T* that volatilises as NH_3 and NOx in the manure management system

In this research, following the IPCC approach for determining the carbon footprint, the Tier 1a method was used to determine the carbon footprint originating from laying hen operations in Konya Province and its districts, as well as the CH_4 and N_2O emissions from manure at these operations. A density map of the total CO_2 emissions originating from laying hen operations in Konya Province and its districts was created using the ArcGIS (ESRI) software.

RESULTS AND DISCUSSION

According to 2024 data obtained from the Provincial Directorate of Agriculture and Forestry, Statistics Branch Directorate, the number of chickens in layer hen enterprises across Konya's 31 districts and the preference for the cage system as the rearing method have been determined. The calculations for the enterprises were performed using the Tier 1a methodology, selecting the high-productivity class option. The cage system was chosen for these calculations because, in Konya Province, only 3% to 5% of the layer hen operations are free-range systems with litter; the manure management scenario assumed that manure was sent to a biogas plant every two days.

Tier 1a: Determination of the CO_2 Emission Map Calculated for Konya Province and its 31 Districts

The layer hen population calculated for the 31 districts of Konya Province was converted into annual CO_2 emissions using typical emission coefficients for high-productivity cage system operations. The map reveals a variation in emission quantities, ranging from low-capacity enterprises (Taşkent, Ahırlı, Halkapınar, Derbent, Derebucak) to very high-capacity integrated production regions (e.g., Karatay, Meram, Kulu, Selçuklu, Sarayönü, Çumra, Altınekin).

The map displays the CO_2 emissions calculated based on the layer hen population in the districts of Konya Province. According to the color scale on the map, darker-colored districts represent high carbon emissions, while lighter-colored districts represent low carbon emissions. The carbon emission map for the Konya region for the year 2024 is provided in Figure 1. The layer hen population calculated for the 31 districts of Konya Province was converted into annual CO_2 emissions using typical emission coefficients for high-productivity cage system operations. The map reveals a variation in emission quantities, ranging from low-capacity enterprises (Taşkent, Ahırlı, Halkapınar, Derbent, Derebucak) to very high-capacity integrated production regions (e.g., Karatay, Meram, Kulu, Selçuklu, Sarayönü, Çumra, Altınekin).

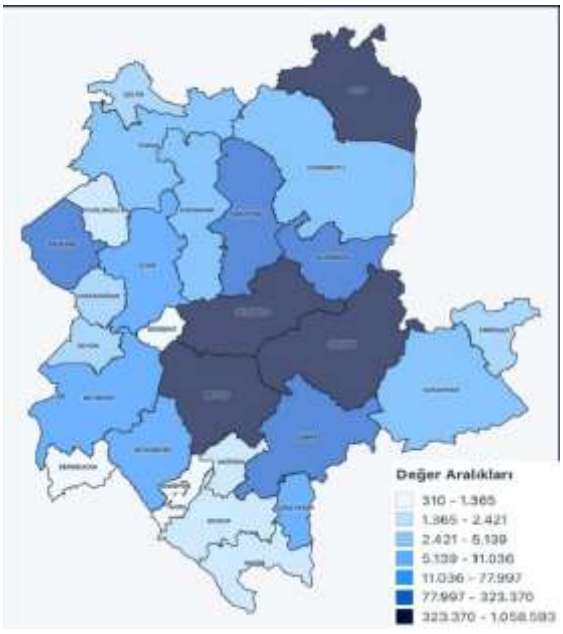

Figure 1. Carbon Emission Map for the Year 2024, Showing the 31 Districts of Konya Province.

Karatay (1,705,560 hens, 1,058,593 kg CO_2/year), Meram (1,536,500 hens, 953,662 kg CO_2/year), and Kulu (1,315,890 hens, 816,736 kg CO_2/year) are depicted in the darkest shade, indicating the districts with the highest carbon density in Konya. They are followed by Selçuklu, Sarayönü, and Çumra, which also stand out as significant emission centers due to the concentration of high-capacity cage system operations. Districts with medium tones, such as Altınekin, Güneysınır, Ereğli, and Akşehir, are areas with medium-capacity enterprises and moderate CO_2 emissions. In contrast, districts marked in the lightest shade, such as Taşkent, Ahırlı, Halkapınar, Derebucak, and Bozkır, are notable for their very low carbon emission values, owing to the prevalence of small-capacity enterprises. The overall total for Konya Province is approximately 4.5 Gg CO_2/year (4.5 million kg) produced from 7.25-million-layer hens. This distribution shows that emission density is higher in the dark-colored centers and that mitigation policies should be prioritized in these regions.

Tier 1a: CH_4 Emissions from Manure Management

For Regarding the laying hen farming activities carried out in 31 districts of Konya province, the manure management system value for the enterprises was taken as the amount of manure that has left the poultry house—either stored for transport to "Anaerobic Digestion - Biogas" biogas plants or used as fuel. For the manure management system to be calculated within the poultry houses, the Animal Waste Management System (AWMS) value of "Other (Poultry manure with litter)" for the laying hen animal category in the Eastern Europe region was taken as 19%. In the calculations, it was observed that methane (CH_4) emissions originating from manure management showed significant variation across districts.

As presented in Table 2, the laying hen population in the districts of Konya province and the resulting annual methane (CH_4) emission amounts and carbon dioxide (CO_2) equivalents are demonstrated.

The analysis of annual CH_4 emissions conducted across Konya Province calculated a total of 94,348.47 kg CH_4 emissions from 7,253,446 layer hens in 31 districts. Using the IPCC's 100-year global warming potential multiplier (GWP_{100} = 27 kg CO_2e/kg CH_4), a carbon equivalent of 2,547,408.78 kg CO_2e/year was obtained.

The emission distribution on a district basis is concentrated in Karatay (598,992.33 kg CO_2e; 23.3%), Meram (539,618.49 kg CO_2e; 21.0%), and Kulu (462,140.30 kg CO_2e; 18.0%), with these three districts alone accounting for approximately 62.3% of the total emissions. The average annual emission per animal across the province was calculated as 0.35 kg CO_2e/hen.

The findings indicate that in districts with high-density production, increasing methane capture efficiency through the widespread adoption of biogas integration and covered storage systems, as well as adopting advanced manure management techniques such as scraper belts and closed units, could significantly reduce the regional greenhouse gas load (IPCC, 2019).

These data clearly demonstrate how the regional distribution of layer hen enterprises in Konya Province affects greenhouse gas emission quantities and serve as a guide for local administrations and producers in determining regional priorities for reducing the carbon footprint. They show that egg production activities in Konya are concentrated in specific geographical regions and that greenhouse gas emissions align with this density. For effective greenhouse gas reduction strategies, focusing on high-capacity districts is crucial for the efficient management of the carbon footprint.

Tier 1a: N_2O Emissions from Manure Management

Direct N_2O Emissions

Using 2024 layer hen data from TÜİK (Turkish Statistical Institute) for the 31 districts of Konya Province, direct N_2O emissions from manure management were calculated with the Tier 1a method, assuming production in high-productivity cage systems and using data for "Poultry manure with litter." The analysis of direct N_2O emissions across 31 districts in Konya Province calculated an annual emission of 1,234.43 kg N_2O from operations housing 7,253,446 layer hens. Using the IPCC's 100-year global warming potential coefficient (GWP_{100} = 273 kg CO_2e/kg N_2O), this was converted to a total carbon equivalent of 337,000.18 kg CO_2e/year (IPCC, 2019). This result shows that although direct N_2O emissions from animal manure management occur in lower volumes compared to other greenhouse gases like methane, they represent a significant share in terms of carbon equivalent due to their high GWP value. The

district-based emission distribution is concentrated in Karatay (79,241.51 kg CO_2e; 23.5%), Meram (71,386.87 kg CO_2e; 21.2%), and Kulu (61,137.17 kg CO_2e; 18.1%). These three central districts alone account for approximately 62.8% of the total emissions, while Sarayönü (7.0%) and Selçuklu (9.5%) are also among the top five emission sources, contributing to 79.3% of the total. The individual shares of the remaining districts generally remain below 1%, indicating that the carbon load from N_2O is limited in small-capacity enterprises Table 3. The annual CO_2 equivalent per hen from direct N_2O was calculated to be approximately 0.046 kg CO_2e/hen*year. This low value highlights that direct N_2O emissions per animal unit are relatively small, but the total amount can increase rapidly with the scale of production. Therefore, promoting advanced manure management techniques such as covered storage or daily scraper systems, especially in high-density production centers like Karatay, Meram, and Kulu, could significantly reduce direct N_2O emissions. In conclusion, direct N_2O emissions from manure in Konya Province are directly related to the number of animals, the manure management system, and enterprise capacity. These data provide guidance for developing regional greenhouse gas reduction strategies, particularly in improving nitrogen management and manure application techniques in districts with large-scale production.

Indirect N_2O Emissions from Manure Management

Indirect nitrous oxide (N_2O) emissions from manure management systems, specifically N_2O from volatilization, and their carbon dioxide equivalent (CO_2e) effects were analyzed for layer hen enterprises in Konya's 31 districts based on 2024 data (Tablo 4). The analysis for the 31 districts in Konya Province revealed annual emissions of 5,925.28 kg N_2O from volatilization, resulting in a carbon equivalent of 1,617,600.86 kg CO_2e/year, calculated using the IPCC GWP_{100} factor of 273 kg CO_2e/kg N_2O (IPCC, 2019). This shows that indirect N_2O constitutes a significant share of the total carbon equivalent from manure management, indicating that nitrogen losses through volatilization are a critical factor. The emission distribution is concentrated in Karatay (380,359.26 kg CO_2e; 23.5%), Meram (342,656.95 kg CO_2e; 21.2%), and Kulu (293,458.42 kg CO_2e; 18.1%). These three high-density production regions alone account for approximately 62.8% of the total indirect N_2O carbon equivalent. The average indirect N_2O carbon footprint per hen was calculated to be approximately 0.22 kg CO_2e/hen*year. For N_2O emissions from leaching, the fraction lost by leaching (Frac_leach) was determined to be zero based on IPCC 2019 guidelines, as the nitrogen is lost in the form of NH_3 and NO_x gases through volatilization. Therefore, the calculation for indirect N_2O emissions from leaching was not performed.

Table 4. Emission values of N_2O from volatilization from manure management (kg/year), calculated CO_2 amounts (kg CO_2/year), and carbon footprint values (kg/hen*year) for layer hen enterprises in the 31 districts of Konya Province.

Total Emissions and Comparative Discussion

When the total greenhouse gas emissions from layer hen enterprises in Konya in 2024 are examined, the highest contribution comes from methane (CH_4) gas, as shown in Figure 2. Approximately 94,348 kg of CH_4 was emitted from these operations annually. Additionally, 1,234 kg of direct N_2O and 5,925 kg of N_2O from volatilization were calculated from manure management. Thus, the total greenhouse gas emission from layer hen farming in Konya reached approximately 101,508 kg/year. These results highlight the dominant effect of methane gas, while also showing that nitrous oxide emissions have a non-negligible environmental impact.

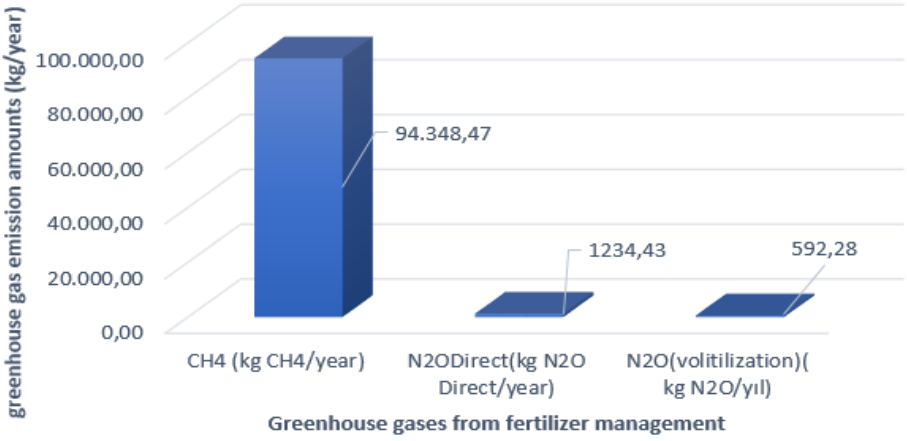

Figure 2. Emission values of CH_4, N_2O_{direct} and $N_2O_{volatilization}$ gases originating from manure management of laying hen farms for 31 districts of Konya Province in 2024 (kg/year)

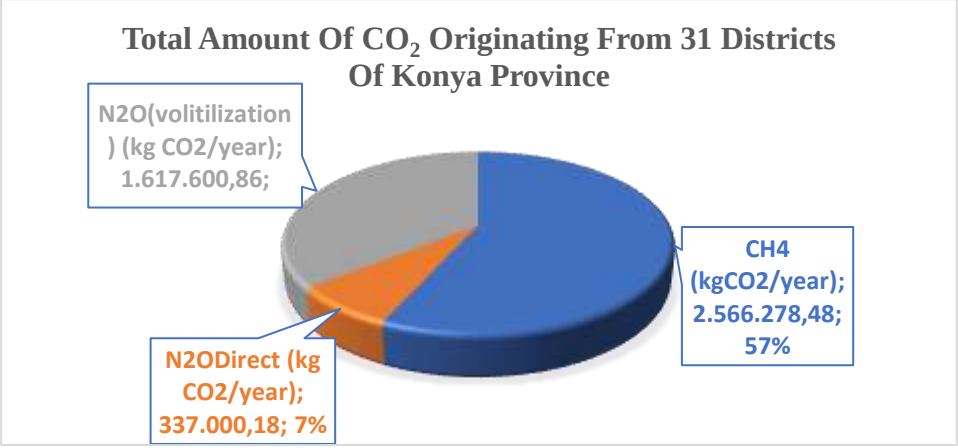

Figure 3. CO_2 amounts resulting from the release of CH_4 N_2O_{direct} and $N_2O_{volatilization}$ gases in laying hen farms for 31 districts of Konya Province in 2024, (kg).

Fabbri et al. (2007), monitoring annual NH_3, CH_4, and N_2O emissions in Italian farms with a capacity of about 60,000 hens, showed that the methane load was lower in belt systems. The high methane share in Konya confirms the necessity of appropriate manure management technologies (biogas, covered storage). Compared to the value of 1.6 kg CO_2e/kg egg calculated by Taylor et al. (2014) for mixed farms, the annual average of 0.62 kg CO_2e/hen in Konya indicates the effects of a similar or slightly higher intensity system.

Dunkley et al. (2015) reported total GHG emissions in the range of 917–1,757.8 tons CO_2e/year for four different operations, and Pishgar-Komleh et al. (2017) reported a value of 19.13 tons

CO_2e per 1000 broilers in Iran, which is consistent in magnitude with the 4,520 tons CO_2e calculated for 7.25 million hens in Konya. Fabbri et al. (2007) and other studies (Ahmet, 2019; Yaylı, 2019) provide context, with Konya's high absolute emissions highlighting the differences arising from the scale of the system. Compared to Yaylı's (2019) findings of 2.2–5.1 kg CO_2e/functional unit in broiler operations, this study emphasizes the potential for Konya's poultry sector to reduce its emission intensity by improving manure management technologies.

Recommendations

In conclusion, the calculations based on the cage system model in Konya's layer hen enterprises show that emission levels reach significant magnitudes, especially in districts with large-capacity operations. Parameters such as intensive production density, manure management practices, climatic conditions, and shelter ventilation are key factors explaining the differences in greenhouse gas emissions between districts. Emissions are closely related not only to animal numbers but also to the manner of manure management, litter use, system type (closed-open), storage duration, and local climatic conditions. Promoting biogas systems, converting manure storage to closed systems, and encouraging alternative management techniques like composting in high-emission districts will be effective in reducing the total greenhouse gas load. Developing sustainable manure management policies tailored to local conditions for Konya's layer hen enterprises will significantly contribute to reducing environmental impact.

Overall, it is understood that CH_4 emissions from the layer hen population in Konya are high in quantity, while N_2O emissions also contribute significantly, particularly through volatilization mechanisms. This situation reveals the importance of manure management and emission reduction strategies in the region's poultry activities and demonstrates that both direct and indirect greenhouse gas emissions must be controlled with an integrated approach.

ÖZET

Beslenme durumu değerlendirmesi, bireylerin sağlığının korunması, hastalıkların önlenmesi ve tedavi sürecinin etkin yönetimi açısından kritik bir süreçtir. Bu değerlendirme; antropometrik ölçümler, biyokimyasal göstergeler, klinik bulgular ve diyet öyküsünü kapsayan bütüncül bir yaklaşımla yapılmaktadır. Son yıllarda vücut kompozisyonunun ayrıntılı olarak belirlenmesine olanak sağlayan BİA, pratik, noninvaziv ve düşük maliyetli oluşu nedeniyle beslenme biliminde yaygın olarak kullanılmaktadır. Bu derlemenin amacı, beslenme durumunun değerlendirilmesinde kullanılan biyolojik empedans analizi (BİA) ve özellikle faz açısı (phase angle, PhA) parametresinin klinik ve sağlıklı popülasyonlarda kullanımını, belirleyicilerini ve prognostik değerini incelemektir. BİA ile hesaplanan faz açısı (PhA), hücre zarının kapasitif özelliklerini ve vücut sıvılarının dağılımını yansıtan, direnç (resistance) ve reaktans (reactance) değerlerinden türetilmiş bir parametredir. PhA, hücresel bütünlük ve vücut hücre kütlesinin dolaylı bir göstergesi olarak kabul edilmektedir. Düşük faz açısı değerleri genellikle hücre bütünlüğünün bozulduğunu, inflamasyon, malnütrisyon veya kronik hastalıkların varlığını işaret ederken; yüksek faz açısı değerleri sağlıklı hücresel yapı ve optimal beslenme durumuyla ilişkilendirilmiştir. Güncel literatür, PhA'nın yalnızca sağlıklı bireylerde değil; kanser, kronik böbrek hastalığı, HIV enfeksiyonu, yaşlılık ve yoğun bakımda izlenen hastalar gibi klinik popülasyonlarda da önemli bir prognostik biyobelirteç olduğunu ortaya koymaktadır. Düşük PhA, mortalite ve morbidite riskinin artışı ile, yüksek PhA ise daha iyi prognoz ve yaşam kalitesi ile ilişkilendirilmiştir. PhA'nın yorumlanmasında yaş, cinsiyet, etnik köken ve mevcut sağlık durumu gibi faktörler etkili olup, farklı popülasyonlar için standardizasyon ihtiyacı bulunmaktadır. Sonuç olarak, faz açısı beslenme durumunun objektif ve hassas bir göstergesi olarak hem araştırmalarda hem de klinik pratikte giderek önem kazanmaktadır. Ancak rutin klinik kullanımı için referans değerlerin netleştirilmesi, farklı popülasyonlar için kesme noktalarının belirlenmesi ve ölçüm koşullarında standardizasyonun sağlanması gerekmektedir.

Anahtar Kelimeler: Antropometrik ölçümler, Beslenme, Faz açısı

THE ROLE OF PHASE ANGLE IN NUTRITIONAL STATUS ASSESSMENT

ABSTRACT

Nutritional status assessment is a critical process for protecting individual health, preventing disease, and effectively managing treatment process. This assessment is conducted with a holistic approach encompassing anthropometric measurements, biochemical indicators, clinical findings, and dietary history. In recent years, BIA, which allows for detailed determination of body composition, has been widely used in nutritional sciences due to its practical, noninvasive, and low-cost nature. The aim of this review is to examine the use, determinants, and prognostic value of biological impedance analysis (BIA), and particularly phase angle (PhA) parameter, used in assessment of nutritional status in clinical and healthy populations. The phase angle (PhA) calculated by BIA is a parameter derived from resistance and reactance values, reflecting capacitive properties of the cell membrane and the distribution of body fluids. PhA is considered an indirect indicator of cellular integrity and body cell mass. While low phase angle values generally indicate impaired cell integrity, presence of inflammation, malnutrition, or chronic diseases; High phase angle values have been associated with healthy cellular structure and optimal nutritional status. Current literature demonstrates that PhA is an important prognostic biomarker not only in healthy individuals but also in clinical populations such as cancer, chronic kidney disease, HIV infection, aging, and patients in intensive care. Low PhA has been associated with an increased risk of mortality and morbidity, while high PhA has been associated with a better prognosis and quality of life. Factors such as age, gender, ethnicity, and current health status influence interpretation of PhA, necessitating standardization for different populations. Consequently, phase angle is gaining increasing importance as an objective and sensitive indicator of nutritional status in both research and clinical practice. However, for routine clinical use, reference values need to be clarified, cutoff points for different populations, and standardization of measurement conditions is necessary.

Keywords: Anthropometric measurements, Nutrition, Phase angle

Giriş

Beslenme durumu değerlendirmesi, bireylerin sağlığının korunması, hastalıkların önlenmesi ve tedavi sürecinin etkin bir şekilde yönetilmesi açısından kritik bir öneme sahiptir. Bu değerlendirme; antropometrik ölçümler, biyokimyasal parametreler, klinik bulgular ve diyet öyküsünü içeren çok boyutlu bir yaklaşımla gerçekleştirilir. Son yıllarda ise vücut kompozisyonunun daha ayrıntılı analizine olanak tanıyan biyolojik empedans analizi (BIA) yöntemleri, beslenme değerlendirmelerinde daha sık kullanılmaya başlanmıştır. BIA yöntemiyle elde edilen faz açısı (phase angle) parametresi, hücresel bütünlük ve vücut hücre kütlesi hakkında dolaylı bilgiler sağlayarak, beslenme durumunun objektif ve hassas bir göstergesi olma potansiyeli taşımaktadır (Unterberger et al., 2023). Faz açısı, hücre zarının kapasitif özelliklerini ve vücut içindeki sıvı dağılımını yansıtan, direnç (resistance) ve reaktans (reactance) değerlerinden hesaplanan bir parametredir. Düşük faz açısı değerleri, genellikle hücresel bütünlüğün bozulduğunu, inflamasyon veya malnütrisyon gibi durumların varlığını işaret ederken; yüksek faz açısı değerleri iyi hücresel bütünlük ve optimal beslenme durumu ile ilişkilendirilmiştir. Bu nedenle faz açısı hem sağlıklı bireylerde hem de hastalıklara sahip popülasyonlarda beslenme durumu takibinde önemli bir biyobelirteç olarak kabul edilmektedir (Rosa et al., 2025). Yapılan güncel çalışmalar, faz açısının özellikle kanser, kronik böbrek hastalığı, HIV, yaşlılık ve yoğun bakım gibi klinik durumlarda prognoz göstergesi olabileceğini ortaya koymakta ve bu parametrenin rutin beslenme değerlendirme süreçlerine entegrasyonunun faydalarını vurgulamaktadır. Ancak faz açısının klinik yorumlaması, bireyin yaşı, cinsiyeti ve hastalık durumuna göre farklılık gösterebileceğinden, standardizasyon ihtiyacı da dikkate alınmalıdır (Dolan et al., 2020; Rosa et al., 2025).

Beslenme Durumunun Değerlendirilmesi

Beslenme durumunu değerlendirirken, tek bir ideal testin bulunmadığını bilmek önemlidir. Bu nedenle, bilgiler sistemli bir şekilde toplanmalı ve elde edilen tüm veriler doğrultusunda genel bir değerlendirme yapılmalıdır. Amerikan Parenteral ve Enteral Beslenme Derneği (ASPEN) rehberlerine göre, kapsamlı bir beslenme değerlendirmesi; ayrıntılı tıbbi öykü ve fizik muayeneyi, antropometrik ölçümleri, tanısal testleri ve diyet analizlerini içermelidir (Mueller ve ark.,2011).

Antropometrik Ölçümler

Bireylerin beslenme durumları; zayıf, normal ya da kilolu olup olmadıklarının belirlenmesi yoluyla da değerlendirilebilmektedir. Bu amaçla, farklı değerlendirme yöntemleri geliştirilmiştir (Aslan ve ark, 2003). Antropometri, insan vücudunun ölçümüne yönelik bir bilim dalı olarak tanımlanır. Boy uzunluğu, bireyin ayakta dururken sahip olduğu yüksekliği ifade etmek için kullanılır. Vücut kompozisyonunun belirlenebilmesi için bireyin vücut ağırlığının ölçülmesi gereklidir. Bu ölçümde ağırlık birimi olarak kilogram (kg) kullanılmaktadır (Beam ve Adams, 2013). Antropometrik ölçümler, vücuttaki protein ve yağ depolarını yansıttıkları için beslenme durumunun belirlenmesinde önemli bir yer tutar (Baysal ve ark, 2013).

Antropometrik değerlendirmelerde en sık başvurulan yöntemler şu şekilde sınıflandırılabilir:

- Vücut ağırlığı ve boy uzunluğu ölçümleri
- Beden Kütle İndeksi (BKİ) hesaplaması
- Bel ve kalça çevresi ölçümleri ile bel/kalça oranı
- Vücut bileşimi analizleri (Baysal ve ark, 2013).

Vücut Bileşimi

Boy, ağırlık, beden kütle indeksi (BKİ), bel-kalça çevresi ve bel/kalça oranı gibi ölçümler beslenme durumunun değerlendirilmesinde önemli göstergelerdir. Ancak bu ölçümler, vücuttaki kas ve yağ gibi bileşenleri birbirinden ayırt edemezler. Bu nedenle, bu temel ölçümlere ek olarak vücut bileşimi analizlerinin de yapılması gereklidir. Vücut bileşimi analizi; toplam vücut ağırlığının, yağ kütlesi ve yağsız vücut kütlesi şeklinde iki ana bileşene ayrılmasını sağlar. Daha detaylı analizlerde ise bu bileşenlere ek olarak toplam vücut suyu miktarı da değerlendirilebilmektedir (Kayan, 2012). Vücut kompozisyonunu ölçmeye yönelik çalışmalar, 1940'lı yıllarda A.R. Behnke'nin öncülüğünde başlamıştır (Sarıtaş ve ark, 2011). Vücut kompozisyonu; yaş, cinsiyet, kas kütlesi, fiziksel aktivite düzeyi, mevcut hastalıklar ve bireyin beslenme durumu gibi çeşitli faktörlere bağlı olarak değişiklik gösterebilir (Tepe 2014). Vücut kompozisyonunu belirlemek amacıyla yöntem seçilirken; ekipman ve personel maliyeti, ölçüm süresi, radyasyona maruz kalma durumu ile elde edilen verilerin doğruluk düzeyi gibi faktörler göz önünde bulundurulmalıdır (Andreoli vd 2016). Vücut kompozisyonu ölçüm yöntemleri; doğrudan (direkt), dolaylı (indirekt) ve çift dolaylı (çift indirekt) yöntemler olmak üzere üç grupta sınıflandırılmaktadır. Direkt yöntemler, vücudun kimyasal yapısını doğrudan analiz ederek ölçüm yapan tekniklerdir. İndirekt yöntemler ise, nekropsi çalışmalarından elde edilen verilerin çeşitli formüller aracılığıyla değerlendirilmesine dayanır. Çift indirekt yöntemler ise, bir indirekt yöntemin sağladığı veriler ile belirli bir parametre arasındaki istatistiksel ilişkiler temel alınarak geliştirilmiştir. Bu yöntemler arasında antropometrik ölçümler, biyoelektrik impedans analizi ve deri kıvrım kalınlığı ölçümleri yer almaktadır (Victor, 2012). Ancak, vücut kompozisyonunu belirlemede kullanılan referans yöntemler genellikle zaman alıcı, uygulaması güç ve yüksek maliyetlidir. Bu nedenle, daha pratik ve erişilebilir bir alternatif olarak biyoelektrik impedans analizi (BİA) yaygın şekilde tercih edilmektedir (Canbolat, 2018).

Tablo 1. Vücut Kompozisyonu Değerlendirmede Kullanılan Yöntemlerin Kısıtlılıkları ve Avantajları (Tepe, 2014)

Biyoelektrik Empedans Analizi (BİA)

Klinik uygulamalarda, beslenme alışkanlıklarının değerlendirilmesinin yanı sıra vücut kompozisyonunun analiz edilmesi de büyük önem taşımaktadır. Bu amaçla, genellikle noninvaziv, uygulanması kolay ve düşük maliyetli bir yöntem olan biyoelektrik impedans analizi (BİA) tercih edilmektedir (Barrea ve ark., 2021). Biyoelektrik impedans analizi (BİA), ellere ve ayaklara yerleştirilen dört elektrot aracılığıyla, faz duyarlılığı bulunan bir impedans cihazı kullanılarak gerçekleştirilir. Bu yöntemde, vücuda ağrısız, sabit ve düşük seviyeli 50 kHz frekansında, 800 µA'lik bir elektrik akımı uygulanır. Farklı vücut dokularının bu akıma gösterdiği direnç (empedans) farklılıklarına dayanarak vücut bileşenleri hakkında bilgi elde edilir (Lukaski, Kyle ve Kondrup, 2017).

Biyoelektrik impedans analizi (BİA) cihazı aracılığıyla aşağıdaki parametreler belirlenebilmektedir:

1. Vücut yağ yüzdesi ve yağ kütlesi,
2. Yağsız doku oranı ve kütlesi,
3. Toplam vücut ağırlığının bileşenlerine göre dağılımı (yüzde olarak),
4. Vücut sıvı miktarı (toplam vücut suyu),
5. Tahmini bazal metabolizma hızı,
6. Tahmini ortalama günlük enerji gereksinimi,
7. Beden kütle indeksi (BKİ),
8. Elektrik akımının geçişine karşı oluşan direnç (impedans) (Özçetin ve ark., 2017).

Ayrıca BİA, bireysel sıvı dağılımını ve tüm vücuttaki hücre zarı bütünlüğünü değerlendirerek, hücre ölümü ve hücresel hasarla ilişkili inflamatuar biyobelirteçleri dolaylı olarak tanımlamada kullanılan basit ve bilimsel olarak doğrulanmış bir yöntemdir (Lukaski ve ark., 2017)

BİA Ölçümü Öncesi Dikkat Edilmesi Gereken Durumlar

1. Ortam Sıcaklığı: Ölçümün yapıldığı oda serin (~14°C) olmamalıdır. Düşük ortam sıcaklığı, deri ısısında azalmaya ve buna bağlı olarak toplam vücut direncinde artış ile yağsız vücut kütlesinde azalmaya neden olabilir.
2. Açlık Durumu: Ölçüm öncesinde en az 4 saatlik bir açlık süresi gereklidir.
3. Fiziksel Aktivite: Ölçümden 24–48 saat önce ağır fiziksel egzersiz yapılmamalıdır.
4. Alkol Tüketimi: Testten en az 24 saat önce alkol alınmamalıdır.
5. Sıvı Tüketimi: Ölçüm öncesinde aşırı miktarda su içilmemelidir.
6. İdrar Boşaltımı: Testten yaklaşık 30 dakika önce mesane boşaltılmalıdır.
7. Kafein Tüketimi: Ölçümden en az dört saat önce çay, kahve, kola gibi kafein içeren içeceklerin tüketiminden kaçınılmalıdır.
8. Menstruasyon Dönemi: Kadın bireylerde adet dönemi sırasında ölçüm yapılmamalıdır, çünkü bu dönemde sıvı dengesinde değişiklik olabilir.
9. Metal Takılar: Ölçüm sırasında kişinin üzerinde metal takı, kemer, saat gibi iletken materyaller bulunmamalıdır.
10. Kalp Pili: Ölçüm yapılacak bireyde kalp pili bulunmamalıdır (Nalçacıoğlu,2014).

BİA'nın Bileşenleri

Biyoelektrik impedans analizinde (BİA), alternatif akıma karşı gösterilen direnç olan empedans (Z), vücuttaki su ve elektrolit içeriği ile bunların dağılımına bağlı olarak vücut kompozisyonunu yansıtmaktadır (Kyle ve ark., 2004). Biyoelektrik impedans analizi, vücut kompozisyonunu belirlerken elektriksel reaktans ve rezistans değerlerinden yararlanmaktadır (Bosy-Westphal ve ark., 2006). Empedans (Z), rezistans (R) ve reaktans (Xc) olmak üzere iki temel bileşenden oluşmaktadır. Rezistans, elektrik akımının geçişine karşı hücre içi ve dışı sıvıların gösterdiği toplam direnci ifade eder; bu direnç özellikle hücre dışı sıvı miktarına bağlıdır. Reaktans ise, elektrik yükünü alternatif biçimde depolayan ve akımın geçişini geciktirerek bu yükün serbest kalmasını sağlayan hücre membranlarının kapasitif özelliklerinden kaynaklanır. Bu durum, hücre membranlarının oluşturduğu direnç olarak tanımlanabilir ve büyük ölçüde vücut hücre kütlesine dayanır (Kyle ve ark., 2004). Rezistans (R), vücuttaki su içeriğiyle ters orantılıdır. Bu nedenle, vücutta ödem gibi durumlarda ya da aşırı sıvı alımının ardından, su miktarındaki artışa bağlı olarak R değeri düşer. Buna karşılık, dehidrasyon gibi su kaybı yaşandığında ise R değeri yükselir. Başka bir deyişle, vücutta sıvı fazlalığı olduğunda elektrik iletkenliği artar ve direnç azalır; sıvı azaldığında ise iletkenlik düşer ve direnç yükselir. Bu bağlamda, yüksek rezistans değeri bireyin dehidrate olduğunu, düşük rezistans değeri ise ödem varlığına işaret etmektedir (Harrisville, 2009). Reaktans (Xc), vücut hücre kütlesiyle doğru orantılıdır. Bu nedenle, birey sağlıklı ve yeterli beslendiğinde hücre zarlarının bütünlüğü korunur ve hücrelerin elektriksel yükü tutma kapasitesi artar; bu durum reaktans değerinin yüksek olmasına yol açar. Buna karşılık, hücresel yapıların bozulduğu, yetersiz beslenme veya ileri düzey kilo kaybı gibi durumlarda hücre sayısı ve zar bütünlüğü azaldığı için Xc değeri düşer. Reaktansın yüksek olması, genellikle bireyin beslenme durumunun iyi olduğunu; düşük olması ise yetersiz beslenmeyi ve potansiyel hücresel hasarı işaret eder. Xc değerinin zamanla sabit kalması ise, kişinin metabolik durumunun ve beslenme dengesinin istikrarlı olduğunu gösterebilir (Harrisville, 2009). Klinik uygulamalarda en iyi tanımlanmış impedans parametresi faz açısıdır. Çeşitli hastalıklarda klinik sonuçları ve mortaliteyi yüksek oranda öngördüğü gösterildiğinden, bu parametre son yıllarda giderek daha fazla önem kazanmıştır. Empedans matematiksel olarak $Z^2=R^2 + Xc^2$ denklemi ile tanımlanır (Norman ve ark., 2012). Biyoelektrik impedans analizi, vücut kompozisyonunu reaktans ve rezistans ölçümleri aracılığıyla değerlendirir. Rezistans ile reaktans arasındaki ilişki sonucu ortaya çıkan faz açısı, hücre kompozisyonu, sıvı volümü ve hücre membran potansiyeline bağlı olarak değişmekte olup; yaş, cinsiyet gibi bireysel faktörlerden de etkilenmektedir (Bosy-Westphal ve ark., 2006). Düşük faz açısı, genellikle düşük reaktans ve yüksek rezistans ile birlikte görülür ve bu durum hücre zarı bütünlüğünde azalmayı göstermektedir. Buna karşın, yüksek faz açısı değerleri, yüksek reaktans ve düşük rezistans ile karakterize olup, daha fazla sağlam hücre zarı varlığını işaret eder (Selberg & Selberg, 2002).

Faz Açısı

Faz açısı (PhA), biyoelektrik impedans analizinde önemli bir parametre olup, hücresel sağlığın göstergesi olarak kabul edilmektedir. Ayrıca, yapılan çalışmalar faz açısının kötü prognoz, yetersiz beslenme, fonksiyon kaybı ve mortalite ile ilişkili olduğunu ortaya koymaktadır. Bunun yanı sıra, faz açısının oksidatif stresle de bağlantılı olabileceği düşünülmektedir (da Silva, Gonzalez, Cereda ve Prado, 2021). Bunun yanı sıra, faz açısı çeşitli hastalıklarda morbidite ve mortalite göstergesi olarak da kullanılmaktadır (Norman ve ark., 2010; Stobäus ve ark., 2012).

Faz açısı (PhA), reaktansın elektrik direncine oranı olarak tanımlanır ve hücre zarı bütünlüğü ile vücut hücre kütlesine bağlıdır. Ayrıca, PhA değerleri ile vücut hücre kütlesi arasında anlamlı

bir korelasyon bulunmaktadır (Kumar ve ark., 2012). Faz açısının kullanımı, vücut sıvılarındaki değişikliklerin olduğu ya da vücut ağırlığının ölçülemediği hastalarda bile uygulanabilir olması nedeniyle önemli bir avantaj sağlamaktadır (Motta ve ark., 2015). Faz açısı, rezistans (R) ve reaktans (Xc) olmak üzere iki bileşenden oluşur. Faz açısı, Xc ile R arasındaki oranın arktanjantı alınarak hesaplanır ve aşağıdaki formülle ifade edilir (da Silva, Gonzalez, Cereda ve Prado, 2021).

Faz Açısı (PhA)(°) = arctan(Reaktans/Rezistans)* (180/π)

Çeşitli çalışmalarda, HIV enfeksiyonu, karaciğer hastalıkları, kanser, yoğun bakımda tedavi gören hastalar, cerrahi ve kemoterapi uygulanan bireyler ile yaşlılarda düşük faz açısının kötü prognozun önemli bir göstergesi olduğu rapor edilmiştir (Garlini ve ark., 2019).

Faz Açısının Değerlendirilmesi

Sağlıklı bireylerde faz açısı genellikle 6° ile 7° arasında değişirken, atletlerde bu değer 8,5°'ye kadar çıkabilmektedir. Düşük faz açısı (<5°) ise hücresel bütünlüğün kaybını işaret eder. Faz açısının hücresel bütünlükle güçlü bir ilişkiye sahip olması, onu empedansa kıyasla beslenme durumunun daha hassas bir göstergesi haline getirmektedir (Marra ve ark., 2019).

Faz Açısını Etkileyen Etmenler

Faz açısı, cinsiyet, yaş, fiziksel aktivite, beslenme durumu ve hastalık gibi çeşitli faktörlerden etkilenmektedir (Canbolat, 2018).Sağlıklı bireylerde faz açısının (PhA) başlıca belirleyicileri cinsiyet, yaş ve beden kütle indeksi (BKİ) olarak tanımlanmaktadır (Kyle ve ark., 2012; Norman ve ark., 2012). Ayrıca, sağlıklı ve hastalıklı durumlar arasında PhA değerlerinde anlamlı farklılıklar gözlenmektedir (Kyle ve ark., 2012). Malnütrisyon da dahil olmak üzere çeşitli hastalık durumlarında PhA genellikle normalin altında seyretmekte olup, kronik hastalıklarda mortalitenin prognostik göstergesi olarak kullanımı önerilmektedir (Norman ve ark., 2010).

Cinsiyet ve yaş

Geniş kapsamlı bir çalışmada, 18-94 yaş aralığında 1967 sağlıklı yetişkinin faz açıları incelenmiş ve ortalama faz açısı 6,93±1,15° olarak belirlenmiştir. Araştırma, faz açısı (PhA) değerlerinin yaş ve cinsiyete göre değişimini ortaya koymuştur. Bulgulara göre, erkeklerin faz açısı değerleri kadınlara göre daha yüksek bulunmuştur. Ayrıca, yaş ilerledikçe faz açısı değerlerinde azalma eğilimi gözlemlenmiştir. Örneğin, erkeklerde genç yaş grubunda (18-20 yaş) ortalama faz açısı 7,90° iken, yaşlı grup (≥70 yaş) için bu değer 6,19° olarak saptanmıştır. Kadınlarda ise bu değerler sırasıyla 7,04° ve 5,64° olarak rapor edilmiştir (Barbosa-Silva ve ark.,2005). Yine bu konuda yapılan geniş kapsamlı bir çalışmada, 1013 sağlıklı yetişkin bireyin faz açıları incelenmiş ve erkeklerde ortalama faz açısı 6,1±0,8°, kadınlarda ise 5,6±0,7° olarak saptanmıştır (Barrea ve ark.,2017). 2015 ile 2020 yılları arasındaki veriler kullanılarak gerçekleştirilen ve 1877 kişinin değerlendirildiği bir araştırmada, 983 obez birey (BKİ ≥30 kg/m²) ile 894 obez olmayan birey incelenmiştir. Erkek obez grubunda ortalama Faz Açısı (PhA) 6.80° iken, kontrol grubundaki erkeklerde bu değer 6.86° olarak saptanmıştır. Kadınlarda ise obez bireylerin PhA ortalaması 6.21°, obez olmayanların ise 6.16°'dir. Genel olarak erkeklerdeki PhA değerleri, kadınlara kıyasla belirgin biçimde daha yüksektir (Di Vincenzo ve ark.,2023). İlgili çalışmalar incelendiğinde, erkek bireylerin faz açısı değerlerinin kadınlara kıyasla; genç bireylerin ise yaşlı bireylere oranla daha yüksek olduğu gözlemlenmektedir. Bu durum, erkeklerin ve genç yaştaki bireylerin kadınlara ve yaşlı bireylere göre daha fazla kas kütlesine ve daha düşük yağ kütlesine sahip olmalarıyla açıklanabilir (Canbolat,2018).

Beslenme Durumu

Beslenme durumu ile faz açısı arasındaki ilişki çeşitli araştırmalarda ele alınmıştır. Yapılan çalışmalar, faz açısı ile malnütrisyon değerlendirme araçlarından Subjektif Global Değerlendirme (SGA) ve Mini Nütrisyonel Değerlendirme (MNA) arasında negatif bir korelasyon olduğunu ortaya koymuştur. Uygun beslenme uygulamaları ve malnütrisyonun tedavisiyle faz açısında artış gözlemlenebilmektedir (Ayyıldız ve ark.,2016). BKİ ile faz açısı arasındaki ilişki değerlendirildiğinde, vücutta artan vücut kütle indeksiyle birlikte yağ ve kas hücrelerinin sayısındaki artışa bağlı olarak faz açısının da yükseldiği ifade edilmektedir. Ancak bu pozitif ilişkinin genellikle BKİ'si 30 kg/m²'nin altında olan bireylerde görüldüğü; BKİ'si 40 kg/m²'yi aşan obez bireylerde ise bu ilişkinin ters yönde seyrettiği rapor edilmiştir (Bosy-Westphal ve ark.,2006). 2014–2022 yılları arasında gerçekleştirilen ve 1079 hasta ile 86 sağlıklı bireyin değerlendirildiği bir çalışmada, malnütre, obez ve sağlıklı bireyler arasındaki faz açısı (PhA) değerleri karşılaştırılmıştır. Bulgulara göre, obezite grubunda PhA 5.98°, malnütrisyon grubunda 4.79° ve sağlıklı bireylerde ise 6.08° olarak saptanmıştır. Ayrıca, faz açısının yaşla negatif yönde, vücut kütle indeksi (BKİ) ile ise pozitif yönde ilişkili olduğu belirlenmiştir (Saavedra Vásquez ve ark.,2024). Sonuç olarak, faz açısının beslenme durumu ve buna bağlı olarak vücut ağırlığından etkilendiği açıkça görülmektedir. Ancak, faz açısına ilişkin standart referans aralıklarının belirlenmemiş olması, beslenme durumunun değerlendirilmesinde kesin ve net bir yargıya varılmasını zorlaştırmaktadır (Canbolat,2018).

Fiziksel Aktivite Düzeyi

Faz açısının, toplam vücut protein miktarı, kas kütlesi ve el kavrama gücü ile ilişkili olduğu bilinmektedir (Ayyıldız ve ark.,2016). Sağlıklı bireylerde faz açısı genellikle 5° ile 7° arasında değişmekte olup, bu değer atletik bireylerde 9.5°'ye kadar çıkabilmektedir (Norman ve ark., 2012). 2021 yılında 66 katılımcı ile gerçekleştirilen bir çalışmada, spor yapan bireylerle spor yapmayanlar arasındaki faz açısı (PhA) farkları incelenmiştir. Erkek sporcularda ortalama PhA değeri 6.85 ± 0.50 iken, sedanter erkek bireylerde bu değer 6.29 ± 0.67 olarak ölçülmüştür. Kadınlarda ise sporcuların ortalama PhA değeri 5.61 ± 0.44, sedanter bireylerde ise 5.47 ± 0.58 olarak bulunmuştur. Elde edilen sonuçlara göre, sporcuların faz açısı değerleri sedanter bireylere kıyasla anlamlı düzeyde daha yüksek çıkmıştır. Ayrıca, özellikle erkek katılımcılarda PhA'nın fiziksel aktivite düzeyiyle ilişkili olduğu belirlenmiştir (Šeper ve ark., 2021). Fiziksel aktivitenin faz açısı üzerindeki olumlu etkisinin olası mekanizması şu şekilde açıklanmaktadır: Uzun süreli egzersiz sonucunda glikojen depolarındaki artış, hücre içi su (ICW) dengesinin sağlanmasına katkı sağlar. Bu durum, glikojenin her gramının yaklaşık 3 gram su ile birlikte depolanması özelliğinden kaynaklanmaktadır. ICW dengesinin korunması, kas protein sentezinin artmasına ve protein yıkımının azalmasına yol açar. Bu süreçte, kas dokusundaki artışa bağlı olarak reaktans yükselirken, artan ICW oranı nedeniyle rezistans azalır ve bu da faz açısında yükselmeye neden olur (Souza ve ark.,2017).

Faz Açısı ve Hastalıklar

Faz açısı, hücre zarının elektriksel bütünlüğünün bir göstergesi olduğundan, enflamasyon, enfeksiyon gibi membran yapısını bozan patolojik durumlardan doğrudan etkilenmektedir (Zhang ve ark., 2014). 2022 yılında yayımlanan bir çalışmada, 2014-2016 yılları arasında 427 erişkin HIV pozitif birey değerlendirilmiştir. Araştırmada, faz açısı (PhA) kesim değerleri HIV pozitif erkeklerde 5.45°, kadınlarda ise 4.95° olarak belirlenmiştir. Bu değerlerin altında kalan bireylerin, GLIM kriterlerine göre malnütrisyon riski taşıdığı tespit edilmiştir (Osuna-Padilla ve ark., 2022). 2022 yılında yayımlanan bir çalışmada, kolorektal kanser hastalarının faz açısı (PhA) değerlendirilmiştir. Toplamda 160 hasta incelenmiş ve ortalama PhA değeri yaklaşık 5.3° olarak bulunmuştur. Ayrıca, faz açısının her 1° artışında mortalite riskinin %21 oranında

azaldığı belirlenmiştir (Han ve ark., 2022). Schmidt ve arkadaşlarının yürüttüğü araştırmada, 158 meme kanseri hastasında faz açısı (PhA) değerleri değerlendirilmiştir. Çalışmanın sonuçlarına göre, katılımcıların ortalama PhA değeri yaklaşık 5.5° ± 0.8° olarak belirlenmiştir (Schmidt ve ark., 2023). Lim ve arkadaşları tarafından 2021 yılında yapılan bir araştırmada, 152 hemodiyaliz hastası değerlendirilmiştir. Erkek hastalarda ortalama faz açısı 4.62° ± 0.82 olarak ölçülmüştür. Kadın hastalarda ise bu değer biraz daha düşük olup, 3.92° ± 0.88 olarak bulunmuştur. Sonuçlar, erkek hemodiyaliz hastalarının kadınlara kıyasla daha yüksek faz açısı değerlerine sahip olduğunu göstermektedir (Lim ve ark., 2021). Chen ve arkadaşları tarafından gerçekleştirilen bir çalışmada, 101 periton diyalizi hastası değerlendirilmiştir. Araştırmada hastaların faz açısı (PhA) değerleri ölçülmüştür. Elde edilen bulgulara göre, ortalama faz açısı 5.4° olarak belirlenmiştir (Chen ve ark.,2022). Koçak ve arkadaşları tarafından 2024 yılında yayımlanan bir araştırmada, 60 yaş ve üzeri toplam 135 geriatrik hasta incelenmiştir. Çalışmada katılımcıların faz açısı (PhA) değerleri ölçülmüş ve ortalama faz açısı 5.4° olarak tespit edilmiştir (Koçak ve ark.,20224). Saueressig ve arkadaşları tarafından yürütülen bir çalışmada, 97 siroz hastasının faz açısı (PhA) değerleri incelenmiştir. Araştırma sonuçlarına göre, tüm katılımcıların ortalama faz açısı 5.4° ± 1.0° olarak belirlenmiştir. Ayrıca yapılan detaylı analizler neticesinde, sirozlu hastalar için malnütrisyon riskini belirlemede kullanılabilecek faz açısı kesim değeri ≤ 5.52° olarak saptanmıştır (Sauerressig ve ark.,2020). İncelenen çalışmalar göz önüne alındığında, hastalık durumunun faz açısını negatif yönde etkilediği söylenebilir (Canbolat,2018). Çalışmalarda faz açısı kesim değerlerinin farklılık gösterdiği görülse de, Norman ve arkadaşlarının belirlediği bazı hastalıklara ait kesim noktaları Tablo 2'de sunulmuştur. Bu kesim noktalarının altında kalan faz açısı değerleri, hastalık riskinin artmasıyla ilişkilendirilmektedir (Norman ve ark.;2012).

Tablo 2. Bazı hastalıklara ait faz açısı kesişim değerleri

Hastalık	**Faz Açısı**
HIV	5,3°-5,6°
Akciğer Kanseri	4,5°
Kolerektal Kanser	5,57°
Pankreas Kanseri	5,08°
Meme Kanseri	5,6°
Hemodiyaliz	3,0°-6,0°
Periton Diyalizi	6,0°
Karaciğer Sirozu	5,4°
Amyotrophic Lateral Skleroz	2,5°
Geriatrik Hastalar	3,5°
Sistemik Skleroz	3,9°
* (HIV):İnsan İmmün Yetmezlik Sendromu	

Sonuç ve Öneriler

BİA ölçümlerinde sıkça tercih edilen parametrelerden biri faz açısıdır. Faz açısının en büyük avantajlarından biri, vücut sıvılarındaki değişikliklerin olduğu ya da vücut ağırlığının

ölçülemediği hastalarda bile rahatlıkla kullanılabilmesidir. Faz açısı, diğer BİA parametrelerine kıyasla daha yeni bir kavramdır ve hücresel sağlık ile hidrasyon durumunu yansıtabilme özelliği taşır. Malnütrisyonun tespitinde yenilikçi bir yöntem olarak öne çıkmasının yanı sıra, henüz standart bir referans değerinin bulunmaması bu alana olan ilgiyi artırmıştır. Faz açısı ile ilgili güncel akademik çalışma sayısı uluslararası literatürde olduğu gibi ülkemizde de giderek artmaktadır. Ancak çalışmalar genel olarak hastalıklar üzerine yapılmakta olup gebe, çocuk gibi farklı popülasyonlar üzerine yapılan çalışma sayısı oldukça azdır. Ayrıca faz açısı alanında birçok çalışma yapılmış olsa da henüz farklı popülasyonlardaki bireylerde referans faz açısı değerleri belirlenememiştir. Buna sebep olarak faz açısının yaş, cinsiyet, hastalık gibi birçok faktörden etkilenmesi gösterilebilir. Sonuç olarak faz açısı hücresel sağlığı değerlendirmek adına kullanılabilecek kolay ulaşılabilir bir parametre olsa da klinik olarak kullanılıp yaygınlaşması için daha geniş örneklem büyüklüğüne sahip, farklı popülasyonları da ele alan daha fazla çalışmaya ihtiyaç vardır.

ÖZET

İrritabl Bağırsak Sendromu (İBS), dünya genelinde milyonlarca bireyi etkileyen ve en sık karşılaşılan fonksiyonel gastrointestinal bozukluklardan biri olup, toplum sağlığı açısından önemli bir sorun teşkil etmektedir. Kronik ve tekrarlayıcı karın ağrısı, şişkinlik, dışkılama alışkanlıklarında değişiklik, kabızlık, ishal veya bu semptomların dönüşümlü olarak görülmesi ile karakterize olan bu sendrom, bireylerin yaşam kalitesini belirgin şekilde azaltmakta, iş gücü kaybına ve sağlık hizmetleri kullanımında artışa yol açarak sağlık sistemine ciddi ekonomik yük getirmektedir. İBS'nin etiyolojisi karmaşık ve multifaktöriyel olup, tek bir nedene indirgenememektedir. Bu derlemenin amacı, İBS'nin tanı kriterleri, sınıflandırılması ve patofizyolojik mekanizmalarına ilişkin güncel bilgileri literatür ışığında ele almak; hastalığın ortaya çıkışında rol oynayan beslenme ve yaşam tarzı faktörlerini tartışmak; özellikle son dönemde öne çıkan düşük fermente olabilen oligosakkaritler, disakkaritler, monosakkaritler ve polioller (FODMAP) diyetinin etkinliğini, uygulanabilirliğini ve sınırlılıklarını değerlendirmektir. Bu kapsamda, klinisyenler ve diyetisyenler için İBS semptomlarının yönetiminde kullanılabilecek kanıta dayalı yaklaşımlar ortaya konulmaya çalışılmıştır. Son yıllarda düşük FODMAP diyeti, İBS semptomlarının kontrolünde en çok ilgi gören beslenme stratejilerinden biri haline gelmiştir. Diyet, FODMAP sınırlanmasına dayanmakta ve bu bileşenlerin bağırsakta hızla fermente olarak gaz üretimine, osmotik yük artışına ve buna bağlı olarak şişkinlik, karın ağrısı ve dışkılama düzensizliklerine yol açtığı bilinmektedir. Randomize kontrollü klinik çalışmaların sonuçları, düşük FODMAP diyetinin İBS'li bireylerin %50–75'inde semptomlarda anlamlı düzeyde iyileşme sağladığını göstermektedir. Bununla birlikte, uzun süreli ve katı uygulamaların bağırsak mikrobiyotasında çeşitlilik kaybına yol açabileceği, besin ögesi yetersizlikleri riski oluşturabileceği ve diyete uyumun zamanla zorlaşabileceği

bildirilmektedir. Bu nedenle, düşük FODMAP diyetinin mutlaka kişiselleştirilmiş bir beslenme planı çerçevesinde ve uzman bir diyetisyen rehberliğinde uygulanması önerilmektedir. Sonuç olarak, İBS multifaktöriyel yapısı nedeniyle bireyselleştirilmiş tanı ve tedavi yaklaşımlarını gerektiren bir hastalıktır. Özellikle düşük FODMAP diyeti, kanıta dayalı bulgularla desteklenen etkili bir yöntem olmakla birlikte, sınırlılıkları da göz önünde bulundurulmalı ve uzun vadeli yönetimde dengeleyici stratejiler uygulanmalıdır.

Anahtar Kelimeler: Beslenme, FODMAP Diyeti, İrritabl Bağırsak Sendromu

IRRITABLE BOWEL SYNDROME AND NUTRITION: EVIDENCE-BASED APPROACHES FROM DIAGNOSIS TO TREATMENT

ABSTRACT

Irritable Bowel Syndrome (IBS) is one of the most common functional gastrointestinal disorders, affecting millions of individuals worldwide and posing a significant public health problem. The purpose of this review is to review current information on the diagnostic criteria, classification, and pathophysiological mechanisms of IBS in light of the literature; to discuss the nutritional and lifestyle factors that play a role in the disease's development; and to evaluate the effectiveness, applicability, and limitations of the recently emerging low-fermentable oligosaccharides, disaccharides, monosaccharides, and polyols (FODMAP) diet. In this context, we aimed to present evidence-based approaches that can be used by clinicians and dietitians in the management of IBS symptoms. In recent years, the low-FODMAP diet has become one of the most popular nutritional strategies for managing IBS symptoms. The diet is based on restricting FODMAPs, and it is known that these compounds rapidly ferment in the intestine, leading to gas production, increased osmotic load, and consequent bloating, abdominal pain, and defecation irregularities. Results of randomized controlled clinical trials indicate that a low-FODMAP diet provides significant symptom relief in 50–75% of individuals with IBS. However, it has been reported that long-term and strict adherence may lead to a loss of diversity in the gut microbiota, pose a risk of nutrient deficiencies, and make adherence to the diet more difficult over time. Therefore, it is recommended that a low-FODMAP diet be implemented within the framework of a personalized nutrition plan and under the guidance of a registered dietitian. In conclusion, due to its multifactorial nature, IBS is a disease that requires individualized diagnostic and therapeutic approaches. While the low-FODMAP diet, in particular, is an effective method supported by evidence-based findings, its limitations should also be considered, and compensatory strategies should be implemented in long-term management.

Keywords: Nutrition, FODMAP Diet, Irritable Bowel Syndrome

Giriş

İrritabl Bağırsak Sendromu (İBS), küresel ölçekte en yaygın görülen fonksiyonel gastrointestinal bozukluklardan biridir. Bu sendromla yaşayan bireylerde, sağlıklı popülasyona kıyasla yaşam kalitesinin belirgin şekilde azaldığı bildirilmiştir. İBS'nin kronik yapısı, toplumda sık görülmesi ve sıklıkla eşlik eden diğer sağlık sorunları, hastalığın sağlık sistemine ve topluma olan ekonomik yükünü artırmaktadır. İBS'nin altında yatan biyolojik mekanizmalar hâlâ tam olarak aydınlatılamamış olup, mevcut tedavi yaklaşımlarını destekleyen bilimsel kanıtlar tutarsızlık göstermektedir. Bu belirsizlikler, özellikle beslenme temelli yaklaşımlara olan ilgiyi son yıllarda belirgin biçimde artırmıştır (Özyürek ve Pekcan, 2023). Hastaların önemli bir kısmı, yaşadıkları semptomları tükettikleri besinlerle ilişkilendirmekte olup, beslenme alışkanlıkları bu bireylerin günlük yaşamlarını etkileyen temel unsurlardan biri olarak öne çıkmaktadır. Fermente olabilen oligosakkaritler, disakkaritler, monosakkaritler ve polioller (FODMAP) bakımından sınırlı bir diyetin, diğer beslenme yaklaşımlarına kıyasla daha etkili sonuçlar verdiği gösterilmiştir. Bu nedenle, düşük FODMAP diyeti günümüzde birçok klinisyen tarafından İBS yönetiminde ilk tercih edilen beslenme stratejisi olarak değerlendirilmektedir (Bellini vd., 2020).

İrritabl bağırsak sendromu

İBS, bağırsak ile beyin arasındaki karmaşık iletişim sürecini içeren, uzun süreli bir sağlık sorunudur ve bağırsak-beyin etkileşimi bozuklukları (DGBI) arasında en yaygın olanlardan biridir (Bertin vd., 2024). Genel popülasyonda yaygınlığı, kullanılan tanı ölçütleri ve bölgesel farklılıklara göre %3,8 ile %12 arasında değişiklik göstermektedir. Türkiye'deki kesin yaygınlık oranı bilinmemekle birlikte bazı çalışmalarda İBS'nin toplumda %19 oranında görüldüğü ve kadınlarda daha yaygın olduğu bildirilmektedir (Özyürek ve Pekcan, 2023). İBS, dışkılama süreciyle bağlantılı olarak ya da bağırsak alışkanlıklarındaki değişimle birlikte görülen, tekrarlayan karın ağrısıyla karakterizedir. Bu duruma çoğunlukla karında şişkinlik veya gerginlik gibi belirtiler eşlik eder (Ooi vd., 2019). Güncel araştırmalar, mukozal dokularda özellikle mast hücreleri ve eozinofiller gibi bağışıklık hücrelerinin birikiminin, ağrıya yol açan kimyasalların salınımını tetiklediğini göstermektedir. Bu maddelerin duyusal sinirleri uyarması, viseral hassasiyetin artmasına ve rahatsız edici belirtilerin ortaya çıkmasına katkı sağlar. Bağışıklık sisteminin bu tür bir aktivasyonu, bağırsak bariyerinde oluşan bozulmalarla iç içe geçer; ayrıca bu süreçte bağırsak mikrobiyotasındaki değişiklikler, beslenme alışkanlıkları ve psikolojik stres gibi etkenler de rol oynar (Vanuytsel vd., 2023). İBS yaşamı doğrudan tehdit etmese de, bireylerin yaşam kalitesini ciddi biçimde düşürebilir; bu durum sağlık hizmetlerine başvuru sıklığında artışa ve iş gücü verimliliğinde azalmaya yol açabilir (Cassar vd., 2020). Bu semptomların ortaya çıkmasında diyetin önemli bir rol oynayabileceği düşünülmektedir. İBS tanısı almış hastaların yaklaşık %20 ila %65'i semptomlarının gıda tüketimiyle ilişkili olduğunu bildirmektedir. Son on yılda, özellikle fermente olabilen oligosakkaritler, disakkaritler, monosakkaritler ve polioller açısından düşük içerikli diyetlerin geliştirilmesiyle birlikte İBS'nin diyetle yönetimi konusunda ilgi belirgin şekilde artmıştır. Düşük FODMAP diyetinin uygulanması, yapısal olarak karmaşık bir süreçtir ve diyetin alanda eğitimli ve deneyimli bir diyetisyen tarafından yönlendirilmesi önerilmektedir (Mehtap vd., 2019).

İrritabl Bağırsak Sendromu Tanı Kriterleri

İBS tanısı için altın standart Roma IV kriterleridir (Baykut ve Baykan, 2024). İBS tanısında kullanılan Roma IV kriterlerine göre, tanı konulabilmesi için hastada son 3 ay içinde, haftada ortalama en az bir gün karın ağrısının tekrar etmesi ve bu ağrının üç özelliğin en az ikisiyle ilişkili olması gerekir. Bu özellikler: dışkılama ile bağlantılı olması, dışkılama sıklığında bir

değişiklik olması ve dışkının görünümünde bir değişiklik bulunmasıdır. Bu semptomların tanıdan en az 6 ay önce başlamış ve son 3 ay boyunca düzenli şekilde devam etmiş olması da gerekmektedir. Roma IV kriterlerine göre İBS, dışkılama alışkanlıklarının baskın özelliğine göre dört alt tipe ayrılmaktadır: Kabızlığın baskın olduğu tip (İBS-C), ishalin baskın olduğu tip (İBS-D), kabızlık ve ishal dönemlerinin dönüşümlü olduğu karışık tip (İBS-M) ve belirtilerin bu sınıflamalardan herhangi birine uymadığı, sınıflandırılamayan tip (İBS-U) (Ooi vd., 2019).

Her ne kadar belirlenmiş tanı kriterleri mevcut olsa da İBS tanısı, günlük klinik pratikte hala önemli bir zorluk oluşturmaktadır. Fiziksel belirti ya da laboratuvar bulgularının genellikle olmaması nedeniyle tanı çoğu zaman benzer belirtilere yol açan diğer hastalıkların dışlanması yoluyla konulmaktadır. Bu nedenle, tanı süreci çoğunlukla kapsamlı bir değerlendirme ve ayırıcı tanı gerektirir (Sobolewska vd., 2020). Semptomlara dayalı Roma IV kriterlerinin kullanımı ile semptomların değerlendirilmesi, bazı laboratuvar testleri, bazı popülasyonlarda çölyak hastalığının dışlanması, fiziki muayene (rektal muayene dahil) İBS tanısını koymak için genellikle yeterli olmaktadır (Lacy vd., 2023).

İrritabl Bağırsak Sendromunun Sınıflandırılması

İBS tanısında temel belirti, tekrarlayan karın ağrısının varlığıdır. Karın ağrısı olmadan İBS tanısı konulamaz. Bu ağrının, haftada ortalama en az bir gün olacak şekilde düzenli olarak ortaya çıkması gerekmektedir. İBS alt türlerinin belirlenmesinde (İBS-C, İBS-D, İBS-M ve İBS-U) dışkı formunun değerlendirilmesi önemlidir ve bu amaçla Bristol Dışkı Formu Ölçeği kullanılır. Dışkının şekli, hangi alt tipe girildiğinin belirlenmesinde temel unsurlardan biridir (Kingsley vd., 2020).

Bristol dışkı formu ölçeğinde yedi tür dışkı tanımlanmaktadır:

• Tip 1: Fındık gibi sert topaklar

• Tip 2: Sosis şeklinde fakat topaklı

• Tip 3: Sosis gibi ama yüzeyinde çatlaklar var

• Tip 4: Sosis veya yılan gibi, pürüzsüz ve yumuşak

• Tip 5: Keskin kenarlı yumuşak lekeler (kolayca geçer)

• Tip 6: Pürüzlü kenarları olan yumuşak parçalar

• Tip 7: Sulu, katı parça yok, tamamen sıvı

İBS alt tiplerinin doğru şekilde belirlenebilmesi için hastaların 14 gün boyunca bağırsak alışkanlıklarını kaydettikleri bir günlük tutmaları gerekmektedir. Bu süreçte dışkıların değerlendirilmesinde Bristol Dışkı Formu Ölçeği kullanılır. Bu ölçeğe göre, dışkı tipleri 1 ve 2 kabızlıkla, tip 6 ve 7 ise ishalle ilişkilendirilir ve anormal olarak kabul edilir. Tip 3 ve 4 dışkılar ise normal kabul edilir (Lacy ve Patel, 2017). Bristol ölçeği, hastaların dışkı formunu daha iyi tanımlayabilmesine olanak sağlar ve bu nedenle hem klinik uygulamalarda hem de araştırmalarda yaygın olarak tercih edilmektedir. İBS alt tiplerinin sınıflandırılmasında, dışkı formunun en az %25 oranında belirli bir tipe uyması dikkate alınır. Örneğin, dışkılamalarının %25'inden fazlası tip 1 veya 2 olan bireyler İBS-C olarak sınıflandırılırken; dışkılamalarının %25'inden fazlası tip 6 veya 7 olan bireyler İBS-D olarak değerlendirilir (Lacy ve Patel, 2017).

İrritabl Bağırsak Sendromu Etiyolojisi ve Patofizyolojisi

IBS, etiyolojisi bilinmemekle birlikte çok sayıda patofizyolojik mekanizma ile karakterize çok faktörlü bir hastalıktır. İBS; mikrobiyom değişiklikleri, visseral veya merkezi aşırı duyarlılık, beyin-bağırsak etkileşimlerinin değişmesi, anormal gastrointestinal hareketlilik, psikososyal

faktörler, genetik faktörler, bozulmuş safra asidi metabolizması ve besinlere aşırı duyarlılık dahil olmak üzere heterojen ve tam olarak anlaşılmamış bir patofizyolojiye sahiptir (Özyürek ve Pekcan, 2023).

İrritabl Bağırsak Sendromu ve Tedavi Yaklaşımları

İBS tedavisi genellikle baskın semptomlara dayanmaktadır kanıtlanmış net bir tedavi yoktur. Semptomlardan sorumlu olan patofizyolojik etkenin tedavisine yönelik bir yol izlenmektedir. Son 20 yılda çeşitli hedefli tedavilerin geliştirilmesine rağmen, çoğu ilaç sınırlı etkinlik göstermektedir ve plasebo yanıt oranları yüksektir (Bertin ve ark. 2024). Birçok hasta uzun süreler boyunca ilaç almaktan kaçındığından alternatif yaklaşımlar denemektedir (Özyürek ve Pekcan, 2023). İBS hastalarının %70'inden fazlası semptomlarının besinsel kaynaklı olduğunu belirtmektedir. Bu besinler, farklı fizyolojik mekanizmalar üzerinden etki göstererek karın ağrısı, şişkinlik, gaz ve bağırsak alışkanlıklarında değişiklik gibi belirtileri tetikleyebilir. Bu nedenle İBS'nin tedavisinde diyet müdahalelerine olan ilgi artmaktadır. Bu yüzden bireyler ilaçlara başvurmak yerine çeşitli diyetleri (glutensiz diyetler, düşük laktozlu diyetler, fruktozsuz diyetler ve IgG antikor testine dayalı eliminasyon diyetleri) tercih etmektedir ancak bu diyetlere ilişkin çalışmalardan elde edilen destekleyici veriler sınırlıdır (Bertin vd., 2024). FODMAP olarak adlandırılan fermente edilebilir kısa zincirli karbonhidratlar, bağırsaklarda ozmotik yük oluşturur ve bakteriyel fermantasyon süreciyle birlikte şişkinlik, gaz oluşumu ve visseral duyarlılığın artmasına neden olabilir. Yağ içeriği yüksek besinler, mide boşalmasını yavaşlatır ve kolesistokinin salınımını uyararak mide bulantısı ve hazımsızlık hissini artırabilir. Kafein ve alkol, mide asidi salgısını artırarak bağırsak bariyerinde bozulmalara yol açabilir ve böylece bağırsak geçirgenliğini artırabilir. Baharatlı gıdalar, özellikle TRPV1 adı verilen ağrı reseptörlerini uyararak karın ağrısının şiddetini artırabilir. Yapay tatlandırıcılar ise bağırsak mikrobiyotasında değişikliklere neden olarak ishal gibi sindirim problemlerine zemin hazırlayabilir. Histamin yönünden zengin gıdalar da mast hücrelerini aktive ederek inflamasyonu tetikleyebilir ve bu da İBS semptomlarının kötüleşmesine katkı sağlayabilir (Kasti vd., 2025). Klinik kılavuzlar, İBS yönetiminde ağırlıklı olarak iki temel beslenme yaklaşımına odaklanmaktadır. İlk basamak diyet tedavisi, İngiliz Diyetisyenler Derneği ile Ulusal Sağlık ve Bakım Mükemmelliği Enstitüsü (NICE) tarafından önerilen geleneksel İBS diyetidir. Bu yaklaşım; yaşam tarzı değişiklikleri, düzenli öğün tüketimi, fiziksel aktivitenin artırılması, yağ oranı yüksek besinlerin azaltılması, büyük porsiyonlardan kaçınılması, çözünmeyen lifin sınırlandırılması ve bazı yaygın besin tetikleyicilerinin diyetten çıkarılmasını içermektedir. Eğer bireyler bu standart önerilere ya da ilk basamak farmakolojik tedaviye yeterli yanıt vermezse, daha özel bir beslenme planı için diyetisyene yönlendirilebilirler. Bu durumda uygulanan başlıca alternatif yaklaşımlardan biri, fermente olabilen kısa zincirli karbonhidratların sınırlanmasına dayalı olan düşük FODMAP diyetidir (Colomier vd., 2022). FODMAP bileşenleri, bağırsakta zayıf emildiğinden suyun bağırsak lümenine çekilmesine neden olur ve kolona ulaştıklarında bağırsak bakterileri tarafından fermantasyona uğrayarak gaz üretir. Bu süreç bağırsak duvarında gerilmeye ve hareketlilik değişikliklerine yol açarak semptomların ortaya çıkmasına katkı sağlayabilir. Yapılan randomize kontrollü çalışmalar, düşük FODMAP diyetini uygulayan İBS'li bireylerin yaklaşık %50 ila %75'inde semptomlarda belirgin rahatlama sağlandığını göstermektedir (Halmos vd., 2014 ; De Roest vd., 2013). Ancak, bu durum aynı zamanda hastaların %25 ila %50'sinin bu yaklaşıma yanıt vermediğini ortaya koymaktadır. Bu nedenle, hangi bireylerin bu diyet tedavisinden fayda sağlayabileceğini önceden öngörebilmek, daha kişiselleştirilmiş ve etkili bir tedavi planı oluşturmak açısından büyük önem taşımaktadır (Bertin vd., 2024). İBS hastalarının belirli besin gruplarından kaçınmasına rağmen toplumdaki sağlıklı bireylerle kıyaslandığında günlük kalori, karbonhidrat, protein ve yağ alımı bakımından herhangi bir farka rastlanmamıştır.

Ancak çalışmalar düşük FODMAP'in uzun süre uygulanmasının demir, folat, magnezyum, kalsiyum, B ve C vitaminleri gibi temel besin maddelerinin yetersiz alımına neden olabileceğini göstermektedir (Bellini vd., 2020).

Fodmap diyet tedavisi

Avustralya'daki Monash Üniversitesi'nde 2005 yılında Dr. Sue Shepherd ve Prof. Peter Gibson başkanlığındaki araştırmacılar, FODMAP terimini ortaya attılar (Bertin vd., 2024). FODMAP'leri, özellikle İBS'li bireylerde gastrointestinal semptomları ortaya çıkarabilen belirli fermente edilebilir karbonhidratlar için bir kategorizasyon olarak kavramsallaştırdılar (Gibson vd., 2005). FODMAP, "Fermente Edilebilir Oligo-, Di- ve Mono-sakkaritler ve Polioller", yüksek derecede fermente olabilen ancak zayıf bir şekilde absorbe edilen kısa zincirli karbonhidratlar ve poliollerin heterojen dağılan bir grubudur (Catassi vd., 2017). FODMAP'ler çok çeşitli sebzelerde, meyvelerde, buğday ve tahıl gruplarında, süt ve süt ürünlerinde, baklagillerde ve tatlandırıcılarda yaygındır. Normal bir diyette toplam FODMAP alımı günlük 15 ila 30 gram arasında değişmektedir (Varney vd., 2017). Düşük FODMAP diyeti, İBS beslenme temelli tedavisinde yaygın olarak kullanılan ve bilimsel olarak desteklenen bir yaklaşımdır. Bu diyet iki temel yöntemle uygulanabilir: yukarıdan aşağıya ve aşağıdan yukarıya yaklaşım. Yukarıdan aşağıya yaklaşım, genellikle daha yaygın olarak tercih edilen ve daha fazla bilimsel kanıtla desteklenen bir yöntemdir. Bu yaklaşım üç aşamalı bir süreçten oluşur. İlk aşamada, FODMAP içeren tüm gıdalar kısa süreliğine diyetten tamamen çıkarılır. İkinci aşamada, bu besinler kontrollü bir şekilde ve tek tek yeniden diyete eklenerek bireysel tolere edilebilirlik değerlendirilir. Son aşamada ise, elde edilen tolere edilebilirlik verilerine göre kişiye özel ve sürdürülebilir bir beslenme düzeni oluşturulur. Aşağıdan yukarıya yaklaşım ise daha sınırlı ve hedefe yönelik bir stratejidir. Bu yöntemde başlangıçta sadece belirli FODMAP grupları diyetten çıkarılır. Eğer semptomlarda iyileşme sağlanmazsa, kısıtlamalar diğer FODMAP gruplarını da içerecek şekilde genişletilir. Her iki yöntem de İBS semptomlarının hafifletilmesinde etkili olabilir. Ancak mevcut araştırmalar, özellikle yukarıdan aşağıya yaklaşımın daha başarılı sonuçlar verdiğini göstermektedir. Bu nedenle, düşük FODMAP diyetinin uzman bir sağlık profesyoneli rehberliğinde uygulanması önerilmektedir (Singh vd., 2022). FODMAP'lerin bağırsak işlevini etkileyen üç temel özelliği olduğu düşünülmektedir. Bu özellikleri ince bağırsakta sınırlı düzeyde emilmeleri, küçük ve ozmotik olarak aktif moleküller olmaları, kalın bağırsakta hızlı bir şekilde bakteriyel fermantasyona uğramalarıdır (Bertin vd., 2024). Yetersiz emilim birden fazla mekanizmayla açıklanabilir. Örneğin, bazı bireylerde fırça kenarı enzimlerinden laktazın azalmış aktivitesi laktozun emilimini zorlaştırırken, fruktanlar ve galaktanlar için sindirici enzimlerin tamamen bulunmaması da bu maddelerin ince bağırsakta parçalanmadan kalın bağırsağa ulaşmasına neden olur. Ayrıca, polioller gibi bazı büyük moleküller, basit difüzyon yoluyla taşınamayacak kadar hacimlidir. Bunlara ek olarak, ince bağırsak epitelinde yer alan taşıyıcı proteinlerin yavaş çalışması ve düşük taşıma kapasitesine sahip olması da FODMAP emilimini sınırlandıran diğer etkenlerdendir. Özellikle fruktoz, GLUT taşıyıcı ailesine ait iki özel taşıyıcı protein yoluyla emilir. GLUT5 proteini yalnızca fruktoz taşımaya özelleşmişken, GLUT2 hem fruktoz hem de glikoz ile galaktoz taşınmasını sağlar. Fruktozun glikoz ile birlikte alınması, emilim etkinliğini artırabilir. Ancak, bu iki şeker arasında dengesizlik varsa, örneğin fruktoz alımı glikozdan fazlaysa, emilim bozulabilir ve fruktoz kalın bağırsağa ulaştığında burada mikrobiyal fermantasyona uğrar (Wilder vd., 2018). Sonuç olarak, FODMAP'lerin emilim kapasitesi; tüketilen miktar, bağırsak geçiş süresi, lümendeki glikoz düzeyi ve bireyin GLUT2 ve GLUT5 taşıyıcılarının etkinliği gibi çeşitli faktörlerden etkilenir. Bu bireysel farklılıklar, FODMAP' lere verilen yanıtların kişiden kişiye değişmesinin temelini oluşturur. Ozmotik etki, 1,4 beta galaktozid-fruktoz olarak da bilinen sentetik bir FODMAP olan laktuloz üzerinden

örneklendirilebilir. Galaktoz ve fruktozdan oluşan bu yapay disakkarit, vücut tarafından emilemez ve ince bağırsakta su miktarını artırarak bağırsak hareketlerini etkiler. Bu özelliği sayesinde yeterli miktarda alındığında müshil etkisi oluşturur. Bakteriyel fermantasyonun hızı ise karbonhidrat zincirinin uzunluğuna bağlıdır; oligosakkaritler ve basit şekerler, polisakkaritlere kıyasla daha hızlı fermente olur (Bertin vd., 2024).

Fermente Edilebilir Kısa Zincirli Karbonhidratlar

Sindirim için gerekli olan hidrolaz enzimlerinin eksikliği, düşük yoğunluğu ya da monosakkaritler söz konusu olduğunda ince bağırsaktan tam olarak emilememelerinden dolayı kolonda fermente olmaya uygun yapıdadırlar. Kısa zincirli fermente edilebilir karbonhidratlar bağırsakta hidrojen (H_2) ve metan (CH_4) gazlarının üretimini artırarak, visseral aşırı duyarlılığı olan bireylerde bağırsak içinde gerginlik ve buna bağlı ağrı hissine yol açabilir. Bu grupta öncelikle fruktoz, laktoz, fruktanlar, galaktooligosakkaritler ve polioller yer almaktadır.

Fruktanlar

Fruktanlar, inülin, oligofruktoz ve fruktooligosakkaritlerden (FOS) oluşan, fruktozdan meydana gelen kısa zincirli karbonhidratlardır. İnsan sindirim sistemi, bu bileşiklerdeki β-fruktozil-fruktoz bağlarını parçalayacak enzimlere sahip değildir. Bu nedenle, fruktanlar ince bağırsakta sindirilmeden kalın bağırsağa ulaşır. En yaygın fruktan kaynakları arasında buğday ve soğan gibi gıdalar yer alır. Bu besinlerde fruktan miktarı düşük olsa da, genellikle büyük porsiyonlarla tüketilirler. Fruktanların ayrıca prebiyotik özellik taşıdığı, yani bağırsak mikrobiyotasını olumlu yönde etkileyebildiği bilinmektedir (Staucher vd., 2014).

Galaktooligosakkaritler

Galaktooligosakkaritler (GOS), sindirimi için gerekli olan α-galaktozidaz enziminin insan vücudunda bulunmaması nedeniyle ince bağırsakta sindirilemez ve kolona ulaşarak burada fermente olur. Bu özellikleri sayesinde prebiyotik etkiler gösterirler. GOS'un temel kaynakları arasında baklagiller, bazı tahıllar, kuruyemişler, tohumlar ve anne sütü yer alır (Biesiekierski vd., 2011).

Laktoz

Laktoz, süt ve süt ürünlerinde bulunan bir disakkarittir ve sindirimi için laktaz enzimine ihtiyaç duyar. Laktaz enziminin etkinliği yaşla birlikte azalabilir; bu durum özellikle Akdeniz ve Asya kökenli bireylerde, ayrıca inflamatuvar bağırsak hastalıkları gibi durumlarda daha belirgin hale gelir. İBS hastalarında laktoz malabsorbsiyonu %18–82 oranında görülür ama bu oran genel nüfustan daha yüksek değildir (Yang vd., 2013).Birçok birey, diyet laktozunu sindirmek için yeterli laktaz üretimine sahiptir ve bu nedenle düşük FODMAP diyetinin bir parçası olarak laktozu kısıtlamaya ihtiyaç duymazlar.

Fruktoz

Fruktoz, FODMAP grubundaki en küçük molekül yapısına sahip olan monosakkarittir. Elma, armut, karpuz, mango gibi meyveler; bezelye gibi bazı sebzeler; bal ve yüksek fruktozlu mısır şurubu gibi ürünlerde bulunur. Fruktoz bağırsakta yavaş ve sınırlı şekilde emilir. Bu emilim süreci sırasında osmotik etkisi nedeniyle bağırsak lümenine su çeker ve bu da şişkinlik, karın ağrısı ve hatta ishal gibi semptomlara yol açabilir. Son araştırmalar fruktozun yalnızca emilemeyen kısmının değil, emilen kısmının da semptomlara katkıda bulunabileceğini göstermiştir. Bu nedenle, fruktozun emilim kapasitesinden çok, toplam alımı önem taşır (Murray vd., 2014).

Polioller

Polioller, şeker alkolleri olarak da bilinen ve özellikle sorbitol ile mannitol gibi bileşenleri içeren bir FODMAP grubudur. Elma, armut, erik, şeftali gibi meyveler; karnabahar, mantar ve bezelye gibi sebzeler doğal poliol kaynaklarıdır. Ayrıca ksilitol, izomalt gibi polioller birçok şekersiz sakız ve şekerlemede tatlandırıcı olarak kullanılır. Polioller ince bağırsakta yavaş emilir ve emilim düzeyine bakılmaksızın suyu bağırsağa çekerek osmotik etki oluşturur. Bu durum, şişkinlik, gaz ve dışkılama değişikliklerine neden olabilir. Bu nedenle polioller, İBS semptomlarının değerlendirilmesinde dikkate alınması gereken önemli bir faktördür (Yao vd., 2014).

Düşük Fodmap Diyeti Uygulaması

FODMAP açısından zengin besinlerin bireyde semptomlara yol açıp açmadığını belirlemek amacıyla bu tür gıdalar geçici olarak diyetten çıkarılır veya sınırlandırılır. Bu diyet yaklaşımı iki temel aşamadan oluşur. Birinci aşama, genellikle 4 ila 8 hafta sürer. Bu dönemde, yüksek FODMAP içeren tüm besinler diyetten uzaklaştırılır. Bu süreçte, bir öğünde alınan FODMAP miktarı 0,5 gramı, günlük toplamda ise 3 gramı geçmemelidir. İkinci aşama, yeniden tanıtım sürecidir. Bu aşamada, ilk olarak laktoz içeren süt ve süt ürünleri haftada üç gün olacak şekilde diyete yeniden dahil edilir. Eğer bu gıdanın eklenmesi semptomlarda belirgin bir kötüleşmeye neden olursa, ilgili gıda tekrar diyetten çıkarılır. Ancak herhangi bir semptom artışı gözlenmezse, bireyin bu besini daha yüksek miktarda tüketmesine izin verilir. Bu aşamadan sonra diğer FODMAP gruplarının yeniden tanıtımı planlı bir şekilde sürdürülür. Her yeni gıda eklemesinden önce genellikle 2-3 günlük bir dinlenme (arınma) süreci uygulanır. Bu sayede semptom takibi daha net bir şekilde yapılabilir (Zannetti vd., 2018). Son on yılda, Monash Üniversitesi Gastroenteroloji Bölümü, meyve, sebze, tahıl, tahıl ürünleri, süt ürünleri, et ürünleri, içecekler ve çeşniler gibi farklı gıda kategorilerinde FODMAP içeriğini belirlemek amacıyla kapsamlı araştırmalar gerçekleştirmiştir. Bu çalışmalar sonucunda, sürekli güncellenen ve birçok dilde kullanılabilen Monash Üniversitesi düşük FODMAP diyet uygulaması oluşturulmuştur. Bu uygulama sayesinde, doğru FODMAP verilerine dünya genelinde erişim kolaylaşmış ve diyetin etkin şekilde uygulanması desteklenmiştir (Muir vd., 2009). Günlük terapötik hedef olarak önerilen maksimum FODMAP alımı 12 gramdır. Genel nüfusun ortalama FODMAP tüketimi bu sınırın üstünde olup, yaklaşık 19,86 gram/gün olarak tahmin edilmiştir (Zanzer vd., 2024). Düşük FODMAP diyetinin eliminasyon fazında, çoğu katılımcı bu sınırın altında, yani günde 12 gramdan az FODMAP tüketmiştir. Özellikle fruktan alımı sıkı fazda 2,2 gramın altına düşmüş ve bu azalma uzun vadede de korunmuştur. Ancak düşük FODMAP için ideal bir eşik miktar henüz netleşmemiştir (Rej vd., 2021).

İBS'DE DÜŞÜK FODMAP DİYETİNİN ETKİNLİĞİ

İBS hastalarının büyük bir kısmı, besin tüketimi ile semptomlar arasında bir bağlantı olduğunu ifade etmektedir. Bu nedenle, yemek sonrası rahatsızlık yaşayan bazı hastalar diyetlerini ciddi şekilde kısıtlamakta ve belirli gıdalardan tamamen kaçınmaktadır. Bu durumu yaşayan hasta grubunda, semptomların daha yoğun seyrettiği, yaşam kalitesinin düştüğü, enerji alımının azaldığı ve çeşitli besin ögelerinin alımında eksiklikler yaşandığı gözlemlenmektedir (Melchior vd., 2021). Yemekle ilişkili semptomların bu kadar ön plana çıkması, İBS'de beslenmeye dayalı tedavi yaklaşımlarına olan ilgiyi artırmıştır. İBS için günümüzde önerilen başlıca diyet yaklaşımları üç grupta toplanmaktadır: geleneksel diyet önerileri (TDA), düşük FODMAP diyeti (LFD) ve glutensiz diyet(GFD). Geleneksel diyet yaklaşımı; düzenli öğün tüketimini, yağlı ve baharatlı yiyeceklerin, kafeinli, alkollü ve gazlı içeceklerin ve lif alımının sınırlandırılmasını önermektedir. Düşük FODMAP diyeti ise, porsiyon başına alınan toplam FODMAP miktarını azaltmayı hedefler. Düşük FODMAP diyetinin, İBS semptomlarını %70'e

varan oranlarda hafifletebildiği gösterilmiştir (Halmos vd., 2014). Prospektif, randomize bir çalışma İBS-D'li hastalarda düşük FODMAP diyeti ve geleneksel diyet tedavisinin etkilerini gözlemlemek için yürütülen bir çalışmada karın ağrısı sıklığı, karın şişkinliği ve bağırsak alışkanlıklarından memnuniyetsizlik TDA'ya kıyasla 4. haftada önemli iyileşme göstermiştir. Dışkı sıklığı ve formu önemli bir iyileşme gösteririken, IBS ilaç kullanımında azalma meydana gelmiştir (Goyal vd. 2021). Çalışmalarda FODMAP'lerin bağırsak epitel bariyerini geçirgen hale getirebileceği, bağışıklık sistemini aktive edebileceği ve düşük dereceli inflamasyonu tetikleyebileceği öne sürülmektedir. Bu etkilerin, İBS'nin ortaya çıkışında önemli bir rol oynayabileceği düşünülmektedir (Goyal vd. 2021) İBS hastalarında kişisel özelliklerin (bağırsak florası, psikolojik durum, yeme alışkanlıkları) hangi diyet tedavisine, hangi belirti (karın ağrısı, şişkinlik, kabızlık, ishal) için daha iyi yanıt verdiğini inceleyen bir araştırmada orta ve şiddetli IBS tanısı almış düşük FODMAP diyeti uygula ve geleneksel IBS diyeti uygulanmıştır. Her iki grupta da mikrobiyal yapı ve beslenme şekli, özellikle ağrı ve kabızlık semptomlarında iyileşme ile ilişkili bulunmuştur. Psikolojik stres düzeyi yüksek olan kişilerde ise şişkinlik şikayetinde iyileşme daha az olmuştur. Başlangıçta daha hafif semptomlara (yüksek kalori alımı olan, disbiyoz skoru düşük olan) sahip bireylerde anlamlı bir iyileşme gözlemlenmiştir. Ancak başlangıçta daha fazla FODMAP tüketen hastalar, geleneksel İBS diyetine daha iyi yanıt verirken düşük FODMAP diyetinde bu etki gözlenmemiştir. Hatta başlangıçta yüksek FODMAP tüketen hastalar düşük FODMAP diyeti sırasında şişkinlikte daha kötü yanıt göstermiştir. Eğer bir hasta günlük hayatında FODMAP'leri rahatsız edici bulmuyor ve bunlardan kaçınmıyorsa, çok katı bir diyet olan düşük FODMAP diyeti ona fayda sağlamayabilir (Colomier vd., 2022). En sık tüketilen oligosakkarit kaynaklarından biri olan buğday, İBS belirtilerinin en yaygın tetikleyicilerinden biridir. Ancak buğday bileşenlerinden hangisinin (fruktan veya gluten) IBS semptomlarına katkıda bulunduğu henüz açıklığa kavuşturulmamıştır (Bellini vd., 2020). Glutensiz beslenme, aynı zamanda fruktooligosakkaritlerin ve tahıla özgü bazı bileşenlerin alımını da sınırlandırmaktadır. Glutensiz bir diyet uygulanırken fruktan tüketiminin azaltılması, karın ağrısı gibi belirtilerde belirgin bir rahatlama sağlayabilir (Mohseni vd., 2022). İBS olan bireyler, özellikle diyare ağırlıklı alt tipe sahip olanlar, süt ve süt ürünleri gibi laktoz içeren besinleri tükettikten sonra semptomlarında artış yaşadıklarını fark ettikleri için bu tür gıdalardan kaçınma eğilimindedir. Bu nedenle pek çok İBS hastası, kendi deneyimlerine dayanarak süt ürünlerini tolere edemediklerini düşünmekte ve laktoz intoleransını kesin bir tanı olmaksızın varsayarak laktozsuz ürünlere yönelmektedir. Ancak, İBS hastalarında bildirilen laktoz intoleransı sağlıklı bireylere kıyasla daha yaygın görünse de, bu durum her zaman gerçek bir laktoz malabsorpsiyonuna bağlı olmayabilir (Özyürek vd., 2023). Krieger ve arkadaşlarının gerçekleştirdiği bir çalışmada 29 İBS hastası rastgele iki gruba ayrılarak biri düşük FODMAP diyeti, diğeri ise düşük laktozlu diyet uygulamak üzere müdahale sürecine alınmıştır. Müdahaleler 14 gün sürmüş, ardından 21 günlük bir arınma süresi verilerek gruplar diyetleri değiştirip yeniden uygulanmıştır. Çalışmanın sonunda her iki diyetin de İBS semptomlarını genel olarak anlamlı düzeyde azalttığı gözlemlenmiştir. Bununla birlikte, düşük FODMAP diyetinin, laktozsuz diyete kıyasla ağrı ve şişkinlik gibi belirli semptomların giderilmesinde daha etkili olduğu bulunmuştur (Krieger vd., 2020). Çift kör, randomize ve plasebo kontrollü bir klinik çalışmada İBS olan bireylerde düşük FODMAP içeren glutenli ve glutensiz diyetlerin semptomlar üzerindeki etkisi incelenmiştir. Altı hafta süren çalışmada, kontrol grubuna günlük 5 gram pirinç unu içeren düşük FODMAP diyeti uygulanırken, müdahale grubuna aynı miktarda gluten tozu verilmiştir. Bulgular, FODMAP'lerin diyetten çıkarılmasının çoğu hastada semptomları hafiflettiğini göstermiştir. Gluten içeren düşük FODMAP diyetinin ise genel olarak İBS hastalarında semptomlar veya yaşam kalitesi üzerinde olumsuz bir etkisi olmadığı belirlenmiştir. Bununla birlikte, hastaların yaklaşık %20'sinde glutenin doğrudan semptomların

nedeni olabileceği görülmüştür. Buğday ve arpanın İBS semptomlarını genellikle içerdiği fruktanlar nedeniyle tetiklediği, glutenin ise yalnızca daha küçük bir hasta grubunda etkili olduğu anlaşılmıştır. Bu sonuçlar, bazı İBS hastalarında çölyak dışı gluten hassasiyeti olabileceği görüşünü desteklemektedir. Düşük FODMAP diyetinin uygulanmasının zorlukları göz önünde bulundurulduğunda, özellikle Asya toplumları gibi yüksek FODMAP içeren gıdaların sıkça tüketildiği bölgelerde, bu diyete başlamadan önce bireylerde gluten duyarlılığının değerlendirilmesi önerilmektedir (Mohseni vd., 2022). İBS hastalarının bir kısmında visseral aşırı duyarlılık bulunmaktadır. Bu durum, aynı büyüklükteki (örneğin, gaz, şişkinlik ya da basınç gibi) uyarıların, bazı bireylerde daha güçlü semptomlara (ağrı, rahatsızlık) neden olabileceğini göstermektedir. İBS de düşük ve orta düzeyde FODMAP içeren diyetlerin GI semptomlar üzerindeki etkilerini karşılaştırmak amacıyla yürütülen çift kör, randomize, kontrollü bir çalışmada genel GI semptomlarının şiddeti, karın ağrısı yoğunluğu ve sıklığı, bağırsak alışkanlıklarından memnuniyetsizlik ve günlük yaşama etkisi IBS-D hastalarında diğer alt gruplara göre düşük FODMAP döneminden sonra azalmış, ancak orta FODMAP döneminden sonra azalmamıştır. Düşük FODMAP döneminden sonra, daha sert dışkı ve azalmış bir dışkı sıklığı kaydedilmesine rağmen orta FODMAP döneminde böyle bir etki görülmemiştir. Bu bulgular, düşük FODMAP diyetinin, IBS-C olanlara kıyasla IBS-D ve/veya IBS-M olan IBS hastalarında daha etkili olabileceğini göstermektedir; bu da önceki çalışmalarla uyumludur. FODMAP'a hassas olan kişiler FODMAP'a hassas olmayanlara göre düşük FODMAP sırasında daha kötü semptomlar yaşadığı tespit edilmiştir. Bunun muhtemel nedeni ise visseral hipersensitivite olduğunu düşünülmektedir (Algera vd., 2022). Gluten hassasiyeti, İBS olan bireylerin en sık dile getirdiği gıda kaynaklı yakınmalardan biridir. Bazı İBS hastalarında çölyak hastalığı bulunmamasına rağmen gluten alımı sonrasında intolerans benzeri belirtiler gözlemlenmiştir. Bu durum, glutenin İBS semptomlarını tetikleyebileceği düşüncesiyle glutensiz beslenme yaklaşımlarının önerilmesine neden olmuştur. Ancak, bu hassasiyetin çoğu zaman bağışıklık sistemi aracılığıyla değil, farklı mekanizmalarla geliştiği düşünülmektedir. Özellikle, bu semptomların, glutenle birlikte tüketilen ve bağırsakta tam sindirilemeyen fruktan adlı karbonhidratlara karşı gelişen bir intoleranstan kaynaklanabileceği öne sürülmektedir (Dionne vd., 2018). LFD ve GFD'nin TDA'ne kıyasla IBS semptomlarını iyileştirmede daha etkili olup olmadığını araştırmak için yapılan bir çalışmada diyetlerin klinik etkinlikte önemli ölçüde farklılık göstermediği belirtilmiştir. Mevcut çalışmada GFD grubunda çapraz kontaminasyon göz ardı edilmiş olup diğer yayınlar IBS'de GFD'nin çölyak hastalığında görülen kadar katı olması gerekmediğini öne sürmektedir. Makrobesinler ve mikrobesinler her bir diyet grubunda azalmış olsa da, GFD ve TDA ile karşılaştırıldığında LFD'de daha fazla lif azalması dışında gruplar arasında önemli bir fark görülmedi. LFD'nin TDA ve GFD ile karşılaştırıldığında disforide önemli bir iyileşme göstermesi dışında gruplar arasında farklılık gözlenmemiştir (Rej vd., 2022). Çeşitli araştırmalar, semptomların glikozdan ziyade oligofruktoz veya fruktoz tüketimiyle daha fazla ilişkili olduğunu ortaya koymuştur. Ayrıca, laktoz, fruktoz, fruktooligosakkaritler ve sorbitol gibi bireysel FODMAP bileşenleri; şişkinlik, karın ağrısı, mide bulantısı ile birlikte dışkılama sıklığında artış ya da azalma gibi IBS hastaları tarafından sıkça bildirilen semptomlara yol açabilmektedir (Major vd., 2017). Küçük ölçekli bir çalışmada, nefes testleri yoluyla fruktoz intoleransının işlevsel şişkinlik ve gazla ilişkili yakınmaların en yaygın nedeni olduğu gösterilmiştir. Bu doğrultuda, hastaların yaklaşık %65'inde karbonhidrat emilim bozukluğu saptanmış, bir aylık diyet kısıtlamasının ardından %80'den fazlasında semptomların azaldığı belirlenmiştir. Tedavinin bir yıl sürdürülmesiyle birlikte katılımcıların %50'sinde tamamen semptom kontrolü sağlanmıştır (Moshiree vd., 2023) . Çok sayıda klinik araştırma, özellikle karın şişkinliği gibi belirtilerin yönetiminde düşük FODMAP diyetinin etkili olduğunu göstermiştir; bu diyete uyan IBS hastalarının yaklaşık %50 ila %75'inde belirgin bir iyileşme sağlandığı bildirilmiştir (Mitchell vd., 2019).

Kolon bakterileri tarafından lüminal bağırsakta gerçekleşen fermantasyon, gazların (hidrojen, metan ve karbondioksit) yanı sıra ikincil yan ürünler olarak kısa zincirli yağ asitleri (SCFA) ve dallı zincirli yağ asitlerinin (BCFA) oluşumuna yol açar. Düşük FODMAP diyetinde fermantasyondaki varsayılan azalma teorik olarak SCFA üretiminde bir azalmaya yol açmalıyken, FODMAP' lerin dışkı SCFA'ları üzerindeki tutarsız etkileri gözlemlenmiştir. Yapılan son sistematik inceleme, düşük FODMAP diyeti ile kontrol diyetleri arasında toplam dışkı SCFA konsantrasyonunda hiçbir fark veya belirli SCFA'ların dışkı konsantrasyonlarında veya dışkı pH'ında hiçbir fark bulamamıştır (So vd., 2022). Bu durumun aksine IBS için Geleneksel Diyet Tedavisine kıyasla Akdeniz tarzı düşük FODMAP Diyeti'nin (MED-LFD) etkinliğini ve dışkı uçucu bileşik seviyelerindeki değişiklikleri değerlendirmek için yapılan bir çalışmada her iki grupta da IBS-SSS'de anlamlı bir azalma gözlemlendi. Ancak MED-LFD grubundaki hastalar TDA grubuna kıyasla yaklaşık iki kat semptom iyileşmesi göstermiştir. Çalışma, beslenme müdahalesinin dışkıdaki SCFA ve BCFA düzeylerini azalttığını göstermiştir. Bu durum, tedavi başarısının potansiyel bir göstergesi olabilir. MED-LFD grubunda dışkı formlarında ve anksiyete, depresyon ölçeklerinde anlamlı iyileşmeler olduğu vurgulanmıştır (Kasti vd., 2025).

DÜŞÜK FODMAP DİYETİ VE BAĞIRSAK MİKROBİYOTASI

Kalın bağırsaktaki mikrobiyota, sindirilmeden oraya ulaşan karbonhidratları fermente ederek gaz ve biyolojik olarak aktif metabolitler üretir. Bu nedenle, bağırsak mikrobiyota profili, düşük FODMAP diyetine verilen yanıtı etkileyen temel faktörlerden biri olarak öne sürülmüştür. Yetişkin IBS hastalarında, düşük FODMAP diyetine yanıt vermeyenlerin bağırsak mikrobiyotası başlangıçta daha yüksek bir disbiyoz indeksi taşımaktadır. Bu kişilerde özellikle IBS ile ilişkili olduğu bilinen Dorea, Ruminococcus gnavus ve Streptococcus türlerinin göreceli oranı daha yüksektir. Bunun ardından yapılan çok sayıda çalışmada, diyete olumlu yanıt verecek mikrobiyal profili tanımlamak hedeflenmiştir, ancak bu konuda hâlâ açık ve tutarlı bir model bulunamamıştır (De Palma ve Bercik, 2022). Bazı ilk çalışmalarda, sadece diyete yanıt vermeyen kişilerde belirli bakterilerin arttığı görülmüştür. Ama daha sonraki araştırmalarda, diyete iyi yanıt veren kişilerde bile bu bakterilerin fazla olduğu tespit edilmiştir: Bacteroides fragilis, Acinetobacter, Ruminiclostridium, Streptococcus, Eubacterium (Zhang vd., 2021). Birçok çalışma, fermente olabilen karbonhidratların kısıtlanmasının, probiyotik etkileriyle bilinen faydalı Bifidobacterium türlerinin miktarını azalttığını kabul etmektedir. Bifidobacteria adı verilen faydalı bakteriler, fruktanlar gibi bazı lif türlerini kullanarak yaşarlar. Bu lifleri parçalama ve sindirme özellikleri onların metabolik yetenekleridir. Ancak düşük FODMAP diyeti fruktanları da kısıtladığı için, bu bakterilerin besin kaynağı azalır. Dolayısıyla bu bakterilerin sayısında da azalma olur. Bu durum uzun vadede zararlı olabilir. Bu durumun önüne geçmek için bazı klinik çalışmalar, düşük FODMAP diyetinin neden olduğu Bifidobakterium azalmasını önlemek için probiyotik veya prebiyotik takviyeleri test etmiştir (De Palma ve Bercik, 2022). Prebiyotik takviyesi, Bifidobakterium kaybını engelleyememiştir; ancak probiyotik takviyesi, Bifidobacterium türlerini başlangıç seviyelerinde koruyabilmiştir (Wilson vd., 2020). Staudacher ve arkadaşlarının yaptığı bir çalışma, diyetisyen rehberliğinde ve gözetiminde uygulanan düşük FODMAP diyetinin, uzun vadede bifidobakterileri olumsuz etkilemediğini, ancak bağırsaktaki SCFA üretimini değiştirebileceğini göstermiştir (Staudacher vd., 2022). Düşük FODMAP-Glutensiz diyetin 6 haftalık müdahale süresi boyunca (LF-GFD) IBS'li İranlı hastalarda klinik semptomlar, bağırsak mikrobiyotası çeşitliliği ve dışkı kalprotektin (FC) düzeyine etkileri değerlendirilmiştir. IBS hastalarında yapılan mikrobiyota analizlerinde, diyet öncesinde Firmicutes filumunun Bacteroidetes filumuna göre baskın olduğu gözlemlenmiştir. Diyet müdahalesi sonrasında ise Bacteroidetes filumunda artış meydana gelmiş ve buna bağlı olarak Firmicutes/Bacteroidetes (F/B) oranında bir azalma

kaydedilmiştir. Ayrıca Actinobacteria, Bifidobacterium ve Lactobacillus cinslerine ait bakteriler de artış gözlemlenmiştir. Ancak bazı çalışmalarda, IBS hastalarında IBS olmayan bireylere kıyasla Bacteroidetes ve Actinobacteria filumlarının göreli bolluğunda artış olduğu bildirilmiştir. Ayrıca, düşük FODMAP içeren diyetlerin IBS hastalarında, glutensiz diyetlerin (GFD) ise çölyak hastalarında Bifidobacterium düzeylerini azalttığı gösterilmiştir. Bu bulgular, bağırsak mikrobiyotasındaki değişikliklere ilişkin çelişkili sonuçlar ortaya koymaktadır. Çalışmada, hastaların yarısından fazlasında diyet müdahalesinden önce anormal FC değerleri (çoğunlukla IBS-D alt grubunda) vardı. Mikrobiyotada meydana gelen değişikliklerin IL-6 ve IL-8 gibi proinflamatuar sitokinleri indükleyebileceği ve bu nedenle hastaların kronik düşük dereceli inflamasyondan muzdarip olabileceği bildirilmiştir. Sonuç olarak LF-GFD tüketimi ile FC azalması arasında anlamlı bir korelasyon mevcuttur (Naseri vd., 2021).

FODMAP DİYET TEPKİ BELİRTEÇLERİ

IBS tedavisinde diyetin başarısını artırmak için, hangi hastaların bu diyetten daha fazla fayda görebileceğini belirlemeye yönelik çalışmalar yapılmıştır. Bu kapsamda, diyet tedavisine verilecek yanıtı önceden tahmin edebilecek bazı faktörleri belirlemeye yönelik araştırmalar yürütülmüştür (Black vd., 2022).

Nefes Testi

FODMAP içeren yiyeceklerin bağırsakta fermantasyonu sonucu oluşan H_2 gazı nefes yoluyla ölçülmesiyle elde edilir. Yapılan bir çalışmada katılımcılara yüksek FODMAP içeren bir öğün verilmiştir. Ardından, katılımcıların nefesindeki hidrojen gazı seviyesi ölçülmüştür. Eğer bu seviye, başlangıç değerinin 10 PPM üzerinde artıyorsa ve kişi aynı zamanda semptom (gaz, şişkinlik, ağrı vs.) yaşıyorsa, bu "pozitif test" olarak kabul edilmiştir. Bu test, kişinin düşük FODMAP diyetinden fayda görüp görmeyeceğini tahmin etmekte %78,6 duyarlılık, %66,6 özgüllük, %75,6 doğruluk ile ortalama bir başarı göstermiştir (Ghoshal vd., 2020).

Dışkı ve İdrar Metabolitleri

Dışkı uçucu organik bileşiklerinin spesifik profilleri, düşük FODMAP diyetine yanıtı tahmin etmede dikkate değer bir doğruluk sergilemiştir. Bireyin düşük FODMAP diyetinden fayda görüp görmeyeceği, diyet başlamadan önce dışkı ve idrar analizleriyle tahmin edebilir (Ricco vd., 2018). Wilson ve arkadaşlarının yürüttüğü yakın tarihli, çift kör randomize kontrollü bir çalışmada, IBS hastalarına plasebo bir diyet veya düşük FODMAP diyeti uygulanmıştır. Çalışma, başlangıçta dışkıda bulunan bazı metabolitlerin (yüksek düzeyde propiyonat ve sikloheksan karboksilik asit esterleri) ve idrardaki metabolitlerin, düşük FODMAP diyetine yanıt veren hastaları ayırt edebildiğini ve bu sonuçların önceki bulgularla uyumlu olduğunu göstermiştir (Wilson vd., 2023). Ancak yakın zamanda Birleşik Krallık'ta yapılan bir çalışma aynı başarıyı gösterememiştir. Bu durum, bu alandaki belirsizliği ortaya koymakta ve düşük FODMAP diyetinin bağırsak mikrobiyotası üzerindeki etkileri konusunda daha fazla araştırma yapılması gerektiğini vurgulamaktadır.

Mikrobiyota Analizleri

Düşük FODMAP diyetine başlama bağlamında tedavi yanıtlarının potansiyel öngörücüleri arasında belirli bakterilerin bileşimi ve zenginliği yer almaktadır. Ancak çalışmalarda bireysel mikrobiyal türlerle ilgili çelişkili sonuçlar mevcut olduğundan gelecekteki araştırmalarla bu durumun açıklığa kavuşturulması gerekmektedir.

Düşük fodmap diyetinin dezavantajları

Sosyal ve Yaşam Tarzı Zorlukları

Özellikle, düşük FODMAP diyetinin ilk aşaması sosyal durumlarda zorluklara yol açabilir ve titiz bir yemek planlaması gerektirebilir, bu da bazı bireyler için yaşam tarzı karmaşıklıklarını beraberinde getirir. IBS hastalarının yer aldığı ve katılımcıların rastgele şekilde düşük FODMAP diyeti veya kontrol diyeti gruplarına atandığı iki randomize kontrollü çalışmanın ikincil analizinde, araştırmacılar uzman bir diyetisyen eşliğinde uygulanan 4 haftalık düşük FODMAP diyetinin toplam besin alımı ya da diyet çeşitliliği üzerinde anlamlı bir etkisi olmadığını belirlemiştir. Bununla birlikte, kontrol diyetleriyle karşılaştırıldığında düşük FODMAP diyetinin genel diyet kalitesini azalttığı görülmüştür. Diyet kalitesi, Sağlıklı Diyet Göstergesi ve Sağlıklı Diyet Puanı gibi ölçütlerle değerlendirilmiştir (Staudacher vd., 2020). IBS hastalarında TDA, düşük FODMAP diyeti ve GFD'nin etkinliğini ve tatmin ediciliğini karşılaştıran yakın tarihli bir karşılaştırmalı RCT'de, kişiler TDA'nın daha uygun maliyetli olduğunu, alışveriş için daha az zaman gerektirdiğini ve düşük FODMAP diyetine kıyasla günlük yaşamda takip edilmesinin ve uygulanmasının daha kolay olduğunu bildirdiler (Rej vd., 2022).

Beslenme Rehberliği

Düşük FODMAP diyetinden en iyi sonuçları elde edebilmek, diyetin karmaşıklığı ve yüksek gıda maliyetleri gibi zorlukların üstesinden gelebilmek, uygun alternatif gıdaları belirlemek ve diyet uyumunu artırmak için bir diyetisyenle iş birliği yapılması oldukça önemlidir. Ancak bazı sağlık merkezlerinde diyetisyen desteğine kolayca ulaşılamaması, farklı eğitim yöntemlerinin işe yarayıp yaramayacağı konusunu gündeme getirmektedir. Güncel randomize kontrollü bir çalışmada, fonksiyonel gastrointestinal bozuklukları olan hastalara düşük FODMAP diyeti kapsamında üç farklı eğitim yöntemi sunulmuştur: kitapçık, mobil uygulama ve diyetisyen danışmanlığı. Sonuçlar, diyetisyen rehberliğinde eğitim alan bireylerin, semptomlarını bağımsız şekilde kontrol etmede kendilerini daha yetkin hissettiklerini göstermiştir (Dimidi vd., 2023).

Beslenme Eksiklikleri

Son dönemde yapılan çalışmalar, düşük FODMAP diyetinin besin açısından yeterliliğini değerlendirmeye odaklanmıştır. Bu alandaki bulgular tutarsızlık göstermektedir; özellikle karbonhidrat alımının azalmasına bağlı olarak en sık karşılaşılan yetersizliklerden biri lif tüketiminde azalmadır. Süt ürünlerinin aşırı düzeyde diyetten çıkarılması, kalsiyum alımında azalmaya neden olabilirken; sebze ve meyve tüketimindeki kısıtlamalar, B1, B2, B9 ve D vitaminlerinde yetersizlikle ilişkilendirilmektedir. Ayrıca demir eksikliği vakaları da bildirilmiştir. Enerji alımındaki düşüşe bağlı olarak kilo kaybı da görülebilmektedir. Her ne kadar düşük FODMAP diyetine dair uzun vadeli etkiler konusunda yeterli veri bulunmasa da, bu diyetin sağlık uzmanları tarafından izlenerek uygulanması, olası besin eksikliklerinin önlenmesine yardımcı olabilir (Berfin vd., 2024). Modifiye edilmiş NICE diyeti ile düşük FODMAP diyetini 4 haftalık bir süre boyunca karşılaştıran bir randomize kontrollü çalışmanın post hoc analizinde, düşük FODMAP diyeti uygulayan katılımcıların günlük kalori alımında ve bazı temel mikrobesin düzeylerinde azalma gözlemlenmiştir. Ancak, kalori alımındaki değişiklikler dikkate alınarak yapılan değerlendirmede, yalnızca riboflavin düzeyindeki düşüş istatistiksel olarak anlamlı bulunmuştur (Eswaran vd., 2020). Uzun vadeli bulgular, düşük FODMAP diyetinin beslenme açısından yeterli olabileceğine işaret etmektedir. Son araştırmalar, uzun süreli uygulamalarda düşük FODMAP diyeti ile geleneksel beslenme düzeni arasında besin öğeleri açısından anlamlı bir fark bulunmadığını göstermektedir (Rej vd., 2021)

. Zamanla düşük FODMAP diyeti uygulayan bireylerde toplam enerji ve makro besin alımında azalma gözlenmiş olsa da, bu durum genellikle IBS hastalarının değişen yeme davranışlarıyla ilişkilidir. Birçok IBS hastasının önerilen beslenme hedeflerini karşılayamaması, bu düşüşün altında yatan temel nedenlerden biridir. Ayrıca, bu gruptaki besin eksikliklerinin başlıca sebepleri arasında yetersiz beslenme danışmanlığı ve bireylerin kendi kendine uyguladığı kısıtlamalar yer almaktadır (Eswaran vd., 2020).

Konstipasyon

Düşük FODMAP diyetinin potansiyel dezavantajlarından biri, lif alımının sınırlanması nedeniyle kabızlık semptomlarının kötüleşme riskidir. Bu durum özellikle liften zengin FODMAP içeren gıdaların diyetten çıkarılmasıyla ilişkili olabilir. So ve çalışma arkadaşlarının yürüttüğü yakın tarihli bir randomize çapraz tasarımlı araştırmada, IBS tanısı almış bireyler, yalnızca lif içeriği açısından farklılık gösteren üç farklı düşük FODMAP diyetini uygulamıştır. Araştırma bulgularına göre, düşük FODMAP diyeti süresince lif takviyesi yapılmasının bireylerin bağırsak hareketlerine dair algılarında belirgin bir değişiklik oluşturmadığı görülmüştür. Bununla birlikte, kontrol diyetleriyle karşılaştırıldığında dışkının su içeriğinde artış ve kolon geçiş süresinde normalleşme gibi olumlu etkiler gözlemlenmiştir (So vd., 2022).

Yeme Bozuklukları ve Psikiyatrik Eşlik Eden Durumlar

Düşük FODMAP diyetinin başlangıç aşamasındaki kısıtlamalar, hastaların duygusal iyilik hali üzerinde olumsuz etkiler yaratabilir. İBS semptomlarının kötüleşme ihtimali ve diyet kısıtlamalarıyla ilgili endişeler, anksiyete düzeylerinde artışa yol açarak yeme bozukluklarının ortaya çıkmasına zemin hazırlayabilir (Sultan vd., 2022). Özellikle, kaçınmacı-kısıtlayıcı yeme bozuklukları ile ortoreksiya nervoza, düşük FODMAP diyeti uygulayan bireylerde en sık görülen yeme bozuklukları arasında yer almaktadır. Bu nedenle, yeme bozukluğu öyküsü olan kişilere düşük FODMAP gibi kısıtlayıcı diyetlerden kaçınmaları önerilmektedir. Ayrıca, bu bireylerde yetersiz beslenme riskini değerlendirmek amacıyla ön tarama yapılması faydalı olacaktır (Bellini vd., 2020). Bunun yanı sıra, bilişsel kısıtlamalar ve ağır psikiyatrik hastalıklar, hastaların kendileri için önemli olan yiyecek tetikleyicilerini belirlemelerini, kısıtlayıcı diyetlere uyum sağlamalarını ve klinik yanıtlarını doğru şekilde raporlamalarını güçleştirebilir (Bertin vd., 2024).

SONUÇ VE ÖNERİLER

Düşük FODMAP diyeti İBS yaşayan bireylerde semptomların (karın ağrısı, şişkinlik, kabızlık, ishal vs.) azaltılmasında etkili ve güvenilir bir yöntem olarak öne çıkmaktadır. Uzun süreli veriler ne kadar yetersiz olsa da (potansiyel besin eksiklikleri ve bağırsak mikrobiyomu üzerindeki etki) bireyin semptomlarını uzun vadede daha etkili şekilde yönetmesine yardımcı olmakta ve yaşam kalitesini arttırmaktadır. Düşük FODMAP diyeti FODMAP içeren besinlerin diyetten sınırlı bir süre çıkartılıp tekrar tanıtıldığı aşamalı ve beslenme uzmanı tarafından sıkı takip gerektiren bir diyettir. FODMAP diyeti uygulanırken, beslenme dengesinin korunması ve vücudun ihtiyaç duyduğu tüm besin öğelerinin yeterli şekilde alınabilmesi için bu sürecin bir diyetisyen eşliğinde yürütülmesi büyük önem taşır. Günümüzde İBS'nin yönetiminde en etkili yaklaşımlar, ilaç tedavisi, beslenme düzenlemeleri ve psikolojik destek gibi çeşitli yöntemlerin bir arada kullanıldığı bütüncül bir bakım modelini önermektedir. Düşük FODMAP diyetinin etkinliği, özelleştirilebilirliği onu İBS'den (özellikle İBS-D) kurtulmak isteyenler için umut vadeden bir seçenek haline getirmektedir. Uzun vadeli etkinlik ve uyumla ilgili bilgiler şu anda kısıtlı olsa da gözlemsel çalışmalardan elde edilen ilk bulgular umut vadetmektedir. Gelecekte yapılacak uzun süreli daha çok çalışmaya ihtiyaç duyulmaktadır.

ÖZET

Tuz stresi çimlenme, bitki büyüme ve gelişimini olumsuz etkileyen en önemli abiyotik stress koşullarından biri olarak değerlendirilmektedir. Silisyum temel bir besin maddesi olarak geniş çapta tanınmamakla birlikte, genellikle bitki büyümesi, fizyolojik/metabolik yolak, hücre yapısı ve çok çeşitli abiyotik ya da biyotik çevresel streslerin hafifletilmesi için yararlı olan "değerli bir element" veya "yapısal element" olarak kabul edilmektedir. Birçok çalışma farklı bitki türlerinde tuzluluk, ağır metal stresi, kuraklık gibi abiyotik stres koşullarında bitki büyüme ve gelişmesi ile verimi artırmadaki rolünü doğrulamıştır. Bu çalışmada, nano silisyum (NSi) uygulamalarının tuz stresi koşullarında CU40 (hassas) ve CU159 (tolerant) kavun genotiplerinde çimlenme oranı, çimlenme zamanı, çıkış oranı ve hızı, radikul yaş ağırlığı ile fide gelişimi üzerindeki etkileri değerlendirilmiştir. Bu amaçla tuz stresi 150 mM düzeyinde uygulanırken; Nano-Si (NSi) uygulaması için; 0.5 ve 1 mM olmak üzere 2 farklı konsantrasyon çalışmaya dahil edilmiştir. İncelenen tüm parametreler bakımından kontrol bitkilerine oranla azalma meydana gelirken çimlenme hızı tuz stresi ile birlikte artış göstermiş, bu artış hassas CU40 genotipinde belirginleşmiştir. NSi uygulamaları tuz stresinin olumsuz etkisini her iki genotipte de sınırlandırmıştır. Bununla birlikte çimlenme hızı %6-20 oranında iyileşmiştir. Fide yaş ve kuru ağılıkları stres koşullarında kontrol bitkilerine oranla %26-71, kök yaş ve kuru ağılıklarında %43-76 oranında azalırken; NSi uygulamalarında bu oran fide yaş ve kuru ağırlıklarında %13-46, kök yaş ve kuru ağırlıklarında ise %22-54 oranında meydana gelmiştir. NSi uygulamaları kavunda çimlenme, çıkış ve fide gelişimi bakımından tuz stresinin olumsuz etkilerini sınırlandırmada etkili olmuş, bu etki 0.5 mM NSi uygulamasında daha belirgin gerçekleşmiştir.

EFFECTS OF NANO-SILICON ON GERMINATION AND SEEDLING DEVELOPMENT OF MELON GENOTYPES UNDER SALT STRESS

ABSTRACT

Salt stress is considered one of the major abiotic stress factors that adversely affect seed germination, plant growth, and development. Although silicon (Si) is not widely recognized as an essential nutrient, it is commonly regarded as a “beneficial” or “structural” element due to its positive effects on plant growth, physiological/metabolic pathways, cell structure, and its ability to alleviate a broad range of abiotic and biotic stresses. Numerous studies have confirmed its role in enhancing plant growth, development, and yield under various abiotic stress conditions such as salinity, heavy metal toxicity, and drought across different plant species. In this study, the effects of nano-silicon (NSi) treatments on germination percentage, germination time, emergence rate and speed, hypocotyl fresh weight and length, and seedling development were evaluated in two melon genotypes CU40 (sensitive) and CU159 (tolerant) under salt stress. Salt stress was imposed at 150 mM NaCl, while NSi treatments were applied at two concentrations: 0.5 and 1 mM. Compared with the control, all examined parameters decreased under salt stress; however, germination speed increased, particularly in the sensitive genotype CU40. NSi treatments mitigated the adverse effects of salt stress in both genotypes, improving germination time by 6–20%. While seedling fresh and dry weights decreased by 26–71% and root fresh and dry weights by 43–76% under stress compared to the control, these reductions were limited to 13–46% (seedling fresh/dry weight) and 22–54% (root fresh/dry weight) with NSi applications. Overall, NSi treatments were effective in reducing the negative impacts of salt stress on germination, emergence, and seedling development in melon, with the 0.5 mM NSi concentration showing more pronounced benefits.

INTRODUCTION

The progressive expansion of soil salinization has become a major constraint on crop performance, threatening both agricultural productivity and ecological sustainability. Each year, approximately 10% more arable land becomes affected by salt accumulation. Soils classified as saline typically exhibit an electrical conductivity above 4.0 dSm^{-1} (roughly equivalent to 40 mM NaCl), a condition that markedly interferes with plant growth and physiological functioning (Liu et al., 2024). Exposure to salinity alters plants' morphological, biochemical, and physiological traits, ultimately leading to reduced yield potential (Achary et al., 2024). As the salt concentration in the rhizosphere increases, plants tend to accumulate excessive sodium (Na^+) and chloride (Cl^-) ions. Of these, chloride ions are particularly detrimental, as they trigger osmotic imbalance, ion toxicity, and nutrient deficiency within plant tissues (Singh et al., 2024).

Seed germination in halophytic species is also adversely affected by high salinity, as many of these plants prefer to germinate in fresh water or under very low salt concentrations. The inhibitory effect of salinity on germination may result from ion toxicity or osmotic stress caused by a reduction in water potential around the seeds. This increase in the osmotic pressure of the soil solution limits water uptake, thereby delaying or preventing the initiation of germination. Furthermore, excessive intracellular accumulation of salts can deactivate key enzymes required for germination and hinder the release from seed dormancy (Al-Janabia et al., 2024).

Nanoparticles (NPs), also known as nano-scale particles (NSPs), are small particles with sizes ranging from 1 to 100 nm. These particles have gained significant attention in agricultural applications, functioning as growth stimulants, herbicidal agents, nano-pesticides, and nano-fertilizers. When applied in small quantities, nano-fertilizers enhance nutrient use efficiency and mitigate the toxic effects that often result from the excessive accumulation of conventional chemical fertilizers and pesticides in the soil. In addition, they play a crucial role in strengthening plants' resistance to both abiotic and biotic stresses by modulating key physiological and biochemical pathways (DeRosa et al., 2010; Siddiqui et al., 2015; Saxena et al., 2016).

In this study, the effects of NSi seed applications on germination and early seedling development in melon genotypes that are tolerant and sensitive to salt stress were investigated.

MATERIAL AND METHOD

In this study, salt-tolerant (CU159) and salt-sensitive (CU40) melon genotypes were used as plant materials (Kusvuran et al., 2010). A 150 mM NaCl treatment was applied to induce salt stress. Germination tests were conducted in petri dishes between filter papers with four replications, each consisting of 25 seeds. Emergence tests were performed by sowing 25 seeds per replication into peat-filled seedling trays, also arranged in four replications. Both germination and emergence experiments were carried out under controlled climate chamber and greenhouse conditions at 25 °C with a photoperiod of 16 h light and 8 h dark. Melon seeds that produced a radicle at least equal to the seed length were considered germinated and counted daily for eight days. In emergence tests, seedlings that reached the peat surface and developed cotyledons were recorded daily for ten days.

Germination and emergence percentages were calculated as proportions (%), while germination and emergence times were determined in "days" according to ISTA (1993) and Öztürk et al. (2021). In addition, hypocotyl fresh weight, hypocotyl length, and radicle length were measured. Melon seeds subjected to different NSi treatments were sown in seedling trays filled with a peat: perlite (2:1) mixture under greenhouse conditions to evaluate seedling

characteristics. The experiment was conducted with three replications, each consisting of 25 plants. At the end of the study, emergence percentage, emergence speed, and seedling fresh and dry weights (g plant^{-1}) were determined.

Statistical analyses were performed using the JMP software package based on a completely randomized design with three replications. The effects of the treatments were evaluated through analysis of variance (ANOVA), and differences among means were compared using the Least Significant Difference (LSD) multiple comparison test.

RESULTS AND DISCUSSION

Saline environments negatively affect both the speed of seed germination and the uniformity of seedling growth. Consequently, seed priming has emerged as a practical pre-sowing strategy to improve seed adaptation under stress conditions. This technique enhances stress tolerance by promoting early metabolic activation, boosting antioxidant defenses, and increasing the accumulation of beneficial metabolites all of which contribute to improved crop performance. Treating seeds with growth-promoting agents prior to exposure to adverse conditions induces a form of stress memory. This physiological imprinting enables primed seeds to better withstand environmental constraints during germination, seedling establishment, and subsequent growth stages. Recent findings from nanopriming studies demonstrate that, compared with conventional priming approaches, the use of nanoparticles (NPs) accelerates water uptake and promotes faster radicle emergence (Hameed et al., 2021; Singh et al., 2024).

In the study, salt stress reduced germination percentage in both genotypes, while germination time increased under stress conditions. However, with the application of NSi, germination percentage improved by 17–61%, and germination time decreased by 25–46%. Similarly, emergence percentage decreased by 46% in the CU40 genotype and by 29% in the CU159 genotype under salt stress; with NSi treatments, this reduction was limited to 9–17%. The highest hypocotyl fresh weight in control plants was recorded in the CU40 genotype at 0.40 g. The longest hypocotyl length was observed in the CU159 genotype (8.16 cm), while the greatest root length was recorded in CU40 (15.58 cm). Salt stress caused a reduction of approximately 22–75% in hypocotyl fresh weight, hypocotyl and root length, with the greatest decrease observed in the CU40 genotype. With NSi treatments, improvements of 16–107% were achieved, reducing the negative effects of salt stress to only 2–55% compared to control plants (Figure 1). In tomato, NSi powder significantly improved germination parameters such as germination percentage, germination index, vigor index, mean germination time and average shoot length of tomato (Lu et al., 2015). Alsaeedi, et al. (2019) indicated that the effects of five rates of nano-silica (NSi) suspensions (0, 100, 200, 300 and 400 mg L^{-1}) on cucumber (*Cucumis sativus*) seed germination and growth development, it was reported that 200 mg L^{-1} rate significantly increased the final germination percentage, germination speed, viability index and germination index by 28.7%, 70.3%, 46.7% and 68.8%, respectively, compared to untreated seeds, and reduced the average germination time by 31.7%. Similarly, 200 mg L^{-1} NSi had the highest fresh and dry germination weight, and all NS treatments improved seed germination and growth development compared to the control. Our findings indicate that NSi had a positive impact on the germination percentage and germination time of melon seedlings under salt stress. This result is in line with a study conducted by Sembada et al. (2023) and Acharya et al. (2024), in which they observed improved germination of tomato (*Solanum lycopersicum*) seeds when subjected to silica nanoparticles.

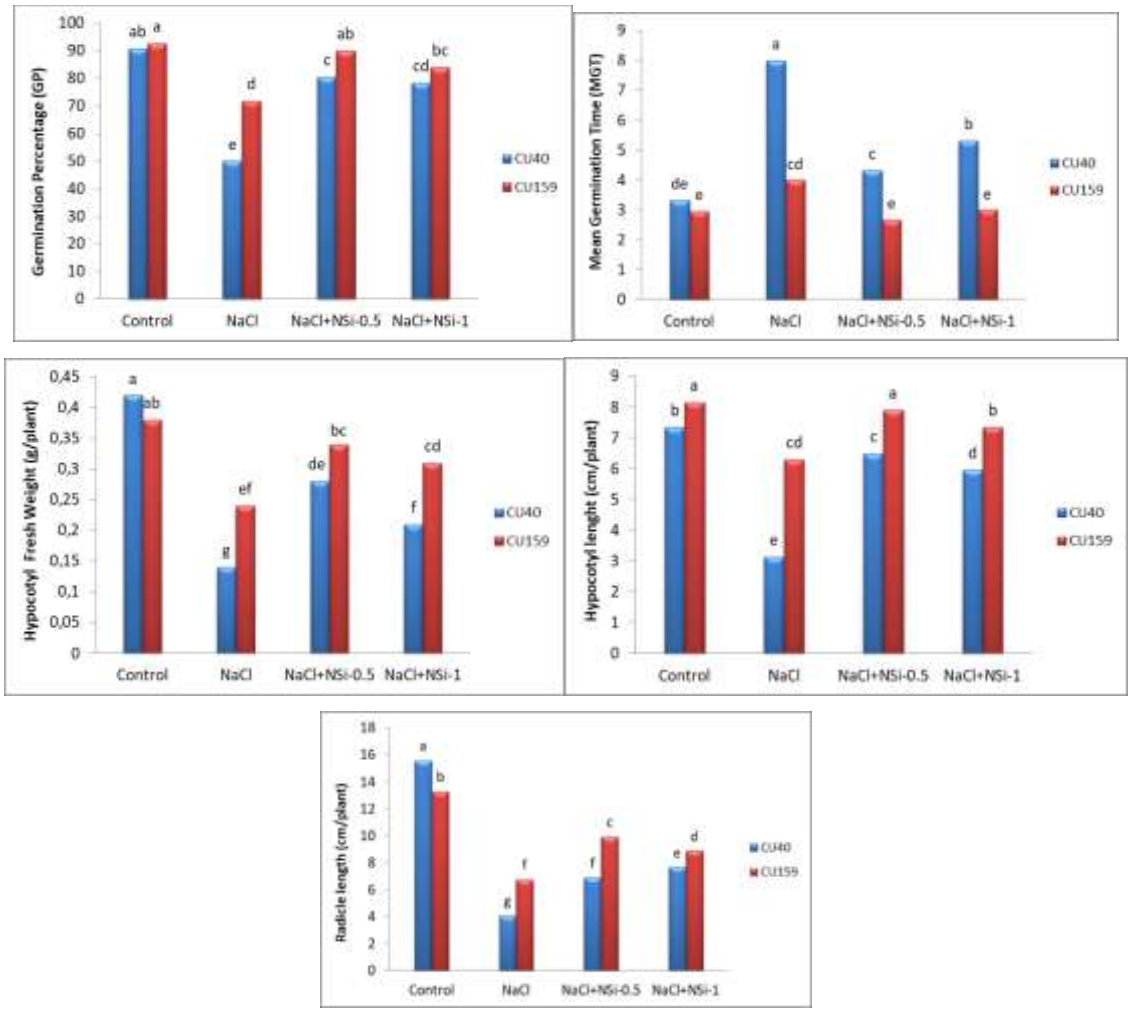

Figure 1. Effects of NSi application on germination parameters under salt stress condition

The melon seedling emergence rate and emergence speed varied depending on salt stress. Under stress conditions, the emergence rate decreased by 47% in the genotype CU40 and by 29% in CU159, compared with the control plants. Conversely, emergence speed increased under stress by 59% in CU40 and by 27% in CU159. NSi applications improved the emergence rate by 21–67% and the emergence speed by 6–29% under stress conditions. While the emergence rate increased, days to emergence decreased following NSi treatments (Figure 2).

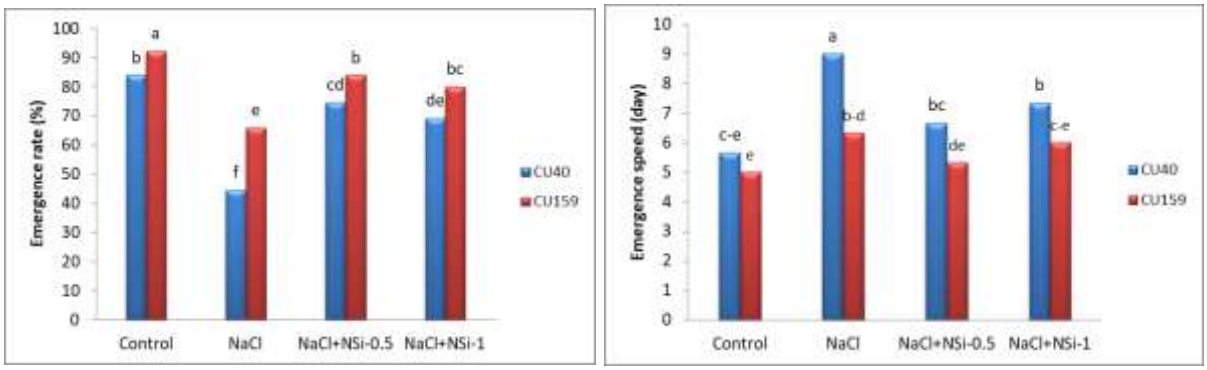

Figure 2. Effects of NSi application on emergence rate (%) and speed (day) under salt stress condition

In the study, where seedling and root fresh/dry weights were also evaluated, seedling fresh and dry weights decreased under salt stress by 55% and 71% in the CU40 genotype, and by 26% and 39% in the CU159 genotype. With NSi applications, these reductions were limited to 32–46% in CU40 and 13–36% in CU159. Regarding root fresh and dry weights, salt stress caused reductions of 76% and 69% in CU40, and 43% and 49% in CU159. Under NSi treatments, the decrease in root fresh and dry weights remained at 34–51% for the CU40 genotype and 22–38% for CU159. Overall, NSi applications provided improvements of 5–176% in seedling and root fresh/dry weight parameters under salt stress conditions (Figure 3).

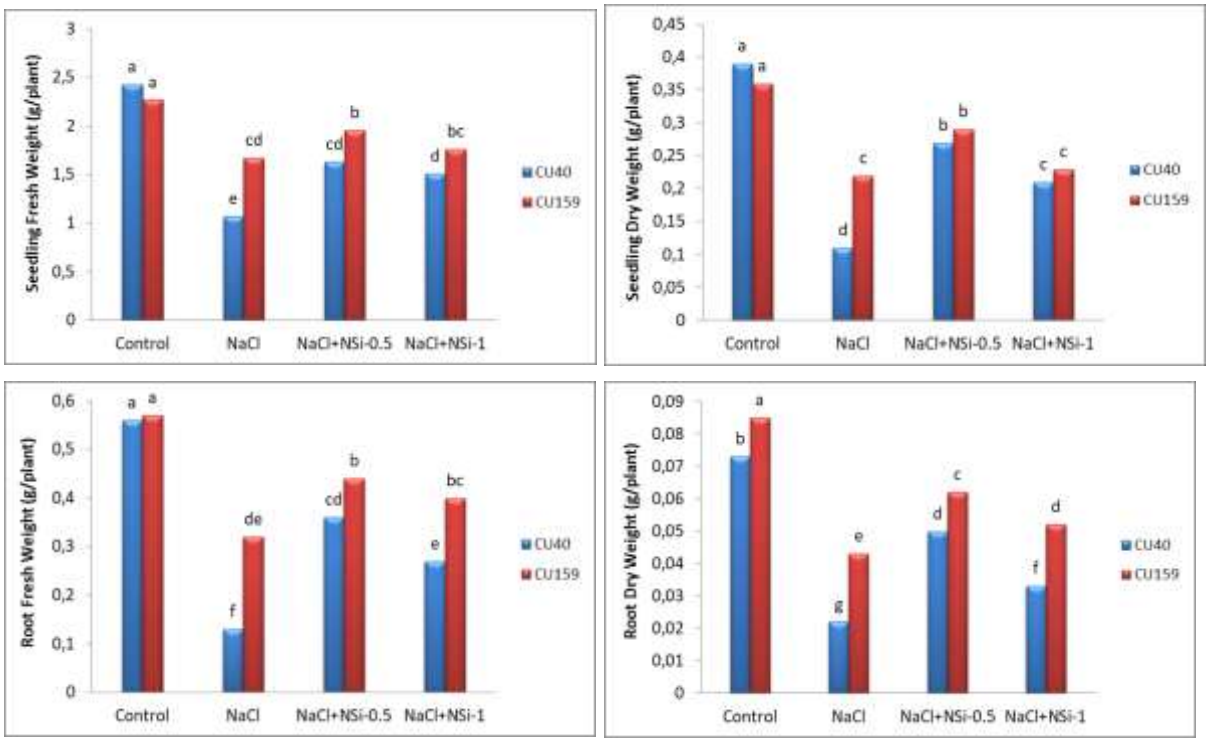

Figure 3. Effects of NSi application on seedling and root fresh and dry weights under salt stress condition

Salt stress reduces plant growth and yield mainly through two mechanisms: the osmotic stress it creates and the toxic effects of excessive ions. These ion imbalances disrupt cellular homeostasis and interfere with the physiological and biochemical processes occurring within the plant (Alsaeedi et al. 2018). Alsaeedi et al. (2018) reported that under salt stress conditions in cucumber, the application of NSi (0, 100, 200, and 300 ppm) enhanced germination parameters and vegetative growth, thereby effectively mitigating the detrimental effects of high Na^+ salinity. Five rates of NSi suspensions (0, 100, 200, 300 and 400 mg L^{-1}) were used to study their effects on seed germination and growth development of cucumber (*Cucumis sativus*). The rate of 200 mg L^{-1} significantly increased final germination%, germination speed, vigor index, and germination index by 28.7, 70.3, 46.7 and 68.8 %, respectively, compared to untreated seeds. However, it reduced the mean germination time by 31.7%. Similarly, 200 mg L^{-1} NSi had the highest fresh and dry weight of germinant. However, all NSi treatments enhanced the seed germination and growth development in comparison to control. Similarly, it was confirmed that the addition of NSi (1 mM SiO_2) improved lentil genotypes' germination and early seedling growth after exposure to 100 mM NaCl and stimulated immunity mechanisms against salt toxicity (Sabaghnia and Janmohammadi 2014).

CONCLUSION

Salt stress is considered one of the most critical abiotic factors adversely affecting seed germination, plant growth, and development. In this study conducted on melon, the application of 150 mM NaCl caused reductions in germination and growth parameters compared with the control plants, while germination time and emergence time increased under saline conditions. The application of NSi improved both germination and growth parameters and helped mitigate the reductions in germination and emergence rates caused by salt stress. These results suggest that NSi can be used as an eco-friendly strategy to improve seed germination and plant growth under salt stress conditions.

ÖZET

Toprak tuzluluğu, özellikle domates (*Solanum lycopersicum* L.) gibi sebze bitkilerinde büyüme, verim ve kaliteyi olumsuz etkileyen en önemli abiyotik stres faktörlerinden biridir. Bu çalışmada, nano silisyum (NS) uygulamalarının tuz stresi koşullarında yetiştirilen domates bitkilerinin morfolojik, fizyolojik, verim ve meyve kalite parametreleri üzerindeki etkileri araştırılmıştır. Bu amaçla kontrol bitkilerinde tuz düzeyi EC 1.5- 2 dSm^{-1} düzeyinde tutulurken, tuz stresi uygulaması gerçekleştirilen bitkilerde 5 dSm^{-1} düzeyinde tutulmuştur. Nano-Si (N-Si) uygulaması için; 0, 0.5, ve 1 mM olmak üzere 3 farklı konsantrasyon çalışmaya dahil edilmiştir. Stres uygulamasının başlamasından 63 gün sonra ölçüm ve analizler yapılmıştır. Tuz stresi, kontrol bitkilerine oranla bitki yaş ve kuru ağırlığı, gövde boyu, gövde çapı, klorofil içeriği (SPAD), meyve sayısı, meyve ağırlığı ve toplam verimde azalmalara neden olmuştur. Ancak özellikle 0.5 mM NSi uygulaması, bu olumsuz etkileri önemli ölçüde hafifletmiştir. NS uygulanan bitkilerde yaş ve kuru ağırlık, SPAD değeri ve verim parametrelerinde belirgin artışlar gözlenmiştir. Ayrıca NSi uygulamaları, suda çözünebilir kuru madde miktarı (SÇKM) ve Vitamin C içeriğini artırarak meyve kalitesini iyileştirmiştir. Sonuçlar, nano silisyumun tuz stresi koşullarında domatesin toleransını artırarak büyüme ve fizyolojik performansı desteklediğini ve meyve kalitesini koruduğunu göstermiştir.

EFFECTS OF NANO-SILICON APPLICATIONS ON GROWTH, YIELD, AND FRUIT QUALITY IN TOMATO (*Solanum lycopersicum* L.) UNDER SALT STRESS CONDITIONS

ABSTRACT

Soil salinity is one of the most critical abiotic stress factors that adversely affect plant growth, yield, and quality, particularly in vegetable crops such as tomato (*Solanum lycopersicum* L.). In this study, the effects of nano-silicon (NS) applications on the morphological, physiological, yield, and fruit quality parameters of tomato plants grown under salt stress conditions were investigated. For this purpose, the electrical conductivity (EC) of the nutrient solution was maintained at 1.5–2 dS m^{-1} in the control plants, while it was adjusted to 5 dS m^{-1} in salt-stressed plants. Nano-silicon was applied at three different concentrations: 0, 0.5, and 1 mM. Measurements and analyses were conducted 63 days after the initiation of stress treatments. Salt stress significantly reduced shoot fresh and dry weight, plant height, stem diameter, chlorophyll content (SPAD), fruit number, fruit weight, and total yield compared to the control plants. However, nano-silicon application, particularly at 0.5 mM, substantially mitigated these adverse effects. Plants treated with NS exhibited notable improvements in shoot biomass, SPAD values, and yield parameters. Moreover, NS treatments enhanced soluble solid content (TSS) and vitamin C levels, thereby improving fruit quality. The results demonstrated that nano-silicon enhances tomato tolerance to salinity by supporting growth and physiological performance while maintaining fruit quality under salt stress conditions.

Keywords: Abiotic Stress, Fruit Quality, Nano-Silicon, Salt Stress, Tomato, Yield

INTRODUCTION

One of the most significant agricultural consequences of climate change is the increasing prevalence of abiotic stress conditions that negatively affect crop production. Abiotic factors not only impair plant growth, yield, and product quality but also contribute to the proliferation of diseases and pests. Among abiotic stressors such as drought, extreme temperatures, flooding, and heavy metals, salt stress is considered one of the most problematic constraints in crop cultivation. Excessive soil salinity reduces the productivity of many agricultural crops and is particularly detrimental to vegetable production, where it can cause substantial yield losses (Atalan and Gökçe, 2021).

Salt stress negatively affects plants by inhibiting germination, growth and development, flowering, and fruit set. High sodium concentrations in saline soils restrict water uptake and nutrient absorption in plants. Water deficiency and nutrient imbalance lead to primary stress responses, including osmotic and ionic stress. These primary stresses subsequently result in oxidative stress, which may further trigger secondary stress responses. Salt stress induces various physiological and molecular alterations, and by limiting photosynthesis, it ultimately causes significant impairments in plant growth and development (Van Zelm et al., 2020; Gong, 2021).

Nanoparticles are small molecular particles ranging from 1 to 100 nm in size and are generally referred to as nanoscale particles (NSPs). They have wide applications in agriculture, including plant growth and development promoters, herbicides, nano-pesticides, and nano-fertilizers. The use of nano-fertilizers in small quantities contributes to fertilizer efficiency and helps reduce soil toxicity resulting from the accumulation of chemical fertilizers and pesticides. Additionally, under abiotic and biotic stress conditions, nanoparticles activate various physiological and biochemical mechanisms that enhance plant tolerance to stress (DeRosa et al., 2010; Siddiqui et al., 2015; Saxena et al., 2016).

Silicon is the second most abundant element in the Earth's crust (28%) after oxygen, and the most abundant element in soils (54%). Although silicon is known as a beneficial or semi-essential element due to its important roles in plants under stress, it does not meet the criteria for essentiality and lacks sufficient evidence confirming its direct involvement in plant metabolism; therefore, it is classified as a non-essential nutrient. Despite not being widely recognized as an essential nutrient, silicon is generally considered a "valuable element" or a "structural element" due to its positive effects on plant growth, physiological and metabolic pathways, cellular structure, and its ability to alleviate a wide range of abiotic and biotic stresses. Numerous studies have confirmed its role in enhancing plant growth, development, and yield under abiotic stress conditions such as salinity, heavy metal toxicity, and drought across various plant species (El-Ramady et al., 2022).

In terms of both production volume and species diversity, the majority of vegetables grown in Türkiye belong to the Solanaceae family. Tomato, which holds substantial global and national importance, is cultivated over large areas and represents one of the most significant vegetable crops used both fresh and for processing. In the present study, the effects of nano-silicon (NS) application on plant growth and fruit quality parameters of tomato were investigated under salt stress conditions (5 dS/m).

MATERIAL AND METHOD

In this study, the tomato cultivar *Android* was used as plant material. Seedlings were transplanted into 24-liter plastic pots filled with a peat:perlite mixture (2:1), with three plants per pot. Plants were irrigated with a standard nutrient solution, and irrigation was managed

based on the ratio of "drainage solution/applied solution" as described by Schröder and Lieth (2002). Drainage levels were monitored daily, and this ratio was maintained at approximately 30% throughout the experiment depending on plant growth.

Salt stress treatments were initiated when plants reached the flowering stage. For this purpose, the electrical conductivity (EC) of the nutrient solution was maintained at 1.5–2 dS m^{-1} for control plants, while it was adjusted to 5 dS m^{-1} for salt-stressed plants using NaCl to achieve the target EC level. For the nano-silicon (NS) treatments, three concentrations 0, 0.5 ($NS_{0.5}$), and 1 (NS_1) mM were included in the experiment. Control plants continued to receive only the standard nutrient solution.

Sixty-three days after the initiation of salt stress, plants were harvested and evaluated for morphological traits (fresh and dry weight, stem diameter, plant height, SPAD readings), yield components, and fruit quality parameters (fruit number, fruit weight, fruit dry matter content, juice pH and EC, titratable acidity, soluble solids content, and vitamin C content).

A randomized complete block factorial design was used in the study. The numerical data obtained were subjected to analysis of variance (ANOVA) using the JMP statistical software package (version 13.0, SAS Institute Inc., USA). Differences among treatments were determined using the Least Significant Difference (LSD) test at the $p < 0.05$ significance level, and statistical groupings were indicated by lettering.

RESULTS AND DISCUSSION

In the study investigating the effectiveness of NS application under salt stress conditions, shoot fresh and dry weights were measured and are presented in Table 1. The highest shoot fresh and dry weight values were recorded in the control plants (2140 and 757.75 g $plant^{-1}$, respectively). Under salt stress, shoot biomass decreased by 44–72% compared with the control. With the $NS_{0.5}$ treatment, this reduction was limited to 12–15%, while in the NS_1 treatment it remained within 22–29%.

The effects of salt and NS treatments on plant height and stem diameter are also shown in Table 1. The greatest plant height and stem diameter were obtained in the control plants, with 248 cm $plant^{-1}$ and 21.83 mm $plant^{-1}$, respectively. Under salt stress, plant height and stem diameter decreased by 37–49%, whereas with $NS_{0.5}$ these reductions were limited to 12–13%, and to 16–20% with NS_1.

SPAD values decreased by 45% under salt stress relative to the control, while the decrease was only 7% in the $NS_{0.5}$ treatment and 15% in the NS_1 treatment. When comparing salt-stressed plants with those receiving NS treatments, an improvement of 54–70% in SPAD readings was observed (Table 1).

Table 1. The effects of NS application on growth parameters under salt stress

	Shoot Fresh Weight (g/plant)	Shoot Dry Weight (g/plant)	Plant Height (cm/plant)	Stem Diameter (mm/plant)	SPAD
C	2140.00 a	757.75 a	248.00 a	21.83 a	60.55 a
S	1181.00 c	211.47 c	155.33 b	12.51 c	33.24 c
S+$NS_{0.5}$	1882.33 b	640,66 b	219.00 a	19.22 ab	56.59 ab
S+NS_1	1678.33 b	541.43 b	209,33 a	17.43 b	51.47 b

* Means shown with different letters are statistically different within 5% error limits according to the LSD test.

In the study, yield and quality parameters were also evaluated. The highest yield per plant was obtained in the control treatment with 4.48 kg m^{-2}, whereas yield decreased to 1.43 kg m^{-2} under salt stress, 3.16 kg m^{-2} with the $NS_{0.5}$ treatment, and 2.80 kg m^{-2} with the NS1 treatment. Salt stress caused a 68% reduction in yield compared with the control, while this reduction was limited to 30% with $NS_{0.5}$ and 38% with NS_1 (Figure 1). The highest values for fruit number (315.4 fruits $plant^{-1}$), fruit weight (225.26 g), and fruit dry weight (16.06 g) were also recorded in the control treatment. All of these parameters decreased under salt stress compared with the control plants. The reductions were 60% for fruit number, 55% for fruit weight, and 73% for fruit dry weight. Under salt stress, the $NS_{0.5}$ treatment resulted in only 13–31% reductions in fruit number, fruit weight, and fruit dry weight relative to the control, while in the NS_1 treatment these reductions ranged from 17% to 38%. Overall, NS applications yielded improvements ranging from 76% to 159% compared with salt-stressed plants without NS treatment, with $NS_{0.5}$ emerging as the most effective concentration (Figure 1).

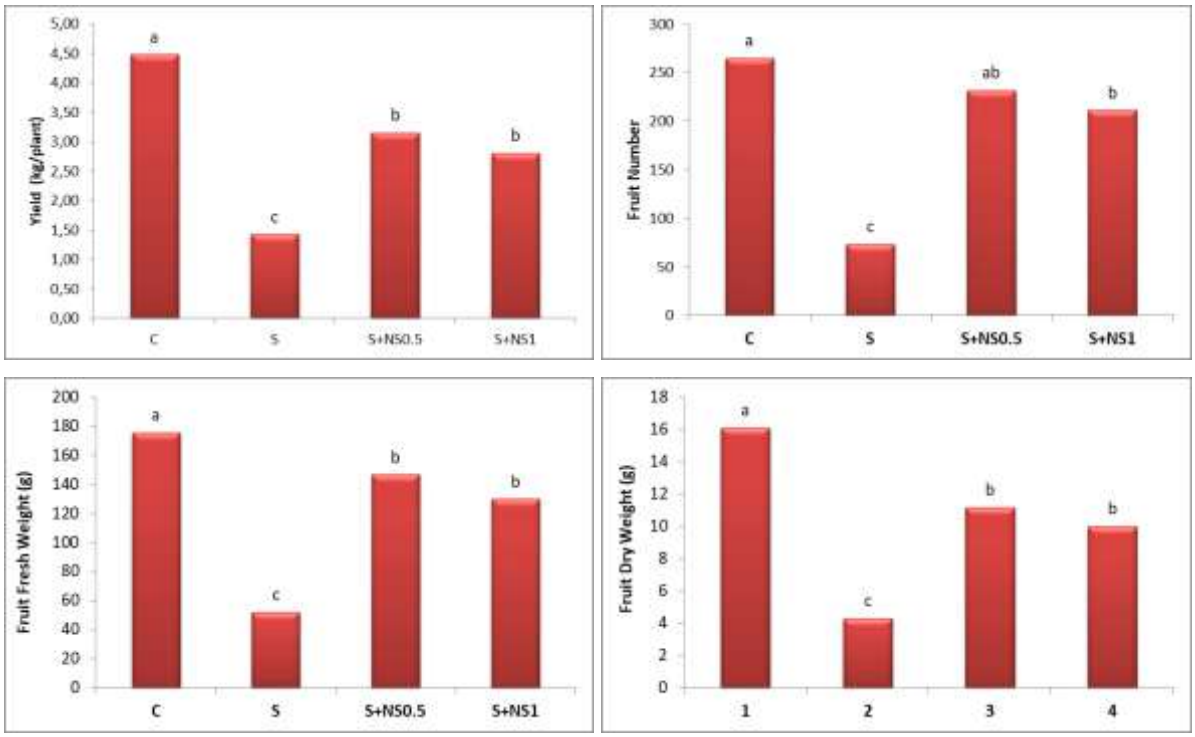

Figure 1. The effects of NS application on yield, fruit number, fresh weight, and dry weight

The effects of salt and NS treatments on soluble solid content (SSC), fruit juice pH, EC, titratable acidity, and vitamin C content were also examined, and the results are presented in Table 3. Accordingly, SSC and vitamin C content increased by 49–117% under salt stress, with the highest values observed in the $NS_{0.5}$ treatment. Regarding fruit juice pH, EC, and acidity, pH decreased by 3–7%, whereas EC and acidity increased by 19–58%. However, the differences among treatments for these parameters were not statistically significant (Figure 2).

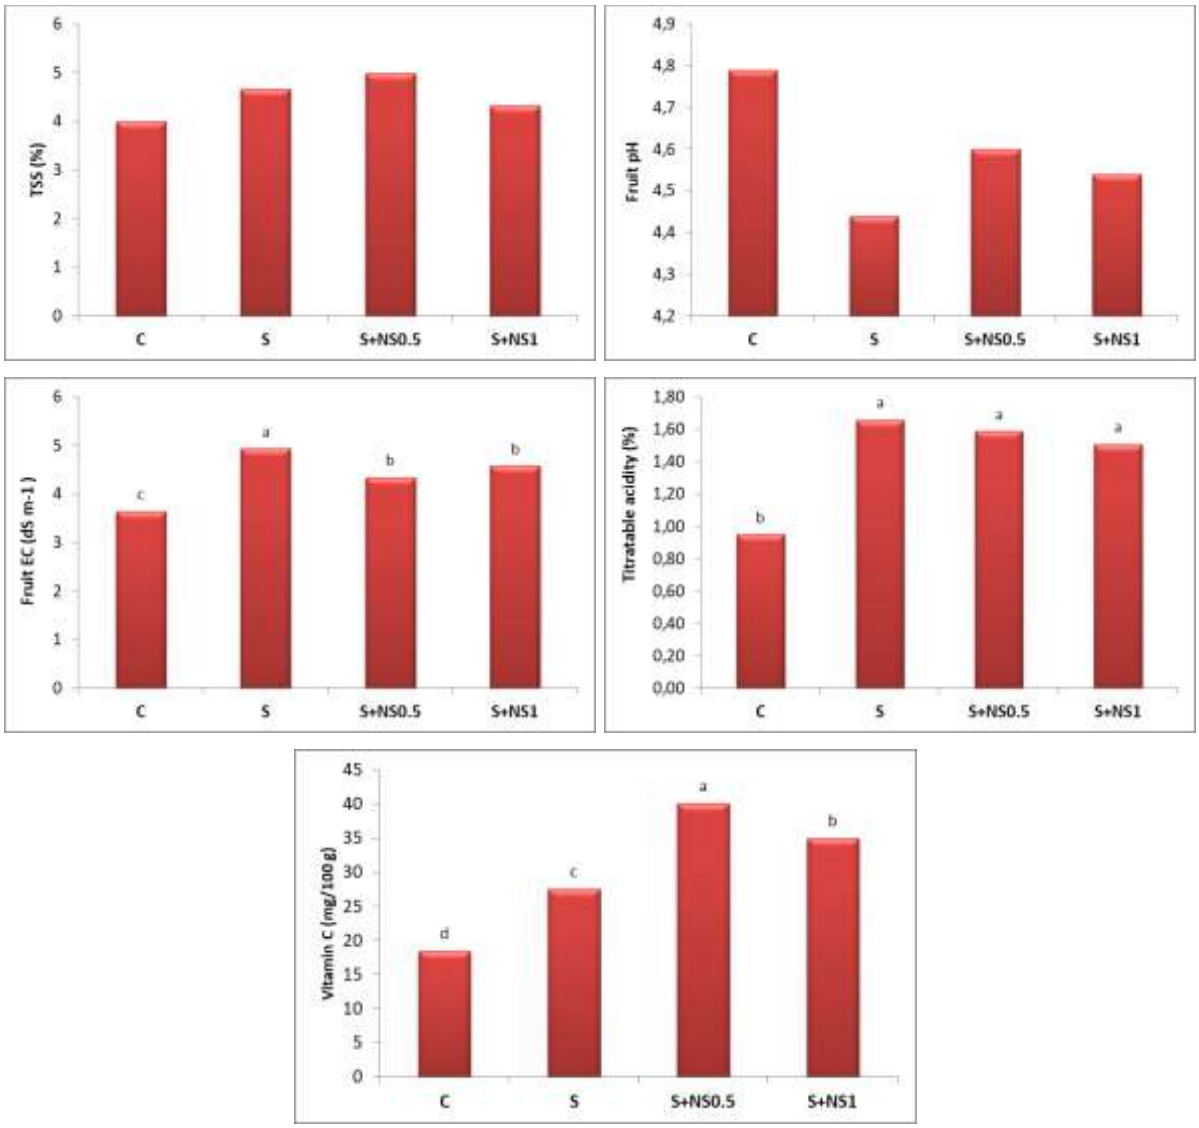

Figure 2. The effects of NS application on fruit soluble solid content (SSC), fruit juice pH, EC, titratable acidity, and vitamin C content

Salt stress adversely affects plant growth and development in parallel with the increasing levels of NaCl and other soluble salts in the soil. As the concentration of salts in the soil solution increases and water potential decreases, the osmotic potential of plant cells is reduced. Consequently, depending on the severity and duration of the salt stress, numerous biological processes including growth, development, germination, cell division, and photosynthesis are negatively affected (Bressan et al., 2008). Salt stress leads to reductions in root and shoot length primarily due to cellular dehydration and subsequent impairments in cell elongation and division (Balasubramaniam et al., 2023). Exposure to salinity also reduces leaf number and leaf area, which in turn results in decreases in fresh and dry biomass (Acosta-Motos et al., 2017). Excessive sodium (Na) accumulation in the soil leads to increased Na^+ uptake and accumulation in plant tissues, disrupting membrane potential and promoting chloride (Cl^-) uptake through electrochemical gradients. Elevated Na^+ concentrations cause osmotic imbalance, membrane damage, and excessive production of reactive oxygen species (ROS), all of which have detrimental effects on various metabolic activities and essential enzymes. As a result, both cell division and cell elongation are adversely affected. Similarly, high Cl^- levels reduce chlorophyll content and damage membrane systems and organelle structures, ultimately

suppressing plant growth (Munns and Tester, 2008; Hao et al., 2021). In the present study, salt stress caused reductions in growth parameters including fresh and dry weight, stem height, and stem diameter ranging from 13% to 72% compared with the control plants. The application of NS substantially mitigated the adverse effects of salt stress, resulting in improvements of 34–156% across these growth parameters. Supporting these findings, Ahmadian et al. (2021) reported that in wheat, salt stress reduced turgor pressure and protoplasmic hydration, leading to declines in photosynthesis and consequently in plant growth and development; however, nano-silicon application enhanced growth parameters under stress conditions. Similarly, Deskoy et al. (2021) noted that NS increased turgor pressure, thereby enhancing water uptake and nutrient acquisition, and ultimately promoting plant growth and development.

Stress conditions lead to chloroplast degradation, destabilization of pigment–protein complexes, chlorophyll loss, and alterations in the quantity and composition of carotenoids (Bayram et al., 2021). Silicon applications have been reported to considerably enhance plant growth and development by increasing total photosynthetic pigment content, photosynthetic rate, chlorophyll concentration, stomatal conductance, transpiration, and intercellular CO_2 concentration (Ndiso et al., 2016; Yaghubi et al., 2016; Avestan et al., 2019). In the present study, salt stress reduced SPAD values by 45% in tomato; however, this reduction was limited to only 6% and 15% in the NS treatments. When compared with salt-stressed plants without NS, improvements of 70% and 54% were achieved, respectively.

Oliveira et al. (2021) reported that under salt stress conditions, increasing salt concentration restricts water and nutrient uptake, resulting in yield losses. In their study on melon, fruit weight, fruit diameter, and yield per plant decreased under different salinity levels (2.5, 5.0, 6.5, and 7.5 dS m^{-1}). Similarly, elevated NaCl concentrations reduced fruit number, fruit weight, and total yield per plant in cucumber, with salt stress at 4 dS m^{-1} causing approximately 60% and 65% reductions in fruit number and total yield, respectively (Brengi et al., 2022). In the present study, NS application resulted in a 27–159% improvement in yield and quality parameters. In a study evaluating plant growth, development, and yield in pepper, salt stress reduced plant growth parameters, total chlorophyll content, fruit number, fruit length, fruit diameter, fruit volume, fruit dry weight, and overall yield, while increasing plant proline and free amino acid content, fruit ascorbic acid, total sugars, total phenolic and flavonoids, and soluble solids (Mostafa et al., 2024). The authors attributed the yield enhancement to improved nutrient uptake and increased photosynthetic activity in leaves due to NS application. Consistent with these findings, studies conducted on tomato (Ebrahimi et al., 2024) and cherry tomato (Islam et al., 2018) reported that NS application significantly improved yield and quality parameters.

CONCLUSION

The results of the study demonstrated that salt-induced drought stress exerted detrimental effects on the morphological, physiological, yield, and quality parameters of tomato. Nano-silicon applications were effective in mitigating the adverse effects of salinity to varying degrees across the evaluated parameters, with the 0.5 mM NS treatment showing the most pronounced positive impact.

ÖZET

Bu çalışmada turboşarj sistemlerinde kullanılan radyal kompresörün ön tasarım metodolojisi ele alınmıştır. İçten yanmalı motorların güç ve verimlilik artışında önemli rol oynayan turboşarj sistemlerinin en kritik bileşeni kompresör çarkıdır ve çark tasarımı, basınç oranı ve izentropik verim gibi performans parametrelerini doğrudan etkilemektedir. Bu nedenle çark tasarımına yönelik doğru bir metodoloji geliştirilmesi, motor performansını artırmak açısından büyük önem taşımaktadır. Bu kapsamda, literatürde yer alan temel prensipler dikkate alınarak tasarım süreci için sistematik bir yaklaşım benimsenmiştir. İlk aşamada kompresörün servis koşulları ve hedeflenen performans isterleri tasarım girdileri olarak tanımlanmış, ardından bu girdilerden hareketle hız üçgenleri ve akışa ilişkin termodinamik parametreler hesaplanmıştır. Hesaplamalarda akışkanlar mekaniği ve termodinamiğin temel denklemleri (süreklilik, momentum, enerji korunumu ve hal denklemleri) ile birlikte izentropik süreçlerde basınç, sıcaklık ve hız arasındaki ilişkiler ve ideal gaz bağıntıları esas alınmıştır. Bu değerler doğrultusunda kanat profili tasarımı için gerekli büyüklükler belirlenmiş ve ön tasarım oluşturulmuştur. Geometri, ANSYS Workbench yazılımındaki Vista CCD modülü kullanılarak hazırlanmış, ardından BladeGen modülünde üç boyutlu çark modeli elde edilmiştir. Bu yaklaşım, hesaplanan parametrelerin geometrik modele doğru bir şekilde aktarılmasını sağlamış, aynı zamanda tasarım üzerinde kolay değişiklik yapılmasına ve farklı konfigürasyonların denenmesine imkân vermiştir. Sonuç olarak, belirlenen performans kriterlerine uygun ve optimize edilebilir bir radyal kompresör geometrisi elde edilmiştir.

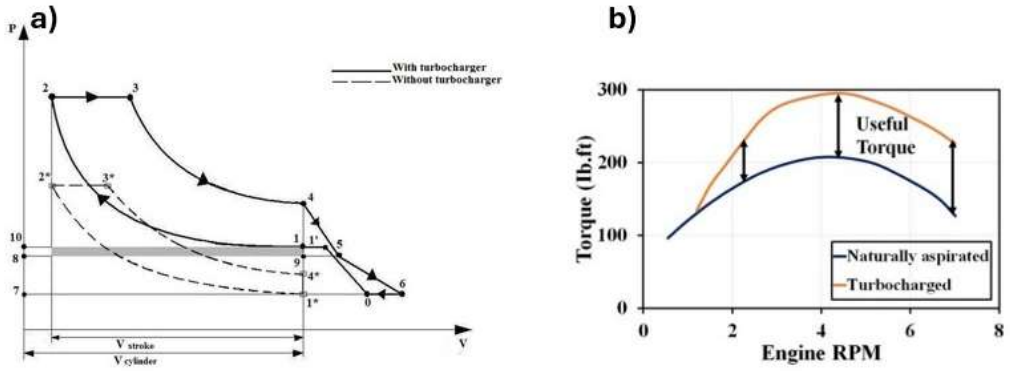
TURBOCHARGER SYSTEM RADIAL COMPRESSOR IMPELLER DESIGN

ABSTRACT

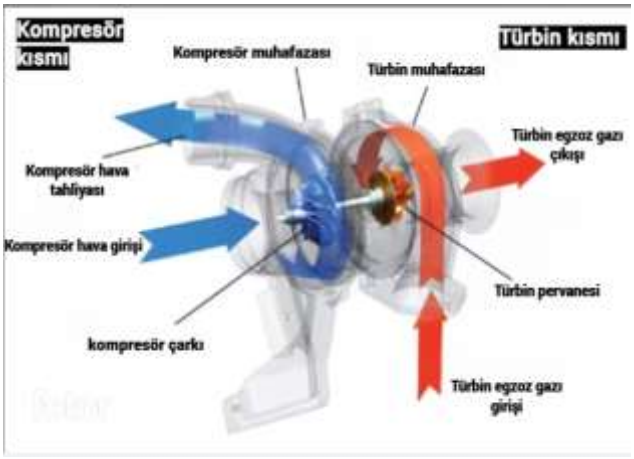
This study considers the preliminary design methodology for the radial compressor used in turbocharger systems. The compressor impeller, a critical component that plays a significant role in increasing power and efficiency in internal combustion engines, directly influences performance parameters such as pressure ratio and isentropic efficiency through its design. Therefore, proper methodology of the impeller design is crucial for enhancing the engine performance. In this context, a systematic approach was adopted for the design process, taking into account the basic principles in the literature. In the first stage, the compressor's service conditions and targeted performance specifications were defined as design inputs. Then, from these inputs, velocity triangles and the thermodynamic parameters which is related to the flow were calculated. The calculations were performed based on the fundamental equations of fluid mechanics and thermodynamics (continuity, momentum, energy conservation, and equations of state), taking into account the relationships between pressure, temperature, and speed in isentropic processes and ideal gas relations. Necessary blade dimensions to design the blade profile are determined according to these calculated values. Then the preliminary impeller design is obtained. The geometry is created using the Vista CCD module in ANSYS Workbench, followed by a three-dimensional impeller model generated in the BladeGen module. This approach ensured the accurate conversion of calculated parameters to the geometric model, while also allowing for easy design modifications and testing of different configurations. As a result, a radial compressor geometry that meets the desired performance criteria and suitable for optimized was achieved.



Keywords: Turbocharger, Radial Compressor, Impeller Design, Preliminary Design, Turbomachinery, Fluid Mechanics

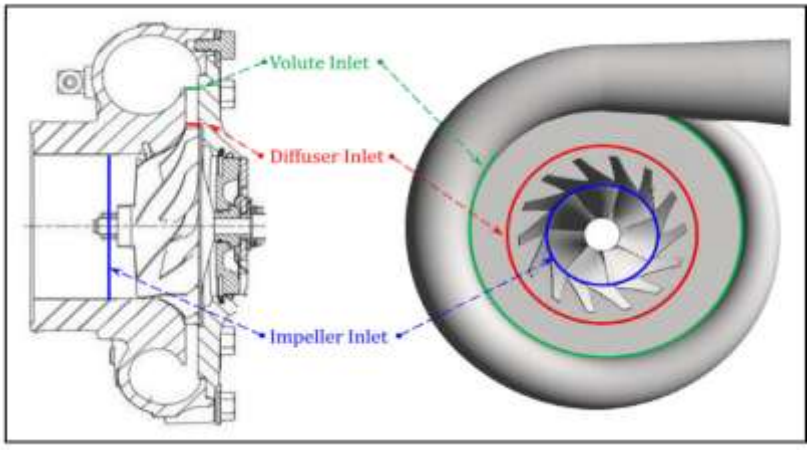
1. GİRİŞ

Dünyada iş akışkanı olarak havayla çalışan bir motorun gücünü artırmak amacı üzerinde düşünüldüğünde başta otomobil olmak üzere diğer motor üreten sektörlerde akla ilk gelen yöntemlerden biri motora daha fazla oksijen dolayısıyla hava göndermek olmuştur. Bu işlevi yerine getirme kabiliyetine sahip olan sistemlerden biri turboşarj sistemleridir [1,2]. Her ne kadar günümüzde elektrikli motorlar turboşarj sisteminin kullanıldığı motorların yerini almaya başladıysa da dünyadaki fosil enerji kaynaklarının miktarının yenilenebilir enerji miktarından fazlalığı düşünüldüğünde elektrifikasyona geçiş sadece başlangıç aşamasında kalmakta ve mecburi olarak uzun yıllar boyunca yanma reaksiyonlu dolayısıyla turboşarj sistemli motorlar kullanılacağı uzmanlar tarafından öngörülmektedir [3,4]. Ayrıca gelecekte yaygınlaşacağı düşünülen hidrojen yakıtlı motorlarda da turboşarj sisteminin kullanılabileceği öngörülmektedir [5]. Bu sebeplerden dolayı günümüzde hala turboşarj sistemlerinin geliştirilmesi için şirketler yatırımlar yapmakta ve AR-GE çalışmalarını sürdürmektedirler. Şirketler bu çalışmalarını ticari bir sır olarak sakladıkları için turboşarj tasarımları hakkındaki bilgimiz literatürdeki az sayıda araştırma ile sınırlıdır. Bu araştırmaların çoğunluğu turboşarj sistemlerindeki çeşitli parçaların sonlu hacimler analizleri ile optimizasyonlarını içermektedir [6,7]. Bu bildiride de turboşarj sistemi incelenmiş ve bu sistemdeki en önemli parçalardan biri olan radyal kompresörün ön tasarım metodolojisi anlatılmıştır.



İçten yanmalı motorların verimini artırmak için kullanılan yöntemler arasında silindir hacmini büyütmek, strok boyunu artırmak, devir sayısını yükseltmek, silindir sayısını artırmak ve ortalama indike basıncı yükseltmek sayılabilir. Bu yöntemlerin birçoğu motorun yapısal özelliklerine bağlı olduğundan her zaman uygulanabilir değildir. Turboşarj sistemi ise bu yollar içinde ortalama indike basıncı artırarak motorun daha yüksek güç ve verim elde etmesini sağlar. İndike basınç artarsa elde edilecek iş dolayısıyla motor gücüde artacaktır. Basıncı artırmak için motor konstrüksiyonunda herhangi bir parametreyi değiştirmek gerekmez bunun için motora uygun turboşarj sistemi eklenmesi yeterlidir [2].

Turboşarj, motora basınçlı ve soğutulmuş hava göndererek silindir başına giren hava kütlesini artırır. Bu, yanma sırasında daha yüksek basınç üretir. Yanma basınç eğrisinin ortalaması olan indike basınç yükseldiği için motorun indike gücü artar. Şekil 1a'da bir dizel motorun P–V diyagramında turboşarj sisteminin etkisi görülmektedir [8]. Diyagramda çevrimin kapalı alanı işi temsil ettiğinden, turboşarjlı durumda alanın büyümesi motorun ürettiği işin arttığını ve dolayısıyla turboşarj sisteminin motor gücünü artırmadaki etkisini açıkça ortaya koymaktadır. Şekil 1b'de görüldüğü üzere turboşarjlı motor, doğal emişli motora göre daha yüksek tork üretmektedir [9]. Özellikle düşük ve orta devirlerde belirginleşen bu fark, silindire daha fazla hava ve yakıt gönderilmesiyle yanma veriminin artmasından kaynaklanmaktadır. Böylece motorun hem torku hem de güç eğrisi daha geniş bir devir aralığında yüksek seviyede kalmakta, bu da turboşarj sisteminin performans üzerindeki etkisini açıkça göstermektedir.



Şekil 1. a) Turboşarj sisteminin bir dizel motorun termodinamik çevrimi üzerindeki etkisi [8].
b) Turboşarj sisteminin doğal emişli motorlara göre sağladığı tork artışı [9].

Turboşarj sistemi temelde üç ana bölümden oluşur: egzoz enerjisini işe çeviren türbin, havayı basınçlandıran kompresör ve ikisini bağlayan merkez bölüm (şaft, yataklama, yağlama) (Şekil 2). Bu yüzden kompresör ve türbinin verimleri turboşarjın performansını belirler.

Şekil 2. Turboşarj sisteminin kısımları ve işleyişi [10].

Radyal kompresörde akışkan, çarkta hız kazanarak kinetik enerjiye dönüşür; difüzör ve volütte ise bu hız azalırken kinetik enerji statik basınca çevrilir (Bu kısımlar şekil 3 'te gösterilmiştir.). Böylece girişten çıkışa doğru akışkanın enerjisi düzenli şekilde basınç artışına dönüştürülür.

Şekil 3. Kompresörün çark, difüzör ve sarmal kısımların girişleri [11].

Turboşarj sistemindeki kompresörün kısmının en önemli parçası çark kısmıdır. Bu çarkın tasarımı, basınç oranı ve izentropik verim olmak üzere kompresörün genel performans karakteristiklerini doğrudan etkiler. Bu yüzden kompresörden istenilen etkiyi almak için çark tasarımı büyük bir önem arz etmektedir.

Literatürde kompresör çarkının tasarımı ile alakalı çalışmalar incelendiğinde Kong vd. [7] çalışmalarında santrifüj kompresör çarkları için bir tasarım metodolojisi sunmuştur. Chun vd. [12] yaptığı çalışmada, egzoz gazlarıyla çalışan bir Wärtsilä 20V34SG motoru için off-design turboşarj modellemesi geliştirilmiştir. Çalışmada önce GT-Power yazılımında 1D motor modeli oluşturulmuş, ardından turboşarj modeli EES yazılımında kalibre edilmiştir. Bourabia vd. [6] çalışmalarında, santrifüj kompresörler için 1D mean-line model ile kayıp modellerini evrimsel optimizasyon teknikleri (GA, NSGA-II) ile birleştirerek ön tasarım optimizasyonu gerçekleştirmiş, böylece farklı performans hedeflerini aynı anda karşılayan hızlı ve otomatik bir tasarım yaklaşımı önermişlerdir. Bu yönüyle, klasik 1D ön tasarıma dayalı yöntemlerden ayrılmaktadır. Xu ve Amano [13] çalışmalarında, motor verimliliğini artırmak amacıyla turboşarjın kompresör ve türbinini birlikte ele alan bütünleşik bir tasarım yaklaşımı geliştirmişlerdir.

Bu çalışmada ise literatürde sunulan farklı yaklaşımlardan faydalanılarak, özellikle turboşarj kompresör çarkının ön tasarım metodolojisi üzerine odaklanılmıştır. Bu çalışmada, temel termodinamik ve akışkanlar mekaniği denklemleri üzerinden sistematik bir ön tasarım yaklaşımı izlenmiş, hız üçgenleri ve performans parametreleri esas alınarak bir turboşarj kompresör çarkı için hesaplamalar gerçekleştirilmiştir.

2. MATERYAL VE YÖNTEM

Radyal kompresörler oldukça karmaşık geometrik özelliklere sahip olup, parametrelerin farklı kombinasyonları milyonlarca olasılık ortaya çıkarabilmektedir. Bu nedenle tasarım sürecinde izlenecek adımların önceden belirlenmesi, yani sistematik bir algoritmanın oluşturulması gereklidir. İlk aşamada turboşarj kompresörleri için genel karakteristik değerler belirlenir; tasarımdan beklenen isterler ile kompresörün çalışacağı servis koşulları netleştirilmelidir. Ardından hedeflenen sıkıştırma oranı ve verimlilik değerleri doğrultusunda teorik bir hesaplama yapılır. Bu hesaplamalar neticesinde bazı parametrelere ait değerler elde edilmektedir. Elde edilen bu değerler kullanılarak ANSYS programındaki modüllerle çark geometrisi elde edilmiş olur.

Başlangıçtaki kanat profili oluşturulmadan önce giriş ve çıkış bölgelerindeki hız üçgenlerinin belirlenmesi gerekmektedir. Hız üçgenlerinden elde edilen bağıntılar, akışkanlar mekaniği ve termodinamiğin temel yasaları ile birlikte kullanılarak çark tasarımına ulaşılmaktadır. Gaz akışının hâkim olduğu bu tür sistemlerde süreklilik denklemi, enerjinin korunumu, momentum denklemleri ve gazların hâl ilişkileri hesaplamaların temelini oluşturmaktadır. Ayrıca, izantropik süreçlerde basınç, sıcaklık ve hız arasındaki ilişkiler, ideal gaz denklemi ve sıkıştırılabilirlik faktörü gibi bağıntılar da tasarım sürecinde önemli rol oynamaktadır.

Bu çalışmada, kompresör tasarımına yönelik hesaplamalarda kullanılan denklemler 1'den 25'e kadar verilmiştir:

$$\frac{T_0}{T_s} = 1 + \frac{\gamma-1}{2} M^2 \quad (1)$$

$$\frac{T_0}{T_s} = \left(\frac{P_0}{P_s}\right)^{\frac{\gamma-1}{\gamma}} \quad (2)$$

$$\frac{P_0}{P_s} = \left(1 + \frac{\gamma-1}{2} M^2\right)^{\frac{\gamma}{\gamma-1}} \quad (3)$$

$$H_{ad} = C_p(T_{02} - T_{01}) = C_p \left[\left(\frac{P_{02}}{P_{01}}\right)^{\frac{\gamma-1}{\gamma}} - 1\right] = \frac{\gamma R T_{01}}{\gamma-1}\left[\left(\frac{P_{02}}{P_{01}}\right)^{\frac{\gamma-1}{\gamma}} - 1\right] \quad (4)$$

$$\frac{\dot{m}}{A} = \sqrt{\frac{\gamma}{R}} \frac{P}{\sqrt{T}} \frac{M}{\left(1+\frac{\gamma-1}{2}M^2\right)^{\frac{\gamma+1}{2(\gamma-1)}}} \quad (5)$$

$$T_0 = T_s + \frac{V^2}{2C_p} \quad (6)$$

$$P_0 = P_s + \rho \frac{V^2}{2g} \quad (7)$$

$$V_1^2 = V_{\theta 1}^2 + V_{m1}^2 \quad (8)$$

$$V_2^2 = V_{\theta 2}^2 + V_{m2}^2 \quad (9)$$

$$W_1^2 = (U_1 - V_{\theta 1})^2 + V_{m1} \quad (10)$$

$$W_2^2 = (U_2 - V_{\theta 2})^2 + V_{m2} \quad (11)$$

$$W = \sqrt{(V_\theta - U)^2 + V_m^2} \quad (12)$$

$$U = 2\pi r N \quad (13)$$

$$i = \beta_b - \beta \quad (14)$$

$$V_{\theta 2} = U_2 + V_{m2} \tan \beta_{2b} - V_{slip} \quad (15)$$

$$V_{slip} = U_2(1 - \sigma) \quad (16)$$

$$\eta_{rotor} = \frac{PR^{\frac{\gamma-1}{\gamma}} - 1}{TR - 1} \quad (17)$$

$$\sigma = \frac{V_{\theta 2}}{U_2} \quad (18)$$

$$\sigma' = 1 - \frac{0{,}855\pi^2}{z_s} \frac{V_{m2}}{U_2} \quad (19)$$

$$1 - \sigma = \frac{V_{\theta 2}}{U_2}\left(\frac{1}{\sigma'} - 1\right) \quad (20)$$

$$\frac{\sigma'}{1-\sigma'} = \frac{\frac{V_{m2}}{U_2}\tan \beta_2 + \sigma}{1-\sigma} \quad (21)$$

$$\mu = \sigma \frac{\lambda}{\lambda - \tan \beta_2} \quad (22)$$

$$\lambda = \frac{V_{\theta 2}}{V_{m2}} = \text{Döngü parametresi} \quad (23)$$

$$H_{ad} = \frac{1}{2g}[(V_1^2 - V_2^2) + (U_1^2 - U_2^2) + (W_1^2 - W_2^2)] \quad (24)$$

$$\frac{P_{02}}{P_{01}} = \left[\frac{\gamma-1}{\gamma R T_{01}}(U_1 V_{\theta 1} - U_2 V_{\theta 2}) + 1\right]^{\frac{\gamma}{\gamma-1}} \quad (25)$$

Bu denklemler ile geometrinin oluşturulması için gerekli değerlerin hesaplamasına geçilmeden önce bazı tasarım girdileri belirlenmelidir. Bu girdiler radyal kompresörün kullanılacağı yer ve servis şartlarına göre değişmektedir. Bu çalışma için kullanılan parametreler Tablo 1'de verilmiştir.

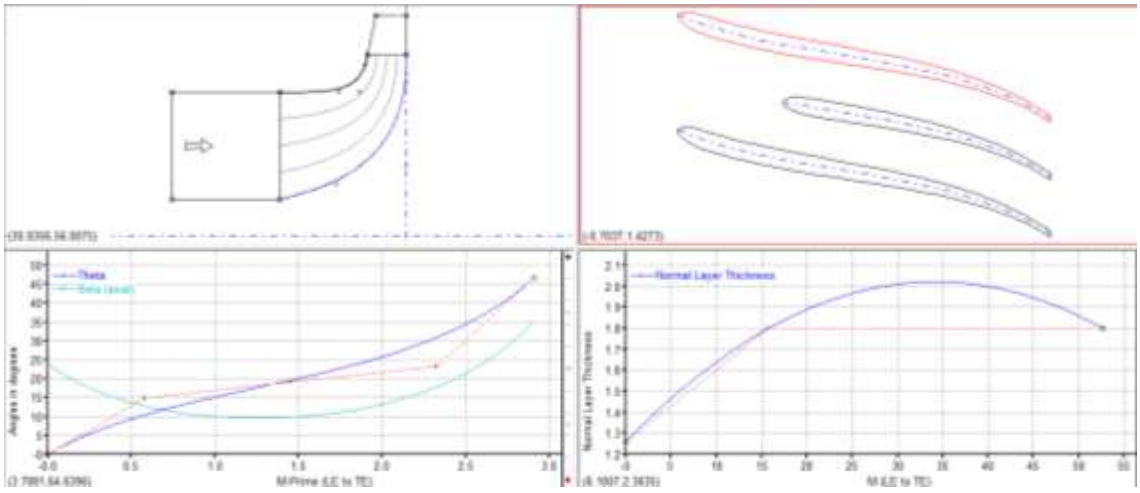
Tablo 1. Tasarım girdileri ve gereksinimleri

Parametre	Değer
Devir Sayısı	1600 dev/s
Giriş Toplam Basıncı	101325 Pa
Giriş Toplam Sıcaklığı	288,15 K
Ana Kanat Sayısı (main blade)	7
Ayırıcı kanat sayısı (splitter blade)	7
Göbek Çapı	0,018 m
Uç Çapı	0,071 m
Çıkış çapı	0,088m
Çark Çıkışı Kanat Genişliği	0,00774m
Kütlesel Debi	0,65 ± 0,01 kg/s
Toplam Basınç Oranı	3 ± 0,05
İzentropik Verim	≥ 0,85

Belirlenen parametreler ile hesaplamalara geçilmiştir. Hesaplamalar neticesinde elde edilen parametreler giriş ve çıkış koşullarına göre Tablo 2'de gösterilmiştir.

Tablo 2. Hesaplanan giriş ve çıkış değerleri

Parametre	Giriş	Çıkış
P	86,459 kPa	184,358 kPa
P_0	101,235 kPa	303,975 kPa
T	275,26 K	358,15 K
T_0	288,15 K	413,15 K
ρ	1,09 kg/m^3	1,76 kg/m^3
V_m	160,95 m/s	172,87 m/s
V	160,95 m/s	332,5 m/s
M	0,483	0,88

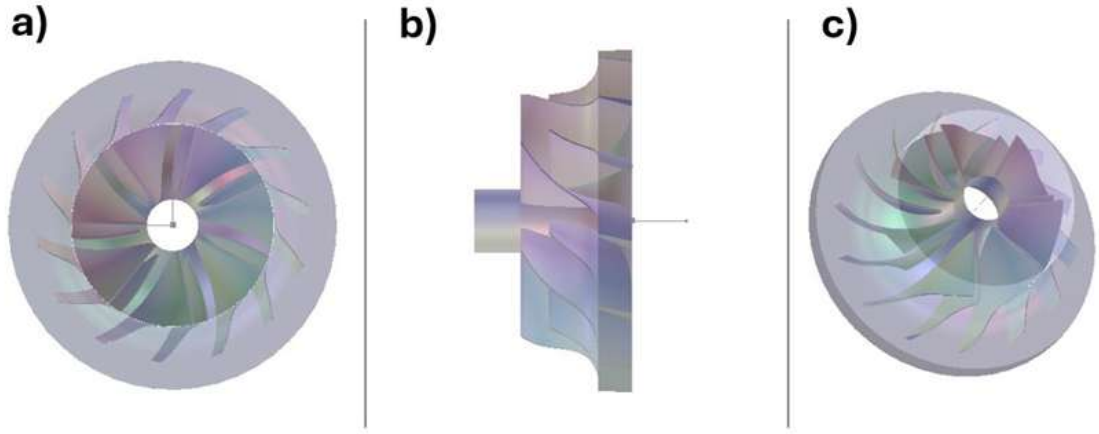


Hesaplamalar neticesinde elde edilen kanat açışı, verimlilik ve hız üçgenlerine ait parametreler Tablo 3'te gösterilmiştir.

Tablo 3. Hesaplamalar neticesinde elde edilen çark hız, açı ve verimlilik değerleri

Parametre	Değeri
U_{1t}	356,885 m/s
U_{1h}	90,478m/s
W_h	184,64 m/s
W_t	391,499 m/s
β_{1h}	29,34°
β_{1t}	65,72°
U_2	442,336 m/s
β_2	−21,207°
η_{rotor}	0,85

3. BULGULAR



Belirlenen bu değerler kullanılarak öncelikle Vista CCD modülü aracılığıyla bir ön tasarım oluşturulmuş, ardından bu tasarım BladeGen modülüne aktarılmıştır.

Şekil 4. ANSYS BladeGen 2D bıçak profili ve tasarım grafikleri

ANSYS BladeGen modülü, hesaplanan değerler doğrultusunda geometriyi hızlı ve doğru bir şekilde oluşturmaya olanak sağlamakta, ayrıca tasarım üzerinde kolayca değişiklik yaparak farklı varyasyonların denenmesine imkan vermektedir. ANSYS BladeGen modülünde hesaplamalar neticesinde elde edilen ilk tasarım parametreleri şekil 4'te grafikler halinde gösterilmektedir. Bu arayüzü üzerinden çark bıçak kalınlıkları ve açıları, CFX analizleri yapılarak elde edilen sonuçlara göre kolaylıklar değiştirilebilir/optimize edilebilir.

BladeGen ortamında üç boyutlu olarak elde edilen çark geometrisi şekil 5'te verilmiştir.

Şekil 5. Elde edilen radyal kompresör çark modeli

4. TARTIŞMA

Bu çalışmada elde edilen sonuçlar, literatürde yer alan benzer çalışmalar ile karşılaştırıldığında uyumlu bir eğilim göstermektedir. Kong vd. tarafından geliştirilen entegre tasarım prosedürü [7] ve Bourabia vd. tarafından sunulan optimizasyon tabanlı yöntem [6], tasarım sürecini hızlandırmayı ve tasarımcı bağımlılığını azaltmayı amaçlamaktadır. Bu çalışmada ise daha klasik bir yaklaşımla hız üçgenleri ve temel termodinamik/akışkanlar mekaniği denklemleri kullanılarak yapılan ön tasarım, elde edilen geometrinin performans kriterlerini sağlayabildiğini ortaya koymuştur. Böylece, literatürdeki ileri optimizasyon ve deneysel doğrulama temelli yöntemlerden farklı olarak, klasik ön tasarım metodolojisinin pratik uygulanabilirliği ve doğruluğu vurgulanmıştır.

Sonuçların özellikle izentropik verim ve basınç oranı açısından hedef değerleri karşılaması, yöntemin geçerliliğini desteklemektedir. Ayrıca, ANSYS Vista CCD ve BladeGen modülleri ile hesaplanan parametrelerin hızlı bir şekilde üç boyutlu geometriye aktarılabilmesi, tasarım sürecinin esnekliğini ve uygulanabilirliğini göstermektedir. Bu yönüyle çalışma, literatüre klasik hesaplama yöntemlerinin güncel yazılım araçlarıyla bütünleştirilerek kullanılabileceğini göstermesi bakımından katkı sağlamaktadır.

Bununla birlikte, tasarlanan geometriye yönelik CFD analizleri ve deneysel doğrulamalar ilerleyen çalışmalarda gerçekleştirilerek bulguların daha geniş kapsamlı olarak değerlendirilmesi planlanabilir. Bu sayede, elde edilen ön tasarımın gerçek çalışma koşullarındaki performansı da net bir şekilde ortaya konabilecektir.

5. SONUÇLAR

Bu çalışmada, turboşarj sistemlerinde kullanılan radyal kompresör için ön tasarım metodolojisi ortaya konulmuştur. Öncelikle kompresörün servis koşulları ve hedeflenen performans parametreleri tanımlanmış, ardından hız üçgenleri ve temel termodinamik/akışkanlar mekaniği denklemleri kullanılarak hesaplamalar gerçekleştirilmiştir. Elde edilen değerler doğrultusunda Vista CCD modülü ile ön tasarım yapılmış ve BladeGen ortamında üç boyutlu çark geometrisi elde edilmiştir. Çalışmanın sonucunda:

- Hesaplanan parametreler ile elde edilen çark geometrisinin hedeflenen basınç oranı ($3 \pm 0{,}05$) ve izentropik verim ($\geq 0{,}85$) değerlerini sağlayabilecek bir ön tasarıma ulaşılmıştır.

- Klasik ön tasarım hesaplarının, modern yazılım araçları ile bütünleştirilerek kullanılmasının hızlı, doğru ve esnek bir tasarım süreci sunduğu ortaya konmuştur.
- Elde edilen geometri, farklı konfigürasyonların denenmesine ve sonraki aşamalarda CFD analizleri ve optimizasyon çalışmaları ile daha ileri seviyede geliştirilmesine uygundur.
- Dolayısıyla bu çalışma, turboşarj sistemlerinde kullanılan radyal kompresörlerin ön tasarım sürecine yönelik uygulanabilir, sistematik ve optimize edilebilir bir yaklaşım sunmaktadır.

SUMMARY

Accurate kinetic modeling is essential for optimizing biomass pyrolysis processes such as slow, intermediate, and fast pyrolysis. Traditional first-order kinetic models often fail to capture the complex, multi-reaction nature of lignocellulosic decomposition. In this study, the pyrolysis behaviour of oak bark was investigated using thermogravimetric analysis (TGA) at heating rates of 10, 15, and 20 K/min, following guidelines of International Confederation for Thermal Analysis and Calorimetry (ICTAC 2014). To represent the multistep kinetics, a total of 6 distributed activation energy models (DAEM) were tested, including 2 and 3 Gaussian distributions and a 2-Weibull distribution-based multiple-heating rate models. The 3-Gaussian multiple heating rate DAEM achieved the best fit (R^2 = 0.9922), effectively resolving overlapping thermal events. The Weibull distribution-based model with multiple heating rates also performed well (R^2 = 0.9905), better capturing asymmetric degradation patterns. Validation was carried out using the isoconversional Friedman method, which revealed significant variation in activation energies across the conversion range confirming the distributed kinetic nature of the system. Two primary activation energy regions were identified: First 100 kJ/mol (initial devolatilization) and later 152 kJ/mol (mid-stage decomposition). The findings demonstrate that distributed models significantly outperform traditional first-order approaches for pyrolysis kinetics and provide more realistic representations of thermal behavior of bark. This work supports the thermochemical valorization of barks and highlights the importance of advanced kinetic modeling in waste biomass conversion research.

INTRODUCTION

Pyrolysis is an important thermochemical process to produce biochars and bio-oils from renewable sources such as waste lignocelulosic biomass. The pyrolysis reactions of biomass are often complex and include several overlapping steps due to the heterogeneous chemical composition of biomass. The kinetics of biomass pyrolysis is usually described by a first step degradation kinetics with a single activation energy which is a good approximation but may not explain the kinetics of thermal degradation. Alternatively, the thermal degradation reactions may be modelled by a several parallel first-order or n-th order reactions with variable activation energies (Cai et al., 2014)**.** The activation energies may be modelled by a Gaussian distribution or alternative distribution functions such as Weibull distribution to capture the intrinsic differences between the activation energies of biomass components such as polysaccharides (cellulose and hemicelluloses) and lignin (Yang et al. 2024). The apparent activation energies of biomass may be determined by using a single heating rate or by employing multiple heating rates which is an improvement of the single-heating rate based kinetic analysis. The objectives of this study are to characterize the pyrolysis behavior of oak bark, to evaluate the performance of advanced kinetic modeling approaches by testing a total of 6 distributed activation energy models (DAEM), and to assess the advantages of distributed models over traditional first-order kinetics in describing bark pyrolysis.

RESEARCH AND FINDINGS

A total of 100 g bark samples of Kasnak oak (*Quercus vulcanica*) were obtained from Isparta, Turkey, reduced to 250-420 µm particle size and oven-dried at 60 ºC for 1h and stored in air-tight bags before thermogravimetric analyses. The ash, lignin, suberin, and polysaccharide contents of the analyzed material was 15%, 22%, 4%, and 35%, respectively based on oven-dry weight. Thermogravimetric analysis (TGA) of oak bark samples was carried out following ICTAC 2014 kinetic guidelines (Vyazovkin et al. 2014). A total of 5-7 mg dried and milled bark samples were heated under an inert atmosphere between 25 ºC and 800 ºC using a dynamic heating program at three heating rates (10, 15, and 20 K/min) to generate a reliable single and multi-heating-rate dataset for kinetic analysis. Kinetic modeling was performed by applying 6 distributed activation energy models to represent the multistep nature of oak bark pyrolysis. The tested models included two- and three-Gaussian DAEM formulations as well as a two-Weibull distribution–based model, allowing comparison between symmetric (Gaussian) and asymmetric (Weibull) energy-distribution functions (**Table 1**). Each model was globally fitted to the TG/DTG data from all three heating rates to resolve overlapping decomposition events and estimate distributed activation energy profiles. Kinetic parameters were optimized using standard nonlinear regression methods.

Table 1. Distributed activation energy models tested in this study

Daem models	Abbreviation	Heating rate (K/min)	Number of pseudocomponents	Distribution function
Model 1	M1	10	1	Gaussian
Model 2	M2	10	2	Gaussian
Model 3	M3	10	3	Gaussian
Model 4	M4	10, 15, 20	3	Gaussian
Model 5	M5	10, 15, 20	2	Gaussian
Model 6	M6	10, 15, 20	2	Weibull

Model performance was evaluated using goodness-of-fit statistics (R^2). To validate the distributed kinetic behavior, the isoconversional Friedman method was applied independently (Arenas et al. 2019).

The thermal decomposition profile of the tested biomass is shown in **Fig 1**. As expected, bark did not show a homogeneous thermal decomposition pattern. The decomposition rate was fast between the temperatures approximately 200 ºC and 400 ºC and gradually become slower until 700 ºC and increased again between 700 ºC and 750 ºC. The first decomposition region possibly corresponds to the decomposition of polysaccharides, and second decomposition region corresponds to the degradation of lignin and suberin. The final region possibly occurs by the degradation of char produced in the previous steps. This decomposition pattern agrees with previous publications on the thermal decomposition of lignocellulosic wastes (Chen et al. 2015; Fetisova et al. 2023).

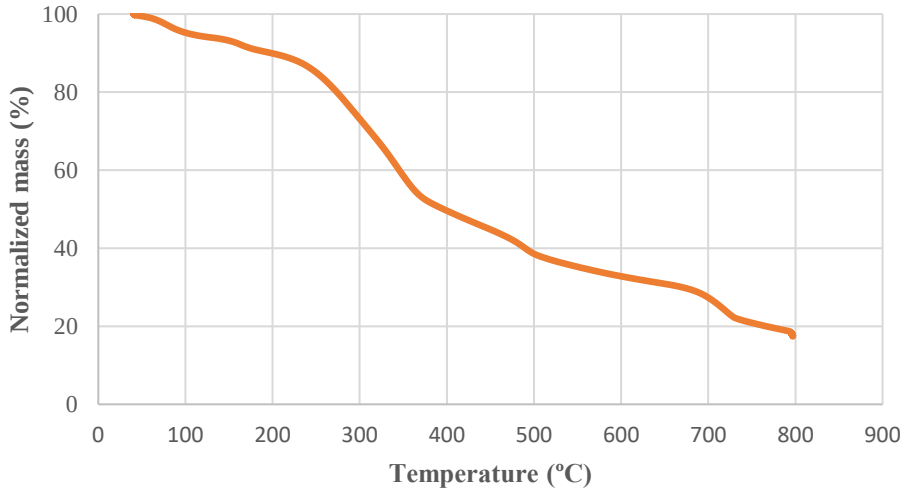

Fig 1. Thermal decomposition of *Q. vulcanica* bark under dynamic heating (Representative curve at heating rate=10 °C/min)

The result of the kinetic modelling is shown in **Table 2**. The DAEM methods distinguished 2 or 3 thermal degradation regions with activation energies approximately 100, 150, and 300 kJ/mol which supports our previous interpretation of the thermal degradation.

Table 2. Activation energies and correlation coefficients of the tested kinetic models

Daem models	Abbreviation	Heating rate (K/min)	Number of pseudocomponents	Ea (kJ/mol)	R^2
Model 1	M1	10	1	185	0.968
Model 2	M2	10	2	158 268	0.997
Model 3	M3	10	3	170 225 289	0.997
Model 4	M4	10, 15, 20	3	100 152 290	0.992
Model 5	M5	10, 15, 20	2	100 152	0.992
Model 6	M6	10, 15, 20	2	101 138	0.990

The single-heating rate-based models seem to capture well the second and the third regions, while the multiple-heating rate-based models captured all three thermal decomposition regions with the first two regions being the principal thermal decomposition regions. Multiple heating rates fitting allows for simultaneous optimization of kinetic parameters in different heating rates. The results of multiple heating rates provide more reliable kinetic data because it removes the compensation between frequency factor and apparent activation energy caused by fitting only a single heating rate. Also, it is physically meaningful because the activation energies obtained are fixed independent of heating rate. It reduces overfitting and allows for prediction of activation energies in different heating rates. On the other hand, it takes a much higher time to compute the kinetic parameters because the fitting is more complex. To further improve the results of DAEM models, Weibull distribution was also tested which resulted in a good fitting (R^2=0.99). The Weibull distribution-based DAEM is considered a more reliable model because it captures the asymmetric thermal degradation of biomass components such as lignin. After employing DAEM-based kinetic analysis, the results were validated using the isoconversional Friedman method (**Fig 3**). The Friedman analysis showed a non-constant activation energy supporting the use of DAEM to study multi-step or complex reaction mechanisms.

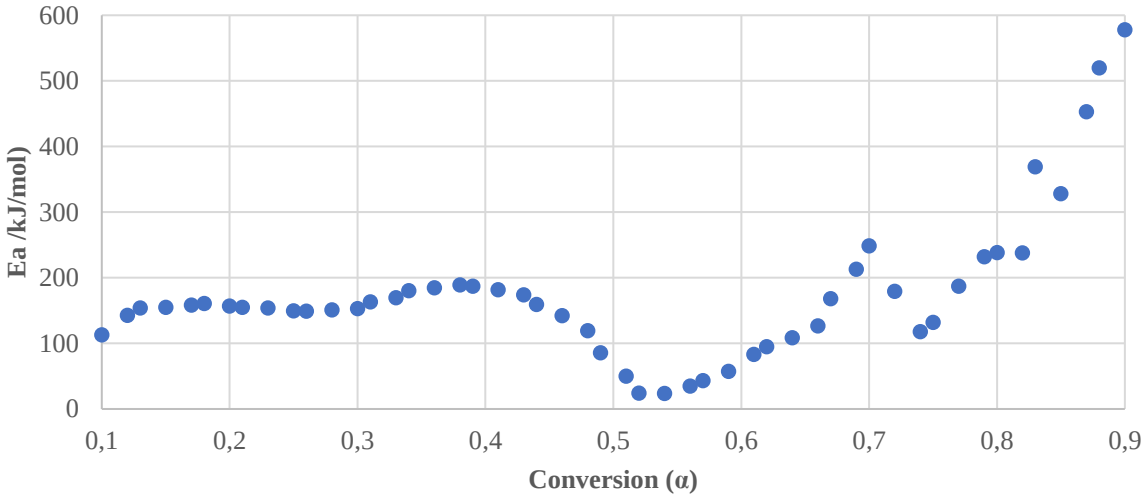

Fig. 3. Application of isoconversional Friedman method for validation of DAEM

CONCLUSION

The results of this study show that the thermal decomposition of *Quercus vulcanica* bark proceeds into two major steps with higher and lower activation energies, possibly reflecting faster and slower decomposing biomass fractions. All DAEM models with Gaussian and Weibull distributions have excellent R^2 (>0.99) values except for single heating 1-pseudocomponent model. The 2-pseudocomponent Weibull-distribution-based multi-heating model resulted in the best results considering the asymmetric degradation pattern of biomass components. The DAEM results were validated by isoconversional Friedman method.

Two primary activation energy regions were identified: First approximately at 100 kJ/mol (initial devolatilization) and later at 152 kJ/mol (mid-stage decomposition). The findings demonstrate that distributed models significantly outperform traditional single activation energy-based models for pyrolysis kinetics and provide more realistic representations of thermal behavior of oak bark. This work supports the thermochemical valorization of lignocellulosic wastes and highlights the importance of advanced kinetic modeling in waste biomass conversion research.

ÖZET

Küçük ada devletleri, enerji ve su temini konusunda dışa bağımlılık, fosil yakıtlara dayalı yüksek maliyetler ve iklim değişikliğinin getirdiği zorluklarla karşı karşıyadır. Bu durum, enerji ve su güvenliğinin sürdürülebilir biçimde sağlanabilmesi için yenilikçi yaklaşımların geliştirilmesini zorunlu kılmaktadır. Bu çalışmada, enerji ve su güvenliğini artırmak amacıyla fotovoltaik (PV) panellerle desteklenen ters ozmos (RO) deniz suyu arıtma ve deniz suyu kaynaklı ısı pompası (SWHP) sistemlerinin entegrasyonu, Kuzey Kıbrıs Türk Cumhuriyeti (KKTC) özelinde bir vaka çalışması olarak ele alınmıştır. Modelleme çalışması, Gazimağusa bölgesinin iklimsel verileri kullanılarak MATLAB ortamında gerçekleştirilmiştir. PV sistemi ile üretilen elektrik enerjisi, hem RO ünitesinin tatlı su üretiminde hem de SWHP sisteminin ısıtma ve soğutma yüklerinde kullanılmıştır. Sonuçlar, entegre sistemin yıl boyunca pozitif enerji dengesi ile çalışabildiğini ve özellikle yaz aylarında PV üretim fazlası sayesinde RO su üretiminin maksimum seviyelere ulaştığını göstermiştir. SWHP modülünün COP değerleri 3–5 aralığında gerçekleşmiş, deniz suyu sıcaklığının yüksek olduğu dönemlerde sistem verimliliği artmıştır. Bu entegre modelin, KKTC gibi küçük ada devletlerinin sürdürülebilir kalkınma hedeflerine ulaşmasında kritik bir rol oynayabileceği; enerji verimliliği, karbon emisyonlarının azaltılması ve su kaynaklarının yönetimi açısından önemli katkılar sunabileceği öngörülmektedir. Çalışma, ada ölçeğinde yenilenebilir enerji tabanlı su ve ısı sistemlerinin bütüncül olarak değerlendirilmesi için bir temel oluşturmakta ve benzer coğrafyalarda uygulanabilecek sürdürülebilir bir çözüm önermektedir.

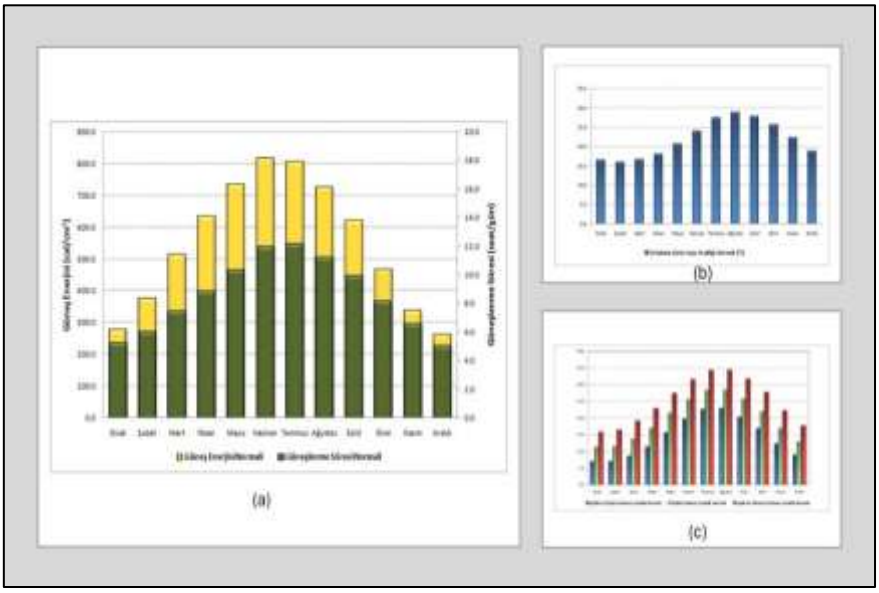
INTEGRATED ASSESSMENT OF PHOTOVOLTAIC, REVERSE OSMOSIS, AND SEAWATER HEAT PUMP SYSTEMS IN THE CONTEXT OF ENERGY AND WATER SUSTAINABILITY: A CASE STUDY FOR THE TURKISH REPUBLIC OF NORTHERN CYPRUS



ABSTRACT

Small island states face persistent challenges in energy and water supply due to high dependence on imports, elevated fossil fuel costs, and increasing climate change pressures. These challenges necessitate the development of innovative, sustainable systems capable of ensuring long-term resource security. This study investigates the integration of photovoltaic (PV) panels, reverse osmosis (RO) desalination, and seawater heat pump (SWHP) technologies as a holistic solution to improve energy and water security, using the Turkish Republic of Northern Cyprus (TRNC) as a case study. The modeling process was conducted in MATLAB using the climatic data of the Famagusta region. Electricity generated by PV panels was utilized simultaneously to power the RO desalination unit and the SWHP system for heating and cooling loads. The results indicated that the integrated configuration operated with a positive net energy balance throughout the year. During summer months, the high solar irradiance levels led to maximum RO water production, while the SWHP exhibited coefficients of performance (COP) ranging between 3 and 5, achieving higher efficiency when seawater temperatures increased. The findings suggest that this integrated model can play a critical role in advancing the sustainable development goals of small island regions such as the TRNC. It offers significant potential for improving energy efficiency, reducing carbon emissions, and enhancing water resource management. Overall, the study provides a framework for the combined use of renewable energy, desalination, and thermal systems, proposing a scalable and sustainable solution applicable to similar coastal and island environments.

Keywords: Photovoltaic (PV), Reverse Osmosis (RO), Seawater Heat Pump (SWHP), Turkish Republic of Northern Cyprus (TRNC)

GİRİŞ

Kuzey Kıbrıs Türk Cumhuriyeti gibi küçük ada ekonomileri, izole ve sınırlı kaynaklara sahip olmaları nedeniyle enerji ve su temininde önemli zorluklarla yüzleşmektedir [1]. KKTC'nin elektrik enerjisi üretiminin büyük ölçüde ithal fosil yakıtlara dayanması, enerji maliyetlerini ve karbon ayak izini artırmaktadır. Benzer şekilde, artan nüfus ve kuraklık riski, kısıtlı yeraltı su kaynakları üzerinde ciddi bir baskı oluşturmakta ve su güvenliğini tehdit etmektedir. Adanın yıllık ortalama güneşlenme süresi oldukça yüksek olup, fotovoltaik enerji üretimi için büyük bir potansiyel barındırmaktadır (Şekil 1) [2]. Su kaynakları açısından ise, yeraltı sularının aşırı çekimi ve tuzlanma riski önemli bir sorundur. Türkiye'den deniz altı boru hattı ile su temini projesi su arzına önemli bir katkı sağlasa da, yerel ve sürdürülebilir su kaynaklarının geliştirilmesi stratejik önemini korumaktadır [3]. Özellikle turizm bölgeleri (Gazimağusa) ve kıyı yerleşimlerinde su ve enerji talebi yoğundur. Bu bağlamda, adanın bol güneş enerjisi potansiyelinden ve çevresindeki denizden faydalanarak yenilikçi ve sürdürülebilir çözümler geliştirmesi stratejik bir önem taşımaktadır.

Şekil 1. KKTC meteorolojik verileri, (a) Güneş ışınımı, (b) Deniz suyu sıcaklığı, (c) Hava sıcaklığı [2]

Fotovoltaik sistemlerle entegre ters ozmos (PV-RO) tuzdan arındırma ve ısıtma-soğutma ihtiyaçları için deniz suyu kaynaklı ısı pompaları (SWHP), bu zorluklara yanıt verebilecek iki öncü teknoloji olarak öne çıkmaktadır. Bu iki sistemin entegrasyonu, enerji ve su döngüleri arasında bir sinerji yaratarak kaynak verimliliğini maksimize etme potansiyeli taşımaktadır. Bu çalışma, böyle bir entegre sistemin teknik ve ekonomik fizibilitesini KKTC bağlamında değerlendirmeyi amaçlamaktadır.

Ters ozmos, deniz suyundan tatlı su elde etmek için en yaygın kullanılan teknolojilerden biridir, ancak yüksek enerji tüketimi en büyük dezavantajıdır [4]. PV panellerin RO sistemlerine entegrasyonu, özellikle şebekeden uzak veya elektrik maliyetlerinin yüksek olduğu bölgeler için cazip bir çözüm sunmaktadır. Literatürdeki çalışmalar, PV-RO sistemlerinin küçük ölçekli uygulamalardan büyük tesislere kadar geniş bir yelpazede teknik olarak uygulanabilir olduğunu göstermektedir [5-7]. Bu sistemlerin tasarımı, güneş ışınımının değişkenliğine bağlı olarak kesintisiz su üretimi sağlamak amacıyla genellikle enerji depolama (batarya) birimlerini de içermektedir [5]. Yapılan tekno-ekonomik analizler, PV panellerin maliyetindeki düşüşle

birlikte, PV-RO sistemlerinin geleneksel yöntemlere kıyasla rekabet gücünün arttığını ortaya koymaktadır [5, 6].

Deniz suyu kaynaklı ısı pompaları (SWHP), kışın ısıtma için deniz suyunu ısı kaynağı, yazın ise soğutma için bir ısı çukuru olarak kullanan yüksek verimli sistemlerdir [8]. Deniz suyunun sıcaklığının yıl boyunca havaya göre daha kararlı olması, SWHP hava kaynaklı ısı pompalarına göre daha yüksek ve stabil bir performans katsayısına (COP) sahip olmasını sağlar [9]. Özellikle Akdeniz iklim kuşağında, kıyı şeridindeki oteller, konutlar ve ticari binalar için ısıtma, soğutma ve sıcak su temininde önemli enerji tasarrufu potansiyeli sunmaktadır. SWHP sistemleri, titanyum eşanjörler gibi korozyona dayanıklı malzemeler gerektirse de, uzun vadede işletme maliyetlerini önemli ölçüde düşürebilir.

PV-RO ve SWHP sistemlerinin entegrasyonu üzerine yapılan çalışmalar henüz sınırlı olmakla birlikte, bu iki teknolojinin bir arada kullanılmasının önemli avantajlar sağlayacağı açıktır. PV sistemi, hem RO tesisinin hem de SWHP elektrik ihtiyacını karşılayarak fosil yakıt tüketimini ve işletme maliyetlerini azaltabilir. Ayrıca, RO tesisinden çıkan ve sıcaklığı bir miktar düşmüş olan deniz suyu, SWHP soğutma çevriminde kullanılarak sistemin verimliliğini artırabilir. Bu tür entegre yaklaşımlar, kaynakların daha verimli kullanılmasını sağlayarak döngüsel ekonomi prensiplerine de katkıda bulunur.

Çalışma, KKTC iklim koşulları temelinde geliştirilen bir enerji-su dengesi yaklaşımını ele alır. Sistem, MATLAB [10] tabanlı bir modelleme ortamında, PV üretimi ile RO ve SWHP talepleri arasındaki zaman bazlı enerji akışını inceler. Böylece, ada ölçeğinde yenilenebilir enerji kaynaklarının su üretimi ve termal sistemlerle bütünleşik kullanımının teknik uygulanabilirliği değerlendirilmektedir.

MATERYAL & METOT

Modelleme, üç temel alt modül üzerine kuruludur: PV enerji üretimi, ters ozmos su üretimi, ve deniz suyu ısı pompası performansı. Her bir modül, saatlik veya günlük zaman adımlarında çalıştırılarak, enerji ve su akışlarının dinamik dengesi elde edilir.

Bir PV sisteminin üreteceği enerji (E_{PV}), anlık güneş radyasyonu (G_t) ve panel sıcaklığına bağlı olarak hesaplanır (Eş.1) [11]:

$$E_{PV} = A_{PV} \times G_t \times \eta_{PV(T)} \times PR \quad (1)$$

Burada; A_{PV} toplam PV panel alanını (m^2), G_t ortalama global güneş ışınımını (kWh/m^2), $\eta_{PV(T)}$ sıcaklığa göre değişen PV panel verimliliğini (%)(Eş. 2) ve PR performans oranını (sistem kayıpları 0.75-0.85) ifade etmektedir.

$$\eta_{PV(T)} = \eta_{ref}[1 - \beta[T_{hücre} - 25)] \quad (2)$$

β sıcaklık katsayısını göstermektedir ve yaklaşık olarak 0.004-0.005 1/°C değerindedir.

RO sisteminin spesifik enerji tüketimi (SEC_{RO}), üretilen her bir metreküp su için harcanan enerjiyi ifade eder (kWh/m^3). Toplam enerji ihtiyacı (E_{RO}) Eşitlik 3 ile bulunur [4]:

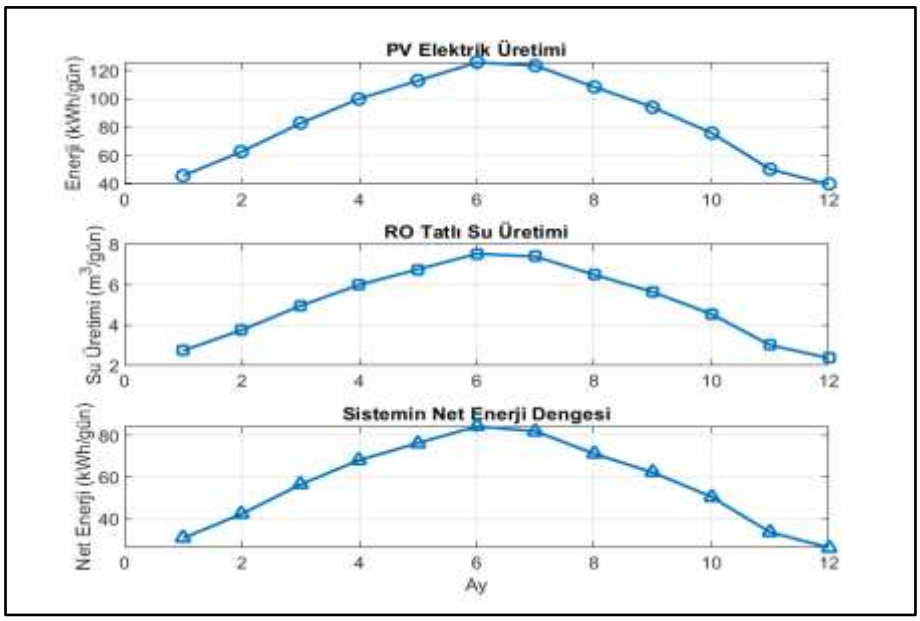
$$E_{RO} = V_{su} \times SEC_{RO} \quad (3)$$

SEC_{RO} deniz suyu için tipik olarak 3-5 kWh/m^3 arasındadır.

SWHP performansı, deniz suyu sıcaklığı (T_{sea}) ve ortam sıcaklığı (T_{air}) farkına bağlıdır. Performans katsayısı (COP) Eşitlik 4 ile bulunur [9]. Deniz suyunun kararlı sıcaklığı sayesinde $SWHP_{COP}$ değerleri genellikle 4 ila 6 arasında değişir, bu da onları oldukça verimli

kılar. Buna bağlı olarak ısıtma/soğutma için gerekli enerji ihtiyacı (E_{SWHP}) Eşitlik 5 ile hesaplanmaktadır.

$$SWHP_{COP} = \frac{T_{evap}+273}{T_{cond}-T_{evap}} \quad (4)$$



$$E_{SWHP} = \frac{\dot{Q}_{yük}}{SWHP_{COP}} \quad (5)$$

Toplam sistem dengesi Eşitlik 6 ile bulunur. Pozitif değer enerji fazlasını, negatif değer ise sistemin dış kaynak ihtiyacını gösterir.

$$E_{net} = E_{PV} - (E_{RO} + E_{SWHP}) \quad (6)$$

BULGULAR

Gazimağusa koşullarına göre oluşturulan PV–RO–SWHP entegre modelinin sonuçları Şekil 2'de verilmiştir. Güneşlenme değerlerinin mevsimsel değişimi, sistemin enerji üretimi ve su çıktıları üzerinde doğrudan etkili olmuştur.

Şekil 2. Çalışma özeti.

PV elektrik üretimi, yıl boyunca 40–130 kWh/gün aralığında değişmiştir. En yüksek üretim haziran–temmuz döneminde gözlenmiş, bu dönemde ortalama güneşlenme 340–360 W/m^2 civarına ulaşmıştır. Kış aylarında üretim 40–60 kWh/gün düzeyine düşmüştür. Bu sonuç, ada ölçeğinde PV tabanlı enerji sistemlerinin mevsimsel dalgalanmaya duyarlı olduğunu göstermektedir.

RO tatlı su üretimi, PV üretimiyle orantılı olarak artış göstermiştir. Haziran ve temmuz aylarında günlük ortalama 7–8 m^3 su üretimi sağlanmıştır. Kış aylarında bu miktar 2–3 m^3/gün seviyelerine kadar gerilemiştir. Bu durum, PV üretim fazlasının doğrudan RO ünitesine yönlendirilmesinin ada su arzında etkin bir strateji olduğunu ortaya koymaktadır.

Sistemin net enerji dengesi, yıl boyunca pozitif değerler göstermiştir; yani PV üretimi, RO ve SWHP tüketimlerinin toplamını karşılayabilmiştir. En yüksek net enerji değeri yaklaşık 85 kWh/gün ile yaz ortasında elde edilmiştir. Bu değer, sistemin dış enerjiye bağımlı olmadan

çalışabildiği dönemi temsil etmektedir. Kış aylarında ise net enerji 30–40 kWh/gün düzeyine inmiş, bu da düşük ışınım koşullarında sistemin sınırlı performansını göstermektedir.

Genel olarak model, PV kaynaklı elektrik üretiminin ada ölçeğinde hem tatlı su üretimi hem de ısıtma/soğutma yüklerini aynı anda karşılayabilecek düzeyde olduğunu ortaya koymaktadır. SWHP modülünün COP değerleri 3–5 aralığında gerçekleşmiş, özellikle deniz suyu sıcaklığının 24–27 °C'ye ulaştığı yaz aylarında sistemin toplam verimi artmıştır.

Sonuçlar, entegre PV–RO–SWHP sisteminin Gazimağusa gibi küçük ada yerleşimlerinde enerji-su-ısı yönetimi açısından sürdürülebilir ve uygulanabilir bir çözüm sunduğunu göstermektedir. Model, ada ölçeğinde mevsimsel planlama yapılmasına olanak tanıyan bir araç niteliği taşımaktadır.

SONUÇLAR & ÖNERİLER

Fotovoltaik paneller, ters ozmos ve deniz suyu kaynaklı ısı pompası teknolojilerinin entegrasyonu, KKTC gibi küçük ada devletlerinin karşılaştığı enerji ve su sorunlarına sürdürülebilir ve yenilikçi bir çözüm sunma potansiyeline sahiptir. Bu entegre yaklaşım, fosil yakıtlara olan bağımlılığı azaltarak enerji güvenliğini artırmakta, su kıtlığına karşı yerel ve güvenilir bir kaynak yaratmakta ve ısıtma-soğutma süreçlerinde enerji verimliliği sağlayarak ekonomik fayda üretmektedir.

Model sonuçları, PV-RO-SWHP sisteminin Gazimağusa iklim koşullarında yıl boyunca pozitif enerji dengesi ile çalışabildiğini ve su üretimini istikrarlı şekilde sürdürebildiğini göstermiştir. Özellikle yaz aylarında güneşlenmenin artmasıyla birlikte, sistemin hem enerji fazlası oluşturduğu hem de su üretimini maksimum seviyeye ulaştırdığı gözlemlenmiştir. Bu durum, adalar için yenilenebilir tabanlı trijenerasyon yaklaşımının teknik olarak uygulanabilir olduğunu doğrulamaktadır.

KKTC'nin coğrafi ve iklimsel özellikleri, bu tür sistemlerin uygulanması için oldukça elverişlidir. Uzun kıyı şeridi ve yüksek güneşlenme süresi, PV tabanlı elektrik üretimi ile deniz suyu kaynaklı ısı pompası teknolojisinin birlikte değerlendirilmesini kolaylaştırmaktadır. Özellikle kıyı bölgelerinde yer alan oteller ve turistik tesisler, hem yüksek su tüketimi hem de yoğun iklimlendirme gereksinimleri nedeniyle bu entegre modelin en uygun uygulama alanlarını oluşturmaktadır.

Bu tesislerin çatılarına veya yakın arazilerine kurulacak PV sistemleri, hem içme ve kullanma suyu üretecek RO tesislerini hem de ısıtma-soğutma hizmeti sağlayacak SWHP sistemlerini besleyebilir. Böyle bir uygulama, işletme maliyetlerini düşürürken aynı zamanda çevre dostu "yeşil otel" konseptini destekler ve pazarlama açısından da avantaj sağlar. Yeni gelişen kıyı yerleşimlerinde merkezi veya dağıtık ölçekli entegre sistemlerin kurulması, şebeke üzerindeki yükü azaltarak bölge halkına daha düşük maliyetli ve güvenilir su ve iklimlendirme hizmetleri sunulmasına olanak verebilir.

Ayrıca, PV-RO sistemleri tarımsal sulama için gerekli tatlı suyun üretiminde de değerlendirilebilir. Bu sayede yeraltı su kaynakları üzerindeki baskı azalacak, tarımsal üretimin sürdürülebilirliği desteklenecektir. Sistem, uzun vadede işletme maliyetlerinin düşürülmesi, karbon emisyonlarının azaltılması ve su kaynaklarının korunması açısından da önemli faydalar sunmaktadır.

Sonuç olarak, PV–RO–SWHP entegre modelinin, KKTC'nin sürdürülebilir kalkınma hedeflerine ulaşmasında, özellikle turizm ve yerleşim bölgelerinde yaşam kalitesini artırma yönünde stratejik bir araç olabileceği değerlendirilmektedir.

Gelecek çalışmalarda KKTC'de seçilecek pilot bir bölgede detaylı fizibilite çalışması, dinamik simülasyonlar ve yaşam döngüsü maliyet analizleri yapılarak yatırımın geri dönüş sürelerinin belirlenmesi önerilmektedir. Ayrıca, bu teknolojilerin yaygınlaşmasını destekleyecek yasal düzenlemelerin ve teşvik mekanizmalarının geliştirilmesi, sistemin ada genelinde benimsenmesini hızlandıracaktır.

ÖZET

Elektrikli araçların (EA) giderek yaygınlaşması, tüketicilerin karmaşık ve dinamik piyasalarda ürün alternatiflerini değerlendirmelerine yardımcı olabilecek sistematik ve belirsizliğe odaklı karar destek çerçevelerine olan ihtiyacı ortaya koymaktadır. Bu çalışma, EA değerlendirmelerinde öznel algıları ve belirsiz değerlendirmeleri etkin bir şekilde yakalamak için bulanık–bulanık sistem–tasarım eşleştirmeleri kullanan Aksiyomatik Tasarım (AT) tabanlı bir öneri modelini tanıtmaktadır. Bu çerçevede, konfor, uygun fiyat ve menzil gibi elektrikli araç seçiminde etkili faktörler bulanık sayılarla temsil edilmekte, böylece model, kullanıcı değerlendirmeleri ve ürün özelliklerinde yer alan algısal belirsizlik ve muğlaklığı ifade edebilmektedir. Modelin gerçekçiliğini ve karar duyarlılığını artırmak için, bireysel kriterlerin göreli önemini içerecek şekilde ağırlıklı bir AT formülasyonu önerilmiş, bilgi içeriğinin hesaplanması iyileştirilmiş ve karar ayrımı güçlendirilmiştir. Önerilen model, çeşitli özelliklerin bulanık değerlendirmeleri içeren bir EA veri seti üzerinde gösterilmiştir. Bulgular, bulanık modelleme ve kriter ağırlıklandırmasının entegrasyonunun çerçevenin yorumlanabilirliğini, duyarlılığını ve gerçek dünya karar davranışlarıyla uyumunu önemli ölçüde artırdığını göstermektedir. Bu çalışma, Aksiyomatik Tasarımın teorik ve pratik uygulanabilirliğini bulanık karar ortamlarına genişleterek literatüre katkıda bulunmakta ve EA alanında zeki, belirsizliğe dayanıklı öneri sistemlerinin geliştirilmesi için sağlam bir metodolojik temel sunmaktadır.

TOWARD AN UNCERTAINTY-TOLERANT ELECTRIC VEHICLE RECOMMENDATION SYSTEM VIA WEIGHTED AXIOMATIC DESIGN

ABSTRACT

The increasing adoption of electric vehicles (EVs) highlights the need for systematic and uncertainty-oriented decision-support frameworks that can assist consumers in evaluating product alternatives in complex and dynamic markets. This study introduces an Axiomatic Design (AD)–based recommendation model that employs fuzzy–fuzzy system–design pairings to effectively capture subjective perceptions and imprecise evaluations in EV assessments. Within this framework, factors influencing electric vehicle selection—such as comfort, affordability, and driving range—are represented using fuzzy numbers, allowing the model to express perceptual vagueness and uncertainty inherent in user evaluations and product characteristics. To improve the model's realism and decision sensitivity, a weighted AD formulation is proposed to incorporate the relative importance of individual criteria, refining the computation of information content and enhancing decision discrimination. The proposed model is demonstrated through a dataset of EVs featuring fuzzy evaluations of diverse attributes. The findings indicate that the integration of fuzzy modeling and criterion weighting significantly enhances the framework's interpretability, responsiveness, and alignment with real-world decision behavior. This study contributes to the literature by extending the theoretical and practical applicability of Axiomatic Design to fuzzy decision environments, while providing a rigorous methodological foundation for developing intelligent, uncertainty-tolerant recommendation systems in the EV domain.

Keywords: Axiomatic design; Recommendation systems; Electric vehicle selection; Decision support; Fuzzy logic

1. INTRODUCTION

The widespread adoption of electric vehicles (EVs) continues to accelerate due to growing environmental pressures, government incentives, and significant improvements in charging infrastructure and battery technologies. Global commitments to phase out high–fossil-fuel–consuming vehicles by 2030, supported by new legislative measures and national transition plans, further reinforce this shift (Ibrahim et al., 2023). However, EV selection remains a complex multi-criteria decision-making (MCDM) problem, as consumers and policymakers must simultaneously evaluate cost, driving range, battery performance, charging accessibility, safety, environmental impact, and brand reliability. This complexity is intensified by uncertainties in key performance parameters, often caused by incomplete data or inconsistencies in manufacturer-reported specifications. Therefore, transparent and uncertainty-sensitive decision-support methods are essential for guiding stakeholders toward the most appropriate EV choice.

Axiomatic Design (AD) offers a structured theoretical framework for organizing and evaluating decision problems under uncertain conditions. Its core principles—the independence and information axioms—enable a formal assessment of how effectively design parameters meet functional requirements. Incorporating fuzzy representations into AD enhances its capacity to address real-world decision-making scenarios, where uncertainty may result from subjective evaluations, imprecise data, or variable system conditions. In this research, we introduce a fuzzy-based AD approach to facilitate EV evaluation and recommendation under uncertain circumstances. Relevant vehicle characteristics—such as driving range, charging time, battery capacity, and performance measures—are expressed as fuzzy variables, reflecting both intrinsic imprecision and ambiguity in user judgments. The information axiom is applied to assess the degree of correspondence between user preferences and fuzzy design parameters, enabling a systematic, uncertainty-sensitive ranking of EV alternatives. By combining fuzzy modeling with AD methodology, the proposed framework improves the realism, robustness, and clarity of decision-making, offering a strong foundation for developing intelligent and uncertainty-tolerant recommendation systems in the electric mobility domain.

2. METHODOLOGY

2.1 Axiomatic Design Methodology

The Axiomatic Design (AD) approach offers a systematic framework for translating complex customer requirements into corresponding functional requirements (FRs) and design parameters (DPs). Its main purpose is to improve the rationality and quality of design and decision-making by incorporating fundamental design principles, known as axioms, into the analytical process. First proposed by Suh (1990), AD provides a general methodology to ensure that system designs are logically coherent and information-efficient. The methodology rests on two core axioms: the Independence Axiom, which requires that each functional requirement is fulfilled independently, and the Information Axiom, which aims to minimize the system's information content to produce more reliable and effective designs. Together, these axioms allow a structured evaluation of how well a system's parameters satisfy functional requirements under diverse conditions. When applied to decision environments involving uncertainty, AD demonstrates significant advantages in handling imprecise and variable data. Instead of relying on deterministic assumptions, AD can represent each design parameter or criterion as a fuzzy variable, capturing the inherent uncertainty due to incomplete information, measurement variability, or environmental fluctuations. As noted by Kulak et al. (2010) and Baykasoglu et al. (2024), AD is particularly suitable for multi-criteria decision-making (MCDM) contexts

because it supports hierarchical problem decomposition, facilitates the assessment of fuzzy-defined criteria, and maintains analytical rigor despite uncertainty or incomplete data. Its capability to manage heterogeneous data and systematically quantify uncertainty makes AD a robust foundation for developing interpretable, reliable decision-support systems, especially in complex domains such as electric vehicle evaluation.

2.1.1 Fuzzy Axiomatic Design

In applied decision-making contexts, the specifications of functional requirements (FRs) for both system and design are typically characterized by uncertainty and vagueness. To capture such uncertainty, the Axiomatic Design (AD) framework can be adapted to a fuzzy environment, representing both design and system variables as fuzzy numbers (d and s). These fuzzy representations capture parameter variability more realistically than deterministic values. As shown in Figure 1, a design is considered acceptable when the fuzzy variables exhibit sufficient overlap, delineating a feasible region in which the functional requirement is partially or fully met. The extent of this overlap indicates how effectively the design fulfills its intended performance under uncertainty, supporting a more robust and interpretable decision-making process.

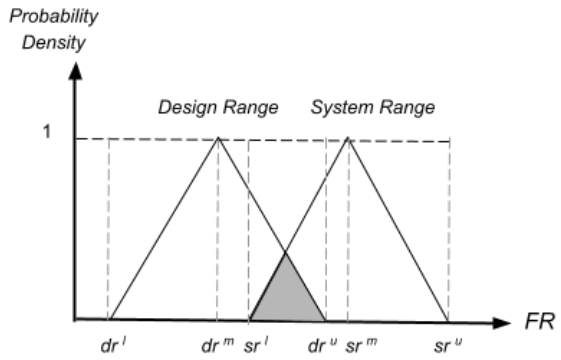

Figure 1. Diagram of design and system ranges in fuzzy decision-making environments. Source(s): Subulan and Baykasoglu (2021)

Assuming a uniform probability distribution for the functional requirement, the probability of its satisfaction can be determined according to Equation 1.

$$p_j = Common\ Range\ /\ System\ Range \tag{1}$$

Equation (2) presents the expression for the information content (I_j) of any FR_jwithin fuzzy environments.

$$I_j = \log_2\left(\frac{1}{p_j}\right) \quad or \quad \log_2\left(System\ Range\ /\ Common\ Range\right) \tag{2}$$

To demonstrate the evaluation of partial satisfaction for a user requirement, an example scenario is provided in which the information content of the price criterion is calculated for a candidate alternative. This calculation is based on the intersection area between the fuzzy representation of the user-defined requirement and the system-provided value, reflecting the degree to which the alternative aligns with user expectations. Let the vehicle's price be represented as the triangular fuzzy number (110, 160, 210), where 110, 160, and 210 denote the minimum, most likely, and maximum prices, respectively. The design requirement for price is defined as the triangular fuzzy number (50, 100, 150), representing the minimum desired price, the target price, and the maximum tolerable price. The corresponding graphical representation is shown in Figure 2.

Information content is first calculated for each criterion and then weighted using normalized criterion weights. A cumulative I value for each alternative is obtained by aggregating these weighted values, and alternatives are ranked in ascending order, with the most preferred option having the lowest I value. This methodology enables the framework to systematically quantify both full and partial satisfaction of requirements, providing a transparent and structured foundation for evaluating and comparing electric vehicle alternatives.

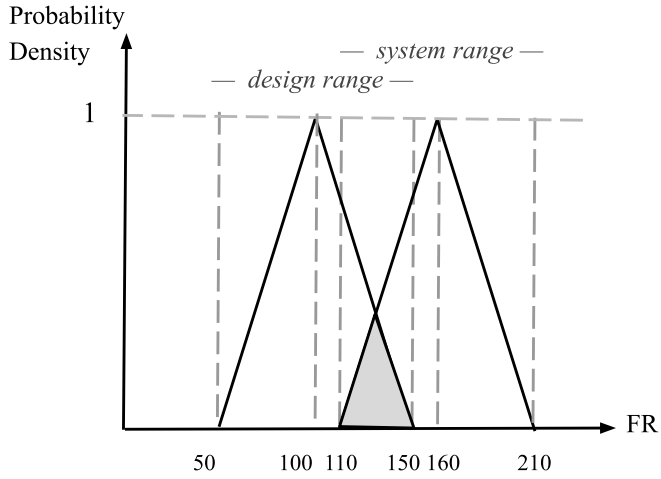

Figure 2. Fuzzy-Based System and Design Range for Alternative 4: Price Criterion

Based on the overlapping region, the I value is determined to be 2.644 using the formula provided below (3):

$$I = log_2\left(\frac{(sU-sL).(dU-dM)+(sU-sL).(sM-sL)}{(\mathrm{dU}-\mathrm{sL})^2}\right) \qquad if\ \ dL < sL < dU < sU \tag{3}$$

2.1.2 Weighted Axiomatic Design

From the decision maker's viewpoint, functional requirements (FRs) frequently vary in their relative importance. Each criterion may be allocated a weight w to more accurately capture its significance in realistic decision-making scenarios. For hierarchical decision-making, the cumulative weight of a functional requirement FR_i is computed as the product of the weights at all levels of the hierarchy relevant to that requirement, with k representing the number of levels.

Weighted information content is computed following the methodology initially introduced by Kulak and Kahraman (2005), refined by Shahbandarzadeh et al. (2011), and further extended by Subulan and Baykasoglu (2021). The weighted information content WI_{ij} is defined as follows (4):

$$WI_{ij} = \begin{cases} \left[\left|\log_2\left(\frac{1}{p_{ij}}\right)\right|^{\frac{1}{\prod_{k\epsilon K} W_{kj}}}\right] & 0 \le I_{ij} \le 1 \\ \left[\left|\log_2\left(\frac{1}{p_{ij}}\right)\right|^{\left(\prod_{k\epsilon K} W_{kj}\right)}\right] & I_{ij} > 1 \\ \prod_{k\epsilon K} W_{kj} & I_{ij} = 1 \\ -\left[\left|\log_2\left(\frac{1}{p_{ij}}\right)\right|^{1-\left(\prod_{k\epsilon K} W_{kj}\right)}\right] & -1 < I_{ij} \le 0 \\ -\left[\left|\log_2\left(\frac{1}{p_{ij}}\right)\right|^{1+\left(\prod_{k\epsilon K} W_{kj}\right)}\right] & I_{ij} \le -1 \\ -\left(1+\left(\prod_{k\epsilon K} W_{kj}\right)\right) & I_{ij} = -1 \end{cases} \quad (4)$$

This weighted formulation allows the Axiomatic Design framework to reflect the relative importance of individual criteria, enhancing the accuracy of information content calculations and improving decision discrimination in hierarchical and multi-criteria contexts.

3. DATA COLLECTION

To demonstrate the applicability of the proposed fuzzy-based Axiomatic Design (AD) framework, a dataset of nine electric vehicle (EV) models was constructed using information adapted from Ziemba's (2021) study. From the available attributes, five criteria—price, driving range, charging time, energy consumption, and vehicle appearance—were selected for analysis, as these parameters inherently involve subjective judgments, measurement variability, or context-dependent performance. Among these, price may fluctuate due to minimum–maximum equipment configurations, optional features, and market-related adjustments, while driving range and energy consumption are influenced by driving habits, temperature, and battery aging; charging time varies across charging infrastructure and operational conditions; and vehicle appearance reflects user perceptions that are intrinsically imprecise. Owing to these sources of uncertainty and subjectivity, each criterion is modeled using fuzzy representations, enabling the framework to more accurately reflect real-world evaluation ambiguity. These selected variables thus provide an appropriate foundation for implementing the fuzzy AD methodology. A concise overview of the dataset is presented in Table 1.

4. CASE STUDY

A case study demonstrating the application of the proposed fuzzy-based Axiomatic Design (AD) framework for electric vehicle (EV) recommendation is presented in this section. In this approach, all relevant decision variables are modeled as fuzzy numbers, enabling a systematic representation of the uncertainty, imprecision, and variability inherent in vehicle specifications and performance metrics. This fuzzy formulation also allows the model to capture real-world variability in EV attributes, such as fluctuations in energy consumption driven by ambient temperature, driving intensity, or battery efficiency. The resulting recommendation system is highly flexible, permitting users to define functional requirements (FRs) and design parameters (DPs) according to their individual evaluation criteria and decision-making priorities.

Table 1. Dataset of EVs with a diverse set of attributes

Alternatives / Criteria	A1 Renault ZOE ZE40 R110	A2 Renault ZOE ZE40 R90	A3 Smart EQ forfour	A4 BMW i3	A5 BMW i3s	A6 Hyundai IONIQ Electric	A7 Volkswagen e-Golf	A8 Nissan LEAF	A9 Nissan LEAF e+
C1 Price (PLN thousand)	(144.4, 151.0, 157.6)	(133.9, 140.1, 146.3)	(96, 108, 120)	(169, 199, 229)	(183.4, 210.3, 237.2)	(164.5, 179.5, 194.6)	(141.9, 168., 194.2)	(157.7, 173.6, 189.5)	(195.6, 203.3, 211.1)
C2 Range (km)	(180, 290, 400)	(180, 290, 400)	(65, 112.5, 160)	(165, 296.5, 428)	(160, 282.5, 405)	(135, 212.5, 290)	(135, 217.5, 300)	(155, 272, 389)	(230, 379, 528)
C3 Charging Time (min)	(135, 817.5, 1500)	(135, 817.5, 1500)	(55, 290, 525)	(255, 712.5, 1170)	(255, 712.5, 1170)	(270, 570, 870)	(315, 667.5, 1020)	(390, 825, 1260)	(600, 1260, 1920)
C4 Energy Consumption (kWh / 100 km)	(10.5, 16.6, 22.8)	(10.4, 16.6, 22.8)	(10.4, 18.05, 25.7)	(10.4, 17.05, 23.7)	(10.7, 17.2, 23.7)	(9.7, 15.2, 20.7)	(10.7, 17.2, 23.7)	(10.3, 16.75, 23.2)	(11.5, 17.9, 24.3)
C5 Vehicle Appearance	(4.2, 5.6, 7)	(4.2, 5.6, 7)	(2.2, 3.3, 4.4)	(3.2, 4.4, 5.6)	(3.2, 4.4, 5.6)	(6, 7.2, 8.4)	(5, 6.2, 7.4)	(6.4, 7.5, 8.6)	(6.4, 7.5, 8.6)

An illustrative example of user-specified requirements is provided in Table 2. In this case study, the user articulated their requirements using fuzzy variables and assigned weights to each criterion based on its relative importance in their decision process.

Table 2. User-defined requirements

Criteria	User Requirements	User Weight
C1 - Price (PLN thousand)	(100, 175, 250)	1
C2 - Range (km)	(200, 375, 550)	5
C3 - Charging Time (min)	(100, 800, 1500)	5
C4 - Energy Consumption (kWh / 100 km)	(10, 15, 20)	1
C5 - Vehicle Appearance	(4, 7, 10)	1

5. FINDINGS

The application of the proposed methodology to the case study resulted in eight out of nine electric vehicles being recommended, with their rankings determined by ordering the computed I values from lowest to highest. Initially, the methodology was executed with equal weighting

across all criteria, followed by an analysis incorporating user-defined weights to capture personal priorities. The corresponding recommendations are presented in Figures 3 and 4. Alternative A3 is omitted from subsequent analysis due to its inability to meet a key criterion—driving range. Within the proposed framework, failure to meet even a single requirement is sufficient to remove an alternative from consideration. To remain eligible for recommendation, each option must fulfill all specified requirements either fully or to an acceptable degree. A fully satisfied requirement results in an information content value of $I = 0$, while partial satisfaction generates a positive I value, calculated in accordance with the information axiom.

6. DISCUSSION AND CONCLUSION

This study extends the classical Axiomatic Design (AD) framework by developing a fuzzy-based approach to manage uncertainty in real-world decision-making, with a focus on electric vehicle (EV) recommendations. By representing all relevant decision variables as fuzzy numbers, the proposed framework systematically captures the imprecision, variability, and uncertainty inherent in vehicle specifications and performance metrics. The case study demonstrates that the methodology can provide flexible, user-tailored recommendations, accommodating individual preferences through weighted criteria while ensuring that all functional requirements are sufficiently satisfied. The results highlight the framework's capability to rank alternatives robustly and transparently, offering a practical tool for supporting complex decision-making in EV selection and potentially other domains where uncertainty is a critical factor.

ÖZET

Bu derleme çalışmasında, literatürde yer alan bilimsel çalışmalardaki veriler ve öneriler çerçevesinde iş makinelerinde işletme şartlarında karşılaşılan başlıca hasar türleri, hasarların oluşum mekanizmaları ve öneriler değerlendirilmiştir. Yapılan araştırmalar, iş makinelerinde meydana gelen arızaların önemli bir kısmının kaynaklı bağlantılardan kaynaklandığını göstermektedir. Özellikle ekskavatör tipi iş makinaları, yoğun dinamik yükler, darbeli zorlanmalar ve zorlu çevresel koşullar altında çalışan kritik yapısal elemanlardır. Bu sistemlerin en kritik elemanlarından biri olan kaynaklı bağlantılar, yük aktarımında ve yapısal bütünlüğün korunmasında belirleyici bir rol oynayan kepçe gövdesini oluşturan çelik saclar arasındaki kaynaklı bağlantılarda yüksek gerilim yığılmalarına yol açmakta ve zamanla servis şartlarındaki yüklemelere rağmen hasar oluşturabilmektedir. Bununla birlikte kaynaklı birleştirmeler için uygun olmayan Kaynak Prosedür Şartnameleri (WPS'ler) veya kaynak prosesleri sürecinde yapılan işlem hataları, Tahribatsız Muayenenin (NDT) tam veya doğru uygulanmaması gibi faktörler hasarların önemli sebepleridir. Ayrıca, ürünün tasarımı sürecinde, yanlış malzeme seçimi veya şekillendirme sürecinde yapılan hatalar da iş makinalarında meydana gelen hasarların nedenlerindendir. Literatür verileri, ekskavatör bomları, bağlantı noktaları ve benzeri konstrüksiyon parçalarında görülen hasarların çoğunlukla kaynak kökenli yorulma çatlakları ile malzeme uyumsuzluklarından kaynaklandığını ve bu tür hasarların toplam arıza türleri içerisinde önemli bir paya sahip olduğunu ortaya koymaktadır. Bu çalışma ile iş makinelerindeki kaynaklı bağlantı güvenliğini artırmak amacıyla mevcut araştırmaların bütüncül bir bakış açısıyla derlenerek bilimsel bir veri kaynağının oluşturulması hedeflenmiştir.

Anahtar Kelimeler: İş Makineleri, Kaynaklı Bağlantılar, Hasar Analizi, Hasar Mekanizmaları.

FAILURES AND PREVENTION METHODS IN WELDED JOINTS OF CONSTRUCTION MACHINERY

ABSTRACT

In this research study, the main types of failures encountered in construction machinery under operating conditions, the mechanisms of failure formation, and recommendations were evaluated within the framework of scientific studies and data found in the literature. The research conducted shows that a significant percentage of failures occurring in construction machinery are caused by welded joints. Especially excavator-type construction machinery are critical structural elements operating under intense dynamic loads, impact stresses, and harsh environmental conditions. Welded joints, one of the most critical elements of these systems, cause high stress loads in the welded joints between the steel plates that form the bucket body, which plays a decisive role in load transfer and maintaining structural integrity, and can cause damage over time despite the loads under service conditions. However, factors such as Welding Procedure Specifications (WPS) that are not suitable for welded joints or faults in the welding process, such as the incomplete or incorrect application of Non-Destructive Testing (NDT) procedures, are significant causes of failures. Furthermore, wrong material selection during the product design process or faults made during the forming process are also causes of failures in construction machinery. Literature shows that failures in excavator booms, connection parts, and similar construction components are mostly caused by fatigue cracks originating from welding and material incompatibilities, and that such failures account for a significant percentage of total failure types. This study aims to create a scientific knowledge base by reviewing existing research from a comprehensive perspective in order to improve the safety of welded connections in construction machinery.

Keywords: Construction Machinery, Welded Joints, Failure Analysis, Failure Mechanisms.

1. GİRİŞ

Bilim ve teknolojinin gelişimi, insanoğlunun hem ihtiyaçlarını karşılamak hem de daha iyi yaşam koşulları oluşturmak için sürdürdüğü çabaların doğal bir sonucudur. Bu çabanın önemli bir parçası da, işlerin tehlikeli olduğu veya insan yeteneğinin gerekliliğinin azaldığı durumlarda üretim süreçlerini otomatikleştirme isteğidir. Geçmişten bu yana makinelerin ve tezgâhların insan müdahalesi olmadan çalışabilmesi hedeflenmiş olsa da, bu hedefi gerçekleştirmek uzun süre mümkün olmamıştır. Çünkü insanın yeni durumlara uyum sağlama, beklenmeyen koşulları algılama, analiz etme ve makul sonuçlara ulaşma konusundaki üstün yetenekleri, günümüz teknolojisinin dahi tam anlamıyla taklit edemediği özelliklerdir. Bununla birlikte, günümüzde insan tarafından yapılabilen birçok görev, artık elektromekanik ve hidromekanik sistemler tarafından başarıyla yerine getirilebilmektedir. Robotlar ve iş makineleri pek çok imalat faaliyetinin ayrılmaz bir parçası hâline gelmiş, üretim süreçlerinde yaygın olarak kullanılmaya başlanmıştır [1].

Ancak piyasa koşullarındaki dışa bağımlılık ve özellikle döviz kurlarındaki dalgalanmaların artması, iş makineleri kullanıcılarını ve yedek parça tedarikçilerini olumsuz etkilemektedir. Bu ekonomik koşullar altında en rasyonel yaklaşım, mevcut iş makinelerinin ve parçalarının kullanım ömrünü uzatmak, oluşabilecek hasarları erken aşamada tespit ederek büyümeden önlem almaktır [2]. Çünkü hasar, bir yapı ya da elemanın kendisinden beklenen işlevi yerine getiremeyecek hâle gelmesi olarak tanımlanır ve temelde elemanın aşırı zorlanması sonucunda ortaya çıkar. Bu zorlanma iki temel nedenden kaynaklanır: Elemanın dayanımının gerekli düzeyin altında olması veya elemana etki eden yüklerin, elemanın taşıyabileceği sınırları aşması. Dolayısıyla, hasarın doğru analiz edilmesi ve önleyici yaklaşımların benimsenmesi, hem makine verimliliğinin korunması hem de ekonomik kayıpların en aza indirilmesi açısından kritik öneme sahiptir [2,3].

1.1. Hasar ve Hasar Analizi

Hasar, bir yapının veya yapı elemanının kendisinden beklenen performans kriterlerini karşılayamaz hâle gelmesi olarak tanımlanır ve genellikle yapının tasarım, imalat, montaj ya da işletme aşamalarından herhangi birinde ortaya çıkan teknolojik hataların bir sonucudur. Tasarım aşamasında hatalar; hesaplama yetersizlikleri, yanlış mühendislik varsayımları ve uygun olmayan malzeme seçimi gibi unsurları içerir ve bu aşamadaki sorumluluk tasarımcıya aittir. İmalat sürecinde görülen teknolojik kusurlar ise üretim parametrelerindeki uygunsuzluklar ile malzemenin içsel yapısında bulunan hataları kapsar; bu kapsamda sorumluluk üreticiye aittir. Yapının veya sistemin birleştirilmesi sırasında meydana gelen yanlış uygulamalar montaj hatası olarak adlandırılır ve bundan montajı yapanlar sorumludur. İşletme safhasında karşılaşılan hatalar ise çoğunlukla aşırı zorlanma, yanlış kullanım veya yetersiz bakım faaliyetlerinden kaynaklanır ve bu durumun sorumluluğu işletmeciye aittir. Bu aşamaların herhangi birinde yapılan hatalar, zamanla ilerleyerek yapısal bütünlüğün bozulmasına ve nihai olarak elemanın işlev kaybına neden olabilmektedir [5].

Parçalarda oluşan hasarların tamamen önlenmesi ise mümkün değildir [5].

- Hasar Türleri

Hasarın sınıflandırılması farklı yaklaşımlara göre değişiklik gösterebilmekte olup, kullanılan sınıflandırma sistemine bağlı olarak malzemelerde ortaya çıkan fiziksel hasarlar çeşitli kategoriler altında incelenmektedir. Hasarın tanımlanması, nedenlerinin ortaya çıkarılması ve buna bağlı olarak uygun önleyici tedbirlerin belirlenmesi amacıyla hasar türleri genel olarak şu biçimde gruplandırılabilir: distorsiyon ve deformasyonlar, korozyon, sürünmeye bağlı hasarlar, aşınma, yorulma, imalat aşamasından kaynaklanan hatalar (döküm, metal dışı kalınlı, ısıl işlem,

hadde, montaj). Bu tür hasarlar, farklı temel hasar mekanizmalarını içermekte olup, pek çok durumda iki veya daha fazla mekanizmanın aynı hasar üzerinde eşzamanlı olarak etkili olabileceği de göz önünde bulundurulmalıdır [5].

- Hasar Analizi ve Aşamaları

Hasar analizi, bir bileşen ya da sistemde meydana gelen hasarın nedenlerini ortaya koymak amacıyla hasara ilişkin bulguların sistematik biçimde toplanması, değerlendirilmesi ve yorumlanmasının yanı sıra sonuçların raporlanmasını içeren kapsamlı bir inceleme sürecidir. Bu süreç sayesinde hasarın oluşum mekanizmaları ayrıntılı olarak anlaşılır ve benzer türdeki arızaların gelecekte ortaya çıkmasını engellemek için gerekli mühendislik önlemlerinin belirlenmesi mümkün olur. Ayrıca yürütülen hasar analizi çalışmaları ile sistemlerin ve ürünlerin kalite düzeyindeki gelişmeler izlenebilir ve üretim süreçlerine yönelik iyileştirmeler takip edilebilir [6].

Hasar analizi ile elde edilen bulgular doğrultusunda, benzer yapılar veya sistemler için gelecekte yürütülecek tasarım, imalat ve kalite kontrol faaliyetlerinde aynı tür hasarların tekrar oluşmasını engelleyecek mühendislik tedbirlerinin geliştirilmesi amaçlanır. Bu yönüyle hasar analizi, yalnızca mevcut bir arızanın nedenlerini ortaya çıkarmakla kalmayıp aynı zamanda üretim süreçlerinin ve tasarım yaklaşımlarının iyileştirilmesine katkı sağlayan önemli bir geri bildirim mekanizması işlevi görür [4].

Her ne kadar uygulanacak inceleme basamakları hasarın niteliğine, yayılma biçimine ve meydana geldiği çalışma koşullarına bağlı olarak değişiklik gösterebilse de hasar analizi genel olarak Şekil 1'de de özetlenebileceği belirli temel aşamalar çerçevesinde yürütülür. Bu temel adımlar şu şekilde özetlenebilir [7]:

1. **Hasarın net biçimde tanımlanması:** Hasarın kapsamı, şiddeti, oluşan deformasyon türü ve etkilediği bileşenlerin net olarak ortaya konulması.

2. **Geçmişe yönelik bilgi toplanması ve uygun numunelerin seçilmesi:** Üretim kayıtları, kullanım koşulları, bakım geçmişi gibi verilere ulaşılması ve incelemeye esas teşkil edecek örneklerin belirlenmesi.

3. **Hasarlı elemanın ön incelemesi:** Parçanın makro düzeyde gözlemlenmesi, yüzeydeki bozulmaların değerlendirilmesi ve sonraki analizler için gerekli hazırlıkların yapılması.

4. **Hasarlı parçaların ayrıntılı analizi:** Mikroskobik incelemeler, mekanik testler, kimyasal analizler ve gerekli diğer mühendislik yöntemleri aracılığıyla hasarın mekanizmalarının belirlenmesi.

5. **Elde edilen bulguların değerlendirilmesi, yorumlanması ve nihai hasar raporunun oluşturulması:** Analiz sonuçlarının bütüncül bir yaklaşımla yorumlanarak hasarın asli nedeninin ortaya konulması ve çözüm önerilerinin raporlanması.

Şekil 1. Hasar Yolu ve Hasar Analizi Yolu [4]

1.2. Kaynaklı Bağlantılarda Hasar Analizi

Literatürde gerçekleştirilen incelemelerin önemli bir bölümünde, kaynaklı birleştirmelerde ortaya çıkan hasarların temel nedeninin, çoğunlukla uygulanan kaynak işlemi sırasında yapılan hatalar ile ana malzeme ve kaynak metali arasındaki uyumsuzluklardan kaynaklandığı ifade edilmektedir. Kaynak bölgesinde meydana gelen bu tür uyumsuzluklar; metalurjik yapı farklılıkları, ısı girdisinin uygun kontrol edilememesi, soğuma hızındaki dengesizlikler ve kaynak metali ile esas malzemenin mekanik veya kimyasal özelliklerinin birbiriyle örtüşmemesi gibi çeşitli faktörlerin birleşimiyle ortaya çıkmaktadır. Bu durumun en belirgin sebeplerinden biri ise kaynağın geometrik tasarımına ilişkin değişkenlerin çok geniş bir aralıkta bulunması ve uygulamada bu parametrelerin gereksinimlere uygun şekilde seçilememesidir. Kaynak dikişinin şekli, kaynak hazırlığı, alın veya köşe birleşim geometrileri, nüfuziyet derinliği ve ısı girdisi gibi tasarımsal unsurlardaki yanlış seçimler; birleştirme bölgesinde gerilme yığılmalarına, düzensiz mikro yapıya ve nihayetinde hasara zemin hazırlayan zayıf bölgelerin oluşmasına neden olabilmektedir. Dolayısıyla, kaynak parametrelerinin doğru belirlenememesi yalnızca uygulama hatalarına yol açmakla kalmayıp, aynı zamanda kaynak bölgesinin bütünlüğünü ve uzun dönem performansını olumsuz etkileyen kritik bir unsur hâline gelmektedir [8,9].

Kaynaklı birleştirmelerde gerçekleştirilen hasar analizi genel olarak iki temel aşamadan oluşmaktadır. İlk aşama, hasarın kaynağını belirlemeye yönelik olarak hasarlı bölgenin ayrıntılı biçimde incelenmesini ve parçanın karakteristik özelliklerinin ortaya konulmasını içerir. Bu aşamada amaç, hasara yol açan hatanın doğru bir şekilde tanımlanması ve söz konusu hatanın kaynaklı bağlantı bölgesinde hangi mekanizmalar sonucu ortaya çıktığının anlaşılmasıdır. Kaynaklı bağlantılarda hata nedenini belirlemek için öncelikle görsel muayene, ışık mikroskopisi, tahribatsız muayene yöntemleri ve diğer malzeme testleri dâhil olmak üzere hasar analiz tekniklerinden yararlanılır. Bunlara ek olarak, bağlantı noktasında oluşan gerilmelerin analitik olarak değerlendirilmesi ve gerekli durumlarda uygun numuneler üzerinden detaylı incelemelerin yapılması önem taşır [8].

İlk bulguların ardından, daha detaylı incelemeler için ışık mikroskobunun yanı sıra taramalı veya geçirimli elektron mikroskobu gibi ileri mikroskobik teknikler de kullanılabilir. Elektron mikroskobu, mikro yapıdaki ince detayların görünür hâle getirilmesi sayesinde çatlak başlangıç bölgeleri, tane sınırı davranışları, faz dağılımı ve malzeme homojenliği gibi kritik parametrelerin daha hassas bir şekilde değerlendirilmesine olanak sağlar. Mikroskobik analizlere ek olarak yapılan kimyasal kompozisyon incelemeleri, kaynak metali ile esas malzeme arasındaki farklılıkların belirlenmesinde ve hasarın oluşum mekanizmasının doğru

yorumlanmasında önemli rol oynar. Bu kapsamlı değerlendirmeler sayesinde hasar bölgesinin tam anlamıyla anlaşılması mümkün olmakta ve hasarın altında yatan temel sebepler bilimsel olarak güvenilir biçimde ortaya konulmaktadır [8,10].

Hasar analizi sürecinin ikinci aşaması, benzer hasarların gelecekte tekrar ortaya çıkmasını engellemek amacıyla yapılan değerlendirmeleri, elde edilen sonuçların bütüncül biçimde analiz edilmesini ve nihai hasar raporunun hazırlanmasını kapsamaktadır. Bu aşamada öncelikle hasarın açık, anlaşılır ve teknik olarak doğru bir tanımının yapılması gerekir. Hasar göstergeleri, hasarın temel nedeni ve hasarın gelişiminde rol oynayan mekanizma arasındaki ayrımlar net bir biçimde ortaya konulmalıdır [10]. Bu nedenle mevcut durumun tüm bileşenleri dikkatle değerlendirilerek olası hasar göstergeleri ile hasar mekanizmaları doğru şekilde tanımlanmalıdır.

Kaynaklı bağlantılarda bu aşamanın sağlıklı yürütülebilmesi için, birleştirmede hasara yol açabilecek kusurların kapsamlı biçimde bilinmesi gereklidir. Kaynaklı yapılarda hasar çoğu zaman aşırı yüklenme ile teknolojik hataların birlikte etkimesi sonucu oluşsa da, temel belirleyici etkenin teknolojik hatalar olduğu bilinmektedir. Bu nedenle, hasarın kökenini açıklığa kavuşturabilmek için parçada ortaya çıkan bozulmanın hangi teknolojik hata türüyle ilişkili olduğunun doğru biçimde tespit edilmesi zorunludur. Nitekim kaynaklı birleştirmelerde hasar, tek bir hatadan kaynaklanabileceği gibi birden fazla teknolojik hatanın eşzamanlı etkisiyle de meydana gelebilir [4,11].

Teknolojik hatalar genel olarak üç ana kategori altında incelenmektedir [12]:

1. **Tasarım kaynaklı hatalar** (tasarım kusurları ve yanlış malzeme seçimi),
2. **Üretim ve tesis aşamasında ortaya çıkan hatalar** (imalat ve montaj hataları),
3. **Uygun olmayan servis ve çalışma koşullarına bağlı hatalar**.

Bu hatalar, hasar türlerinden biriyle ya da birkaçıyla ilişkili olarak hasarın ortaya çıkmasına neden olabilir. Aşırı zorlanma dışında kalan tüm nedenler teknolojik hata kapsamında değerlendirilir. Dolayısıyla teknolojik hatanın doğru şekilde tanımlanabilmesi için, öncelikle hasarın başladığı bölgenin, yani hasarı başlatan kritik noktanın tespit edilmesi gerekmektedir [11].

1.3. İş Makinelerinde Kaynaklı Bağlantının Önemi

İş makineleri, yol, liman, baraj, kanal vb. Alt yapıların hazırlanması, her çeşit kazı, yükleme, kırma işlemlerinin yapılması gibi birçok alanda kullanılmaktadır. Çalışma alanları ve yaptıkları işe, performanslarına göre çok farklı modellere ayrılmaktadır [13].

İş makineleri çalışma koşulları gereği uzun süreli ve döngüsel yüklemelere maruz kalan ekipmanlardır. Bu tür makinelerde, nominal gerilme seviyelerini artırarak gerilme yığılmasına neden olabilen bağlantı detayları kullanılmaktadır. Özellikle yaygın bir şekilde tercih edilen köşe ve punta kaynakları, bu bağlantıların başında gelir. Ağır ve sürekli yüklemelere maruz kalan iş makinelerinde, söz konusu kaynak bölgelerinde çatlak başlangıcı ve ilerlemesi olağan bir durumdur. Bu nedenle, bu tür makinelerin tasarım sürecinde kaynaklı birleştirme noktalarında ortaya çıkabilecek yorulma ve kırılma mekanizmalarının dikkatle değerlendirilmesi büyük önem taşımaktadır.

Derleme niteliğindeki bu çalışmada iş makinelerinde meydana gelen genel hasar türleri, hasar mekanizmaları, literatürde belirtilen örnek vakalar ve bu hasarların önlenmesine yönelik öneriler detaylı biçimde ele alınmıştır.

2. ESKAVATÖRLERDE GENEL HASAR TÜRLERİ VE NEDENLERİ

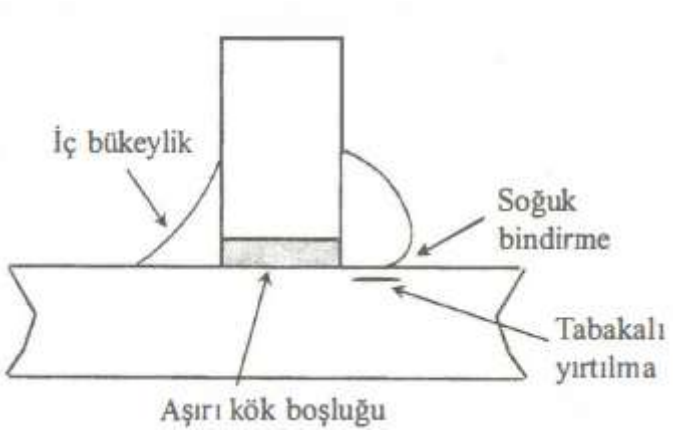
Ekskavatör tipi iş makinelerinde karşılaşılan hasarlar; tasarım, üretim, servis koşulları, kaynak bağlantı kalitesi ve kusurlarının etkisiyle ortaya çıkar. Bilindiği gibi, uygulanan yük birçok faktöre bağlı olarak değişkendir ve bu durum, kritik noktalarda tespit edilen yüksek gerilim yoğunlaşmasıyla birlikte, yapı yıkım sürecini anlamanın anahtarı haline gelir. Kırılma meydana geldiğinden, çatlak başlangıcının bir çentiğe nasıl aktarıldığı çok önemlidir; bu da ekskavatörün yapısındaki yük aktarımının kötü bir tasarıma sahip olduğunu gösterir. Böylece, uygulanan yük ve gerilim dağılımının kırılma mekanizması üzerindeki etkileri büyük önem taşımaktadır [14].

Ekskavatör tasarımının önemli bir yönü, kaynaklı çelik yapıların yorulma ve kırılma davranışıdır [15,16,17]. Üretimden kaynaklanan kusurlar ve heterojen mikro yapı (ana metal, kaynak metali, ısının tesiri altındaki bölge- ITAB) nedeniyle kaynaklı bağlantılar, çatlak başlangıcı ve büyümesi açısından en kritik parçalardır ve iş makinelerinde olduğu gibi değişken yükleme ve yorulmaya maruz kaldıklarında özel dikkat gerektirir [14].

Gerçekten de yorulma hasarının, bir makinenin hizmet ömrü boyunca meydana gelen arızaların yaklaşık yüzde seksenini (%80) oluşturduğu tahmin edilmektedir.

2.1. Yorulma

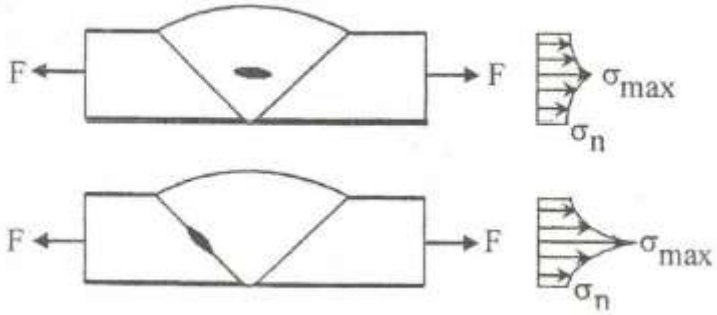
Yorulma hasar türü, tekrarlı yüklemelere maruz kaynaklı makine parçalarında ve/veya yapılarda oluşan hasarların birincil nedenidir. Hasar analizleri sonuçlarından, imal edilen çelik yapılarda yorulma çatlağının çoğu kez gerilim yığılmasının yüksek olduğu çentik etkisine sahip kaynak geometrilerinden başladığı anlaşılmıştır. Ayrıca gerilim yığılmasının oluştuğu noktaların dışında, bağlantının yorulma özelliklerine etkileyen çok sayıda faktör bulunduğundan kaynak bağlantısı ana metale göre daha düşük yorulma dayanımına sahiptir. Kalıntı çekme gerilmesinin büyüklüğü, ısının tesiri altındaki bölgenin (ITAB) mikro-yapısal etkisi diğer önemli parametreleri oluşturmaktadır. Kaynak bağlantısının yorulma özelliklerinin iyileştirilmesi, ITAB 'ın dayanımının toklukta düşüşe yol açmadan arttırılması, bağlantıdaki çekme kalıntı gerilmesinin ve çentik etkisinin azaltılmasıyla ilgili olduğu söylenebilir [18].



2.2. Aşırı Yükleme

Aşırı yükleme hasar türü genellikle parçanın çalışma şekli darbeli ve ani yüklemelere maruz olduğu şartlarda meydana gelmektedir. Hasar türünün isminden de anlaşılacağı üzere yapının aşırı yükleme şartlarında çalışma nedeniyle meydana gelir. Bu yükleme ve saha koşullarında çalışan parçalarda, malzemenin dayanımı tasarım aşamasında yeterince yüksek seçilmektedir. Diğer bir deyişle seçilen malzemenin darbe enerjisi ve eğme dayanımı yüksektir [6].

Malzemenin hesaplanan dayanım değerinin üzerinde bir gerilmenin oluştuğunda meydana gelen aşırı yükleme şartları ile zorunlu kırılma meydana gelmektedir. Bu tip kırılmalarda kırık yüzey incelemesinde gevrek kırılmadan ziyade ayrılma kırılması (zorunlu kırılma) türü, kırık yüzeyi tanecikli bir görünüş gösterir. Ayrılma veya zorunlu kırılma; plastik deformasyon oluşumu yerine atomlar arası bağların kopması şeklinde ortaya çıkmaktadır [6].



2.3. Kaynak Hataları

Kaynak hataları yerel gerilim yığılmasına ve kalıntı gerilmelere yol açabilmektedir. Genellikle bütün kaynaklı birleştirmeler farklı büyüklüklerde de olsa hata içermektedir. Kaynak prosesine ait değişkenlerin uygun seçilmemesi doğrudan ya da dolaylı olarak bağlantıda kaynak hatalarına neden olmaktadır [18]. Bu hatalar tek boyutlu ve düzlemsel olabildiği gibi farklı geometride hacimsel süreksizliklerden de oluşabilmektedir. Şekil 2 'de şematik olarak kaynak dikişi ve etrafında başlıca oluşabilecek kaynak hataları şematik olarak verilmiştir [19].

Şekil 2. Kaynak hataları ve gerilme yığılmasına yol açan diğer süreksizlikler [19].

Düzlemsel hata olarak göz önüne alabileceğimiz, hidrojen çatlağı, tabakalı yırtılma, nüfuziyet eksikliği ve katılaşma çatlağı, çatlak başlangıç noktalarını oluşturabilmektedirler. Hatanın konumu, büyüklüğü ve zorlanma altındaki kuvvet akış çizgilerinin yönlenmesi bağlantıda doğacak çentik etkisinin büyüklüğünü belirleyecektir (Şekil 3) [3].

Şekil 3. Kuvvet doğrultusunda ve çapraz konumdaki hatanın neden olduğu gerilme yığılması (şematik) [3].

3. LİTERATÜR TARAMASI

Bu bölümde, kaynaklı birleştirmelerde görülen hasar mekanizmaları ve bu hasarların analizi üzerine yapılan çalışmalar incelenmiştir. Literatür taraması, mevcut araştırmaların kapsamını, yöntemlerini ve elde edilen bulgularını ortaya koyarak bu çalışmanın bilimsel temelini oluşturmayı amaçlamaktadır.

Maury ve ekibi, hidrolik bir ekskavatör bomunda meydana gelen katastrofik kırılmanın nedenlerini araştırmak üzere kapsamlı bir hasar analizi gerçekleştirmiştir. Çalışmada, saha incelemeleri, tahribatsız muayeneler, makro ve mikro metalografik incelemeler, kimyasal analizler, sertlik ölçümleri ve sonlu elemanlar analizi gibi çok yönlü yöntemler kullanılmıştır. İnceleme sonucunda çatlağın, bom levhası ile man-hole plakasının birleştirildiği kaynak dikişi bölgesinde başladığı tespit edilmiştir. Kırık yüzeyindeki yorulma izleri (beach marks/ kumsal izleri) hasarın zaman içerisinde tekrarlı yükler altında geliştiğini göstermektedir [20].

Çalışmanın önemli bulgularından biri, bakım sürecinde sonradan eklenen man-hole plakasının malzeme özelliklerinin, ana taşıyıcı bom malzemesi ile tam olarak uyuşmadığıdır. Bu uyumsuzluk, bileşimin ve mikro yapının farklı olması nedeniyle bölgesel mekanik dayanımı düşürerek çatlak oluşumuna zemin hazırlamıştır. Bunun yanında, termal kesme sırasında plaka üzerinde oluştuğu düşünülen yüzey olukları ve düzensizliklerin giderilmeden kaynak işlemine

geçilmesi, bu bölgelerde belirgin gerilme yığılmalarına sebep olmuştur. İncelemelerde kaynak metalinde oksit ve cüruf kalıntısı bulunması, elektrot hazırlığı ve ön ısıtma/ara paso sıcaklığı kontrolünün yetersiz olduğunu ortaya koymaktadır. Bu durum, kaynak bölgesinde martensitik ve gevrek bir yapının oluşmasına ve tokluğun önemli ölçüde azalmasına yol açmıştır [20].

Sonlu elemanlar analizinden elde edilen sonuçlar, teorik olarak en yüksek gerilme bölgelerinin yapının başka noktalarında bulunmasına rağmen, gerçek kırılmanın düşük kaliteli kaynak bölgesindeki yerel kusurlar nedeniyle çok daha erken ortaya çıktığını göstermektedir. Yaklaşık 40.000 saatlik çalışma sonunda meydana gelen bu beklenmeyen kırılma, malzeme uyumsuzluğu, yüzey süreksizlikleri, yetersiz kaynak kalitesi ve uygun olmayan bakım-onarım uygulamalarının birleşik etkisiyle gelişen yorulma hasarının bir sonucu olarak değerlendirilmiştir.

Ferhan Fıçıcı ve çalışma arkadaşları, Hidromek 220LC-2 model ekskavatörün bomu için parametrik bir üç boyutlu sonlu elemanlar modeli oluşturulmuş ve bom üzerindeki kritik bölgelerdeki gerilme dağılımları detaylı bir şekilde incelenmiştir. Araştırmacılar, özellikle kaynaklı bölgelerdeki gerilim yoğunlaşmalarının, yorulma çatlaklarının temel nedeni olduğunu bildirdi. Geliştirilen model aracılığıyla bomun çeşitli noktalarında eşdeğer Von Mises gerilmeleri hesaplanmış ve bu bölgelerdeki gerilme seviyeleri dikkate alınarak Goodman kriteri ile yorulma ömrü tahminleri yapılmıştır [21].

Tablo 1. Çevrim Sayıları [21]

		1	2	3	4
Se = 47 MPa	N	172573	308987	217660	251934
Se = 53 MPa	N	227144	419529	290057	338360

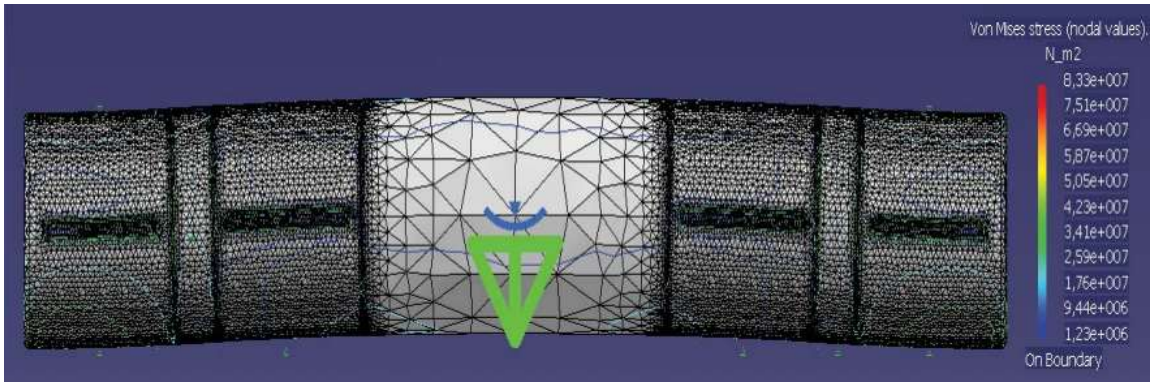
Tablo 1'de elde edilen çevrim sayıları ekskavatör bomu alt sacının kalınlığı 3mm arttırılarak tekrar hesaplanmıştır. Yeni sac kalınlığı için elde edilen değerler ve çevrim sayısındaki yüzde artış Tablo 2'de verilmiştir [21].

Tablo 2. Çevrim Sayıları ve Ömürde Yüzde Artışlar [21]

		1	2	3	4
Se = 47 MPa	N	176518	334554	285846	325743
	Yüzde Artış	2,29%	8,27%	31,33%	29,30%
Se = 53 MPa	N	232617	456173	386500	443527
	Yüzde Artış	2,41%	8,73%	33,25%	31,08%

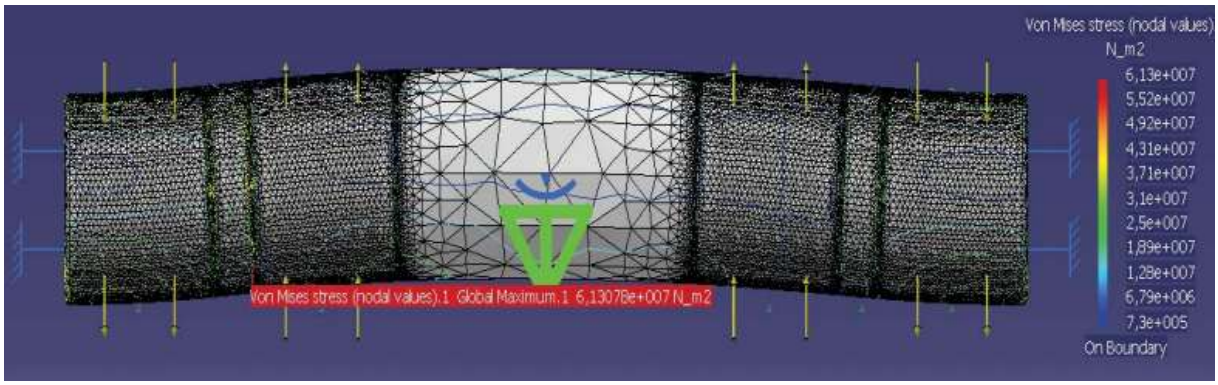
Bu tabloda da görülebileceği gibi sac kalınlığındaki artış ile %2,29'luk bir ömür artışı elde etmek mümkün olmaktadır. Bu sonuç, küçük tasarım değişikliklerinin bile yorulma dayanımını önemli ölçüde etkileyebileceğini göstermektedir [21].

M. Bošnjak ve arkadaşları bir tekerlekli ekskavatörün (BWE) kovasında meydana gelen hasarın incelemesini gerçekleştirmiştir. Araştırma kapsamında malzeme özelliklerini analiz etmek için kimyasal analiz testleri, sertlik ölçümleri ve gerinim ölçümü gibi deneysel testleri içeren bir hasar analizi metodolojisi yolu izlenmiştir. Ardından bu deneysel veriler farklı yük koşulları altında kepçe üzerindeki gerilim durumlarını hesaplamak üzere Doğrusal



Sonlu Elemanlar Yöntemi (LFEM) ile birleştirilmiştir. Çalışmada hasara neden olan mekanizmaları belirlemek amacıyla deneysel olarak belirlenen çalışma ve kalıntı gerilmelerin üst üste bindirilmesi ve toplam asal gerilmelerin hesaplanması yaklaşımı kullanılmıştır. Elde edilen veriler sonucunda hasarın; hatalı malzeme seçimi ve kusurlu geometrik şekillendirme gibi tasarım kaynaklı hatalardan meydana geldiği gözlemlenmiştir. Bununla birlikte yapıda bulunan kalıntı gerilmeler ve kaynakta bulunan soğuk çatlaklar gibi üretim kaynaklı hatalar da yorulma çatlaklarının oluşmasına ve beraberinde ekskavatör kovalarının hasara uğramasına neden olmuştur [22].

A. Öndürücü ve Ö. Kandbir, bir greyderin dişli rotunda meydana gelen hasarın nedenini araştırmıştır. Hasarlı parçanın kimyasal analizi gerçekleştirilmiş ve malzeme bilgisi **St52 (S355) çeliği** olarak belirlenmiştir. Malzemenin mekanik özelliklerini belirlemek amacıyla sertlik, çentik darbe ve üç nokta eğme testleri gerçekleştirilmiştir. Metalografik incelemeler optik mikroskop ve Taramalı Elektron Mikroskobu (SEM) ile gerçekleştirilmiş, kırılmanın sünek kırılma yapısı gösterdiği gözlemlenmiştir. Parçanın ayrıca sonlu elemanlar modeli oluşturularak analizi yapılmıştır. Analizler sonucunda, parçanın hasara uğramasının temel nedeni olarak çalışma şartları nedeniyle aşırı zorlanma ve darbe yüklemesi olarak belirlenmiştir. Meydana gelen kırılmanın ise malzeme dayanımının üzerinde bir gerilme oluşması sonucu meydana gelen Ayrılma kırılması veya zorunlu kırılma olduğu ve hasarın gerilim yığılmasının beklendiği birleşme noktasında gerçekleştiği görülmüştür [6].



M. Makaracı ve çalışma arkadaşları, direksiyon sisteminin önemli parçası olan direksiyon aksonunun statik yükler altındaki davranışını incelemiştir. Bu çalışmada 3 boyutlu geometriye sahip akson modeli ile aksonun gerilme analizleri, darbe yükü, acil frenleme ve kaygan zemin koşulları gibi zorlu saha çalışma senaryolarında Sonlu Elemanlar Metodu (FEM) kullanılarak gerçekleştirilmiş. Malzeme olarak QT500-7 küresel dökme demir kullanılmıştır. Analizlerin sonucunda ise en yüksek gerilmenin malzemenin akma mukavemeti olan 320 MPa değerinin altında olduğu ve statik olarak bu durumun güvenli olduğu tespit edilmiştir. Bununla birlikte araştırmacılar asıl hasarın yorulma sonucunda gerçekleşebileceğini belirtmiş olup bu nedenle de yorulma testinin de yapılmasının gerekliliğini belirtmiştir [23].

Dudziński ve arkadaşları, çalışmalarında bir ekskavatörün bom süspansiyonunda meydana gelen hasarın kök neden analizini gerçekleştirmiştir. Bu hasar makinenin performansında ciddi aksamalara ve uzun süreli hizmet dışı kalmaya bağlı oldukça yüksek finansal kayıplara neden olmuştur. Gerçekleştirilen metalografik incelemeler ve Sonlu Elemanlar Yöntemi (FEM) ile analizlerle hasarın üç faktörün birleşimi sonucu oluşan bir yorulma kırılması olduğu ortaya konmuştur. İlk olarak aksın malzemesinin, nicel olarak yüksek yüklere maruz kalan taşıyıcı yapılar için uygun olmayan, Widmanstätten yapısına sahip homojen olmayan ferritik ve perlitik bir mikroyapı sergilediği görülmüştür. Bu durum temin edilen malzemenin, analiz bilgilerini içeren sertifikasındaki gereksinimleri karşılamadığını refere etmektedir. İkinci olarak yorulma çatlağının başlama noktasının, eksende bir yapısal çentik üzerinde olduğu belirlenmiştir ek olarak deforme olmuş bir segmanının ek eğilme kuvvetleri oluşturarak kırılma bölgesinde gerilim konsantrasyonunu artırdığı da görülmüştür. Bu durum ilgili bölgede akma mukavemetini aşan düşük çevrimli yorulma gerilimine yol açmıştır. Son olarak ise makine üzerinde gerçekleştirilen deneysel ölçümler, maksimum yüklerin teorik tasarım yüklerinden %18 daha yüksek olduğunu göstermiştir. Düzeltici aksiyon olarak, aksın tasarımının tamamen yeniden düzenlenmesi gerçekleştirilmiş ve uygun Widmanstätten yapısı içermeyen mikroyapıya sahip 40HM çeliği kullanılmıştır. Bunun sonucunda tasarım FEM ile doğrulanmıştır ve maksimum gerilimlerin malzemenin yorulma mukavemeti sınırının altında kaldığını ve mukavemetini önemli ölçüde arttırdığı raporlanmıştır [24].

Demiralp ve Türkeş, gerçekleştirdikleri çalışmalarında bir ekskavatörün kova-arm bağlantısını sağlayan SAE 8620 çeliğinden imal edilen piminin yorulma dayanımını üç boyutlu sonlu elemanlar modeli ile incelemiştir. Pim üzerindeki kanallar yağlamanın daha sağlıklı yapılması için açılmışken çentik etkisi göz önüne alınmamıştır. Yağlama kanalları (Şekil 4) pimin ömrünün daha kısa olmasına ve yorularak kırılmasına yol açmaktadır. Başka bir deyişle, yağlama kanalları pimin ömrünü kısaltmakta ve yorulma kırılmasına neden olmaktadır. Araştırmacılar yeni bir tasarımla yağlama kanallarını kaldırarak düz pim tasarımı yapmış (Şekil 5), aynı koşullar altında analizi tekrarlayarak sonucunda pim üzerindeki en yüksek gerilimin üçte bir değerinde düşüş gerçekleştiğini gözlemlemiştir. Pim üzerindeki kanallar burca taşınarak yağlama görevini meydana getirmesi sağlanmış olup yorulma ömrü artmıştır. Her iki makine de aynı arazi koşullarında çalıştırıldığında, kanallı pimli ekskavatör on bir bin (11.000) saatlik çalışmadan sonra yorulma nedeniyle kırılırken, düz pimli ekskavatör on sekiz bin (18.000) saatlik çalışmadan sonra yorulma nedeniyle kırılmaktadır. Ayrıca düz pim üretiminin hem kolay hem de uygun maliyetli olduğu belirtilmektedir [25].

Şekil 4. Kanallı Pim Üzerindeki Eşdeğer Gerilmeler [25]

Şekil 5. Düz Pim Üzerindeki Eşdeğer Gerilmeler [25]

-Hasar Önleme Çareleri

İş makinelerinde meydana gelen hasarın doğru analiz edilmesi ve proaktif yaklaşımların benimsenmesi hem makinenin performans verimliliği için hem de ekonomik kayıpların en aza indirilmesi için günümüzde önemini korumaktadır. Mevcut durumda iş makinelerinin ve makine parçalarının kullanım ömrünü uzatmak ve meydana gelebilecek hasarları mümkün olan en temel aşamada tespit etmek hasarın büyümeden önlenmesi yaklaşımıdır.

Parçalarda oluşan hasarların tamamen önlenmesi mümkün olmasa da iş makinelerinde özellikle kaynaklı bağlantılarında meydana gelen hasarların önüne geçmek için tasarım, üretim ve işletme aşamalarında mühendislik aksiyonları alınmalıdır [5]. Kaynaklı birleşimlerde hasarın

temel nedeni, çoğunlukla uygulanan kaynak işlemi sırasında yapılan hatalar ile ana malzeme ve kaynak metali arasındaki uyumsuzluklardan kaynaklandığı görülmektedir.

Bu tür hataların ve hasarların önlenmesi için, her bir birleşim için uygun Kaynak Prosedür Şartnamesi (WPS) hazırlanmalıdır. Kaynak işlemi sonrası Tahribatsız Muayene (NDT) gerçekleştirilmelidir. Ayrıca kritik olarak belirlenen kaynak bölgelerinde nüfuziyet kontrolü, uygun ısı girdisi ve paso arası sıcaklık kontrolü uygulanmalıdır. Isı girdisinin uygun kontrol edilememesi ve soğuma hızındaki dengesizlikler metalurjik yapı farklılıklarına yol açar [20]. Kaynak parametreleri, malzeme mikro yapısını kontrol edecek şekilde optimize edilmelidir ve Isının Tesiri Altındaki Bölge (ITAB) genişliği ve sertlik dağılımı düzenli olarak ölçülmelidir.

Tasarım aşamasında malzemenin dayanımı, özellikle darbe enerjisi ve eğme dayanımı yüksek olacak şekilde yeterince yüksek seçilmelidir. Hasara neden olan hatalı malzeme seçimi ve kusurlu geometrik şekillendirme gibi tasarım kaynaklı hatalardan kaçınılmalıdır [6]. Bakım onarım sürecinde eklenen parçaların malzeme özelliklerinin, ana malzeme ile tam olarak uyuşmaması nedeniyle bu uyumsuzluk bölgesel dayanımı düşürerek çatlak oluşuma yol açar [20].

Tasarımsal unsurlardaki yanlış seçimler (kaynak dikişinin şekli, nüfuziyet derinliği vb.) gerilim yığılmalarına ve mukavemet açısından zayıf bölgelere neden olabilir. Yağlama kanalları gibi çentik etkisi yaratan detaylar, pimin ömrünü kısaltıp yorulma kırılmasına neden olabilir; bu kanalların burca taşınması gibi tasarımsal çözümler yorulma ömrünü önemli ölçüde artırmıştır. (11.000 saatten 18.000 saate çıkış) [25].

4. SONUÇ

Bu derleme çalışmasında literatürde bulunan çalışmalar kapsamında iş makinelerinde işletme şartlarında karşılaşılan başlıca hasar türleri, hasarların oluşum nedenleri ve önleyici öneriler alt başlıklar halinde değerlendirilmiştir. Yapılan araştırmalar, iş makinelerinde meydana gelen hasarların önemli bir kısmının kaynaklı bağlantı esaslı olduğunu kaynaklandığını göstermektedir. Özellikle ekskavatör tipi iş makinaları yoğun dinamik yükler, darbeli zorlanmalar ve zorlu çevresel koşullar altında çalışan kritik yapısal elemanlardır.

Literatür verileri ekskavatör bomları, bağlantı noktaları ve benzeri konstrüksiyon parçalarında görülen hasarların çoğunlukla kaynak nedeniyle yorulma çatlaklarından kaynaklandığını ortaya koymaktadır. Yorulma hasarı, tekrarlı yüklemelere maruz kalan kaynaklı makine parçalarında birincil hasar nedenidir. Tahminlere göre, bir makinenin hizmet ömrü boyunca meydana gelen arızaların yaklaşık yüzde sekseni (%80) yorulma hasarından oluşmaktadır.

Hasarlar genellikle tasarım kaynaklı hatalar (yanlış malzeme seçimi, tasarım kusurları), üretim ve tesis aşamasında ortaya çıkan hatalar (kaynak proses hataları, eksik nüfuziyet, cüruf kalıntıları) ve uygun olmayan servis koşullarına bağlı hatalar (aşırı zorlanma, yetersiz bakım) gibi teknolojik hataların birleşimi sonucu ortaya çıkmaktadır.

Hasar analizleri, imal edilen çelik yapılarda yorulma çatlağının çoğunlukla gerilim yığılmasının yüksek olduğu çentik etkisine sahip kaynak geometrilerinden başladığını göstermiştir. Kaynaklı bağlantılar, yük aktarımında yüksek gerilim yığılmalarına yol açarak, zamanla servis şartlarındaki yüklemelere rağmen hasar oluşturabilmektedir.

ÖZET

Rüzgâr enerjisi, sürekli olarak kullanılan en eski yenilenebilir enerji kaynakları arasında yer almaktadır. Günümüzde karasal rüzgâr türbinlerinin kurulu gücü dünya genelinde 944 GW'ı geçmiştir. Ancak sürekli artan enerji talebi ve rüzgâr enerjisi yönünden zengin karasal alanların sınırlı oluşu, kıyı ve açık denizlerde kurulan deniz üstü rüzgâr türbinlerine yönelimi hızlandırmıştır. Çünkü deniz üstü alanlar, karasal alanlara göre çok daha engelsiz ve rüzgâr enerjisi yönünden zengindir. Böylece daha düşük yüksekliklerdeki güçlü ve stabil rüzgâr hızlarından faydalanılabilmekte ve yıllık enerji verimliliği arttırılmaktadır. Denizin taban yapısına, su derinliğine, ve zorlu atmosferik-oşinografik koşullara bağlı olarak farklı taban ve temel tiplerine sahip deniz üstü rüzgâr türbinleri tercih edilmektedir. Denizde 50 metre derinliğe kadar olan bölgelerde sabit temel tipi oldukça ekonomik iken, derinliğin 50 metreyi aşan bölgelerde yüzer temel tipleri kullanılmaktadır. Yüzer temelli türbinler, derinlikten bağımsız olarak geniş alanlarda enerji üretimine imkan tanısa da ilk yatırım, karmaşık demirleme ve bakım maliyetleri sabit temelli tiplere göre daha yüksektir. Ayrıca yüzer tip türbinlerin fiziksel prototip testleri (rüzgâr tüneli, ölçekli saha deneyleri ve veri toplama altyapısı) çok yüksek maliyetlere sahiptir. Ancak, Hesaplamalı Akışkanlar Dinamiği (HAD) aracılığıyla, yapısal analiz, dalga-etkileşim modelleri ve kontrol sistemleri gibi çoklu fizik simülasyonları sanal ortamda gerçekleştirilerek, henüz tasarım aşamasında yüksek performanslı türbin modelleri belirlenebilmektedir. Böylece yüksek maliyetli test aşamasından kâr edilerek tasarım süreçleri hızlandırılmakta ve riskler önemli ölçüde azaltılmaktadır. Bu çalışmada, günümüzde literatürdeki test ve simülasyonlarla doğrulanmış model verilerinin makine öğrenmesi tekniğiyle işlenerek, belirli bir türbin tipinin tepki çıktısını veren matematik modelinin ve transfer fonksiyonunun oluşturulmasını sağlayacak algoritmanın geliştirilmesi ele alınmıştır. Böylece tasarım uzayı oldukça geniş modellerde bile çok kısa süreler içerisinde türbin performansı belirlenebilmekte ve fizibilite projesi aşamasındayken en ideal türbin modeli elde edilebilmektedir.

COASTAL AND OFFSHORE WIND TURBINE TYPES AND MODELLING

ABSTRACT

Wind energy is among the oldest continuously used renewable energy sources. Currently, the installed capacity of land-based wind turbines worldwide exceeds 944 GW. However, increasing energy demand and the limited availability of wind-rich land areas have accelerated the shift toward offshore wind turbines installed along coasts and offshore. Offshore regions are more open and have richer wind resources than onshore areas. This allows for the use of strong and stable wind speeds at lower heights, improving annual energy efficiency. Offshore wind turbines with different foundation types are chosen based on seabed conditions, water depth, and challenging weather and sea conditions. While fixed foundations are cost-effective in areas up to 50 meters deep, floating foundations are used in deeper waters. Floating turbines can generate energy over large areas regardless of depth, but they require a higher initial investment, complex mooring systems, and higher maintenance costs compared to fixed foundations. Physical prototype testing, including wind tunnel experiments, scaled field tests, and data collection infrastructure, is very expensive. However, using Computational Fluid Dynamics (CFD), it is possible to identify high-performance turbine designs during development through multi-physics simulations that include structural analysis, wave interaction models, and control systems in a virtual environment. This approach eliminates costly physical testing, accelerates the design process, and significantly reduces risks. In this study, the development of an algorithm that generates the mathematical model and transfer function providing the response output of a specific turbine type by processing model data validated through tests and simulations in the literature with machine learning techniques is discussed. This method allows for the assessment of turbine performance in very short timeframes, even for models with extensive design spaces. As a result, the optimal turbine model can be identified during the project's feasibility phase.

Keywords: Offshore Wind Turbine, Turbine Modelling, Machine Learning, Response Function, CFD.

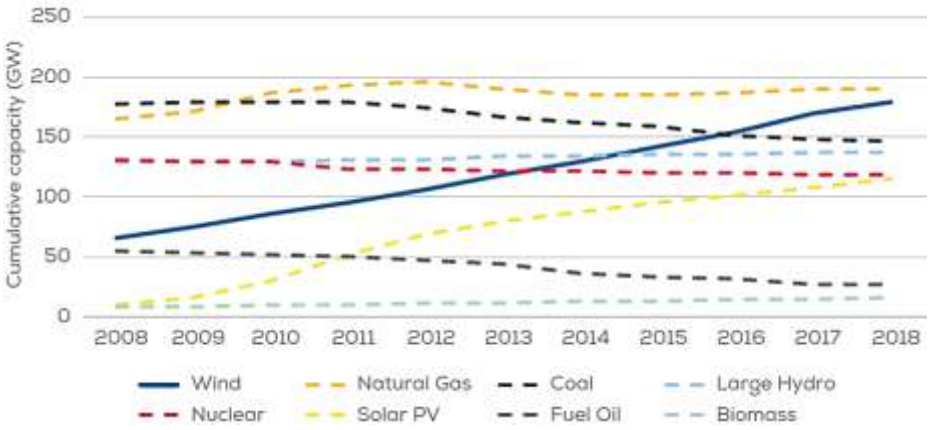
GİRİŞ

Rüzgâr enerjisi, yenilenebilir enerji kaynakları arasında giderek artan bir öneme sahiptir ve küresel yeşil enerji dönüşümünün merkezinde yer almaktadır. Güncel verilere göre, dünya genelinde karasal rüzgâr türbinlerinin toplam kurulu kapasitesi 944 GW'ı aşmış durumdadır (Communication, 2024). Bununla birlikte, rüzgâr enerjisi bakımından zengin olan karasal bölgelerdeki uygun alanların sınırlı olması, yerleşim yoğunluğu ve artan enerji talebi, üretim altyapısının deniz ortamlarına taşınmasını zorunlu kılmaktadır. Bu nedenle, son yıllarda deniz üstü rüzgâr enerjisi teknolojileri hem araştırma hem yatırım alanında hızla öne çıkmıştır.

Deniz ortamında, rüzgârın karaya kıyasla daha istikrarlı, yüksek hızlı ve düşük türbülanslı olması, türbinlerin verimliliğini önemli ölçüde artırmaktadır. Rüzgâr akışının engellerle kesintiye uğramaması, enerji üretiminde sürekliliği ve istikrarı sağlar. Bu avantajlara karşın, deniz koşulları sistem tasarımı açısından yeni teknik zorluklar doğurmaktadır. Özellikle su derinliği, deniz tabanı özellikleri, akıntılar ve atmosferik etkiler, deniz üstü türbinlerin yapısal tasarımını ve işletme stratejilerini doğrudan etkilemektedir.

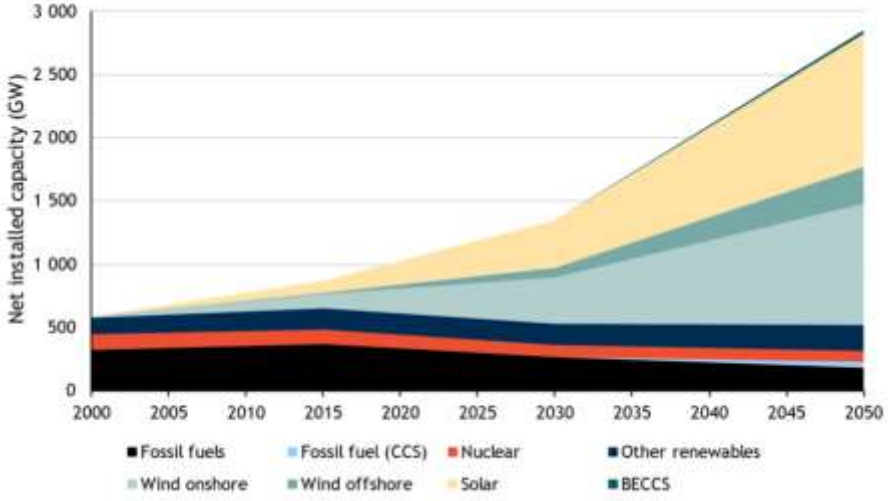
Deniz üstü rüzgâr türbinleri (DRES) genel olarak sabit temelli ve yüzer platformlu sistemler olarak iki temel sınıfta incelenmektedir. Sabit temelli sistemler genellikle 50 metreye kadar olan sığ denizlerde uygulanabilirken, derin sularda bu yöntem teknik açıdan sınırlı kalmaktadır. Bu tür ortamlarda yüzer türbin sistemleri, su derinliğinden bağımsız enerji üretimi sağlayarak önemli bir alternatif oluşturur. Bununla birlikte, yüzer platformlarda demirleme sistemleri, stabilite kontrolü ve bakım operasyonları gibi etkenler, sabit temelli sistemlere göre hem ilk yatırım hem de işletme maliyetlerini artırmaktadır. Türbin performansının henüz tasarım aşamasındayken optimize edilmesi, proje maliyetlerinin düşürülmesi ve sürdürülebilirlik açısından oldukça kritiktir.

Bu çalışmada amaç henüz fiziksel test veya prototip aşamasına gelmeden önce sayısal simülasyon temelli optimizasyon yöntemleriyle türbin performansının değerlendirilmesidir. Ayrıca hali hazırda literatürde test ve simülasyonlarla doğrulanmış model verilerinin makine öğrenmesi tekniğiyle işlenerek, belirli bir türbin tipinin tepki çıktısını veren matematik modelinin ve transfer fonksiyonunun oluşturulmasının gerekliliği bu çalışmada ele alınmıştır. Böylece tasarım uzayı oldukça geniş modellerin türbin performansı saniyeler içerisinde belirlenebilmekte ve fizibilite projesi aşamasındayken en ideal türbin modeli dakikalar içerisinde elde edilebilmektedir.



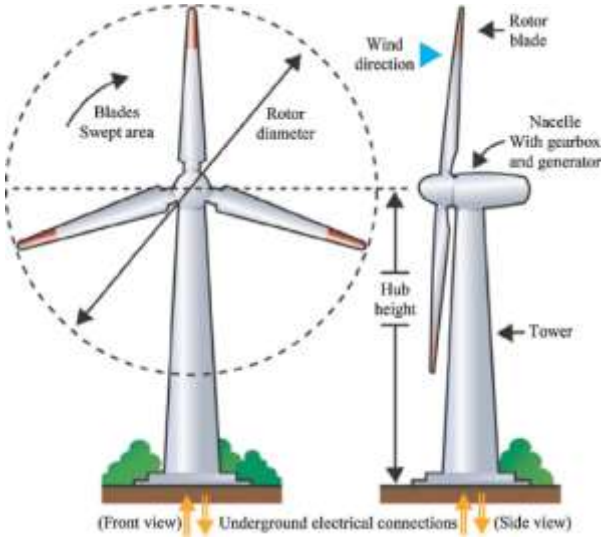
Küresel Ölçekte Rüzgâr Türbinleri

Rüzgâr enerjisi, küresel ölçekte enerji üretiminde hızla önem kazanan sürdürülebilir kaynaklardan biri haline gelmiştir. Artan çevresel kaygılar, fosil yakıtların tükenme riski ve karbon emisyonlarının azaltılması yönündeki politik hedefler, yenilenebilir enerjiye olan talebi her zamankinden fazla artırmıştır. Bu dönüşüm sürecinde rüzgâr enerjisi hem karadaki hem de denizdeki uygulamalarda geniş bir kullanım alanı bularak enerji dönüşümünün temel unsurlarından biri olmuştur.



Teknolojik ilerlemeler, rüzgâr türbinlerinin aerodinamik verimini ve güç dönüşüm etkinliğini etkili oranda yükseltmiş, buna bağlı olarak enerji üretim maliyetleri geçmişe kıyasla belirgin şekilde azalmıştır. Ayrıca, uluslararası kurumlar ve devletler tarafından yürürlüğe konulan teşvik politikaları, yenilenebilir enerjiye geçiş sürecini hızlandırmıştır. Bu gelişmeler sonucunda, rüzgâr enerjisinin küresel enerji üretimindeki payı son on yılda sürekli artış göstermiştir. Şekil 1a'da, 2008–2018 yılları arasında Avrupa'da yenilenebilir enerji kaynaklarına dayalı kurulu güçteki değişim gösterilmektedir. Grafik, rüzgâr enerjisindeki artış trendinin gelecekte de süreceğini açık biçimde ortaya koymaktadır. Benzer bir projeksiyon da

Heflich vd. (2022) tarafından yapılmıştır. Özellikle "net sıfır emisyon" hedefi senaryosu kapsamında, yenilenebilir enerji kaynaklı kurulu güç kapasitesine göre 2050 öngörüsü Şekil 1b'de gösterilmiştir. Deniz üstü rüzgâr türbinlerinden elde edilecek enerjinin giderek artması, birim başına enerji maliyetlerinin de giderek azalması beklenmektedir.



Rüzgâr enerjisinden elektrik üretimi, aerodinamik kuvvetleri elektrik enerjisine dönüştüren rüzgâr türbinleri aracılığıyla sağlanmaktadır (Şekil 2). Rüzgâr akımı, kanat profilleri üzerinden geçerken bir kaldırma kuvveti oluşturur ve bu kuvvet kanatların dönmesini sağlar. Kanatların oluşturduğu dönme momenti, rotor mili aracılığıyla jeneratöre iletilir; burada mekanik enerji elektrik enerjisine dönüştürülür. Üretilen elektrik, transformatörlerle gerilimi yükseltilerek şebekeye aktarılır. Günümüz türbinleri, rüzgâr yönü ve hızındaki değişimleri anlık olarak izleyen akıllı kontrol sistemleri ve gerektiğinde enerji depolama üniteleriyle birlikte çalışabilen hibrit yapıdadır (Terzioğlu vd., 2019).

Şekil 1a: Avrupa'da yenilenebilir enerji kaynaklı kurulu güç kapasitesinin 2008 yılından 2018 yılına kadar olan değişimi (Komusanac vd., 2019)

Şekil 1b: 2050 yılına kadar (net sıfır emisyon hedefi doğrultusunda), enerji kaynaklarına göre Avrupa Birliği'nin geleceğe yönelik net elektrik üretim kapasitesi tahmini (Heflich vd., 2022)

Şekil 2: Temel bir rüzgâr türbininin elemanları (Aminzadeh vd., 2023)

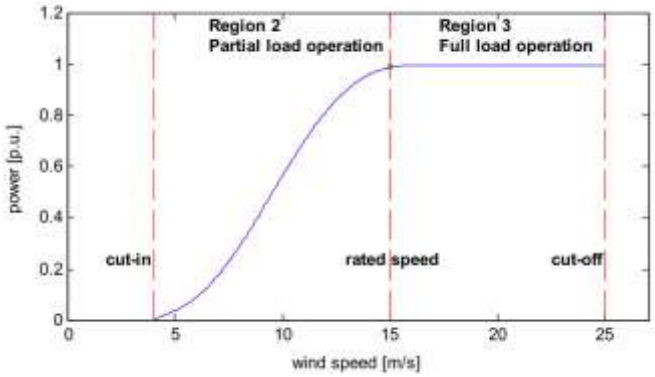
Rüzgâr türbinlerinden elde edilebilecek güç, esas olarak rüzgâr hızı ve kanatların tarama alanı ile ilişkilidir. Üretilen güç, hızın küpüyle orantılı olarak artar. Bu nedenle, rüzgâr hızının iki katına çıkması, enerji üretiminin yaklaşık sekiz kat artması anlamına gelir. Türbin kanat uzunluğu da üretim kapasitesinde belirleyici bir unsurdur; kanat yarıçapının büyümesiyle rotorun süpürdüğü alan artar ve daha fazla hava kütlesiyle etkileşim sağlanır. Rüzgâr enerjisinden elde edilen güç Denklem (1) ile ifade edilir:

$$P = \frac{1}{2}\rho A U_{\infty}^{3} C_p \qquad (1)$$

Burada,

P: Güç (Watt)

ρ: Hava yoğunluğu (kg/m^3)



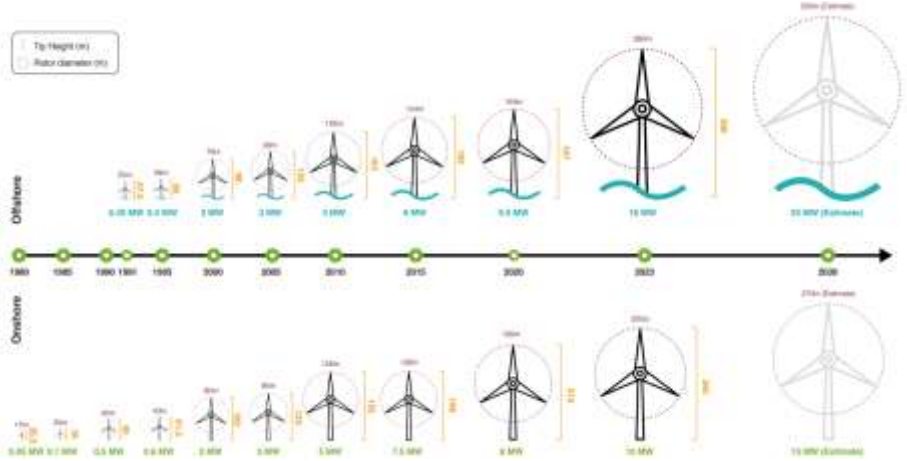
A: Pervanenin süpürdüğü alanı (m2)

U_{∞}: Rüzgâr hızı (m/s)

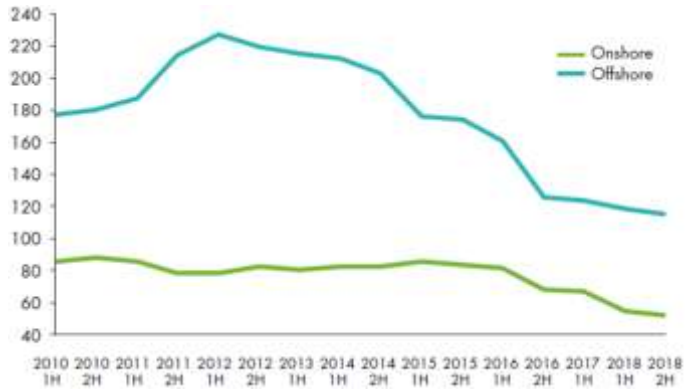
C_P: Güç katsayısı (Cp < 0,593 Betz kriter sınırı)

olarak ifade edilir. Bu bağıntı, rüzgâr türbininin teorik verim sınırını tanımlar ve türbinin tasarım parametrelerinin enerji üretim üzerindeki etkisini açık biçimde ortaya koyar.

Bir türbin yalnızca belirli rüzgâr hızı aralıklarında enerji üretimi yapabilir (Şekil 3). Türbinin çalışmaya başladığı en düşük hız olan genellikle 3–4 m/s “cut-in hızı” olarak adlandırılır. Bu hızın altında kanatların dönmesi için gerekli kinetik enerji oluşmaz. Rüzgâr hızı nominal (rated) değere ulaştığında (yaklaşık 12–15 m/s), türbin maksimum kapasitede çalışır. Bu değerin üzerindeki artışlar çıkış gücünü etkilemez; çünkü sistem bu noktada güç sınırlama moduna geçer. Cut-off hızı (yaklaşık 25 m/s) aşıldığında türbinin yapısal bütünlüğünü korumak ve servis ömrünü uzatmak için, türbin otomatik olarak durdurulur.

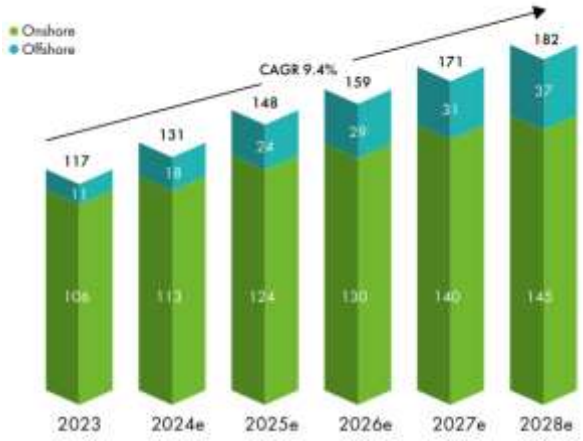


Şekil 3: Rüzgâr hızı ile türbin enerji çıkışı karakteristiği (Hall vd., 2010)



Rüzgâr hızının zamana göre istikrarlı olması, yani kaliteli rüzgâr koşullarının sağlanması, enerji üretiminde süreklilik açısından büyük önem taşır. Hızın ani değişim göstermemesi, türbin kanatları üzerindeki yükleri azaltır; böylece sistem daha kararlı çalışırken, sistemde oluşan mekanik yorulma değerlerinde azalma olur. Bu durum bakım aralıklarını uzatır ve işletme maliyetlerini düşürür. Aynı zamanda enerji üretimindeki kesintiler azaldığı için kapasite faktörü artar (Ünal vd., 2024).

Kara üstü türbinler, erişilebilirlik ve düşük yatırım maliyeti açısından avantajlıdır. Karada kurulum ve bakım operasyonları daha kolaydır; ayrıca uzun yıllara dayanan mühendislik birikimi sayesinde teknolojik olarak daha olgun bir yapıdadır. Ancak, karasal alanlarda rüzgâr potansiyeli genellikle düşüktür ve arazi pürüzlülüğü, binalar ve bitki örtüsü gibi engeller akış rejimini olumsuz etkiler. Bu nedenle türbin kulelerinin yüksekliği artırılmak zorunda kalınır. Ayrıca, görsel etki, gürültü ve arazi kullanımı gibi çevresel faktörler toplumsal kabulü zorlaştırabilir. Buna karşın, deniz üstü rüzgâr türbinleri daha düzenli (daha az türbülans, ortalama hızda daha az sapma) ve daha yüksek rüzgâr hızlarından faydalanır. Deniz yüzeyinin pürüzsüz sayılması nedeniyle daha düşük yüksekliklerde bile kaliteli rüzgâr koşulları elde edilebilir. Bu türbinler genellikle daha büyük boyutlarda tasarlanabilir ve birim türbin başına düşen üretim miktarı artar. Ayrıca, yerleşim alanlarından uzak oldukları için gürültü ve estetik kaygılar minimize edilir. Ancak bu avantajların yanında, deniz ortamında kurulum, bakım ve erişim maliyetleri çok daha yüksektir. Tuzlu suyun oluşturduğu korozyon, dalga yükleri ve erişim zorlukları türbinlerin ömrünü ve bakım gereksinimlerini doğrudan etkiler. Ayrıca, denizel ekosistem üzerindeki olası etkiler de dikkatle değerlendirilmelidir (Şentürk ve Oğuz, 2020).

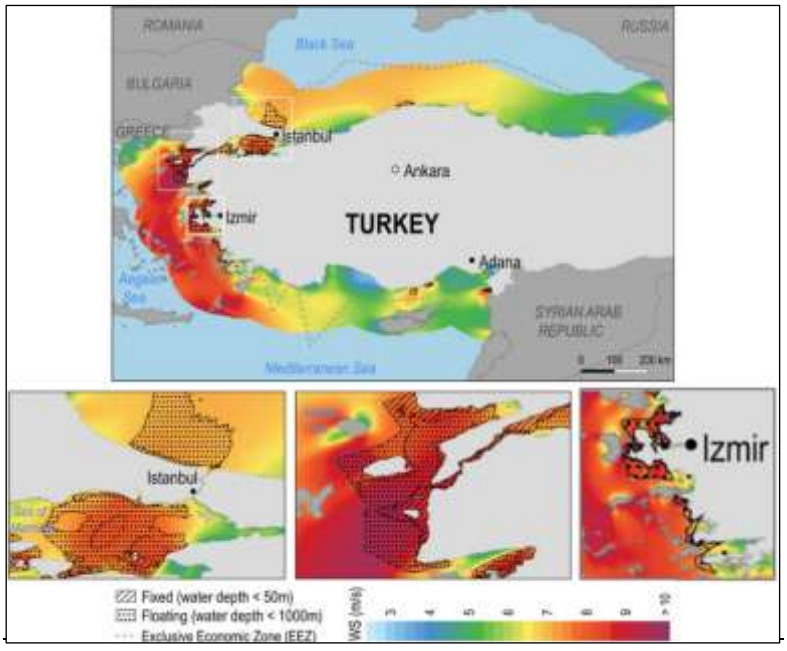


Son yıllarda düşen seyrüsefer ve kurulum maliyetleri, daha büyük rotor çapları ve gelişmiş malzeme teknolojileriyle birleşerek deniz üstü türbinlerin ekonomik açıdan giderek daha rekabetçi hale geldiğini göstermektedir. Şekil 4'te, 1980–2030 yılları arasında türbin boyutlarındaki gelişim; Şekil 5'te, türbin enerji maliyetlerinin zamana göre azalışı; Şekil 6'da ise 2024–2028 dönemi için kara ve deniz üstü türbinleri için kurulum beklentileri sunulmaktadır. Bu veriler, deniz üstü türbin teknolojilerinin gelecekte enerji sistemleri içinde daha baskın bir konuma yükseleceğini göstermektedir.

Şekil 4: Kara ve deniz üstü türbin büyüklükleri, 1980-2030 (Lee and Zhao 2024)

Şekil 5: Türbin başına (indirgenmiş) enerji maliyetinin tarihsel değişimi [$/MWh] (Ohlenforst vd., 2019)

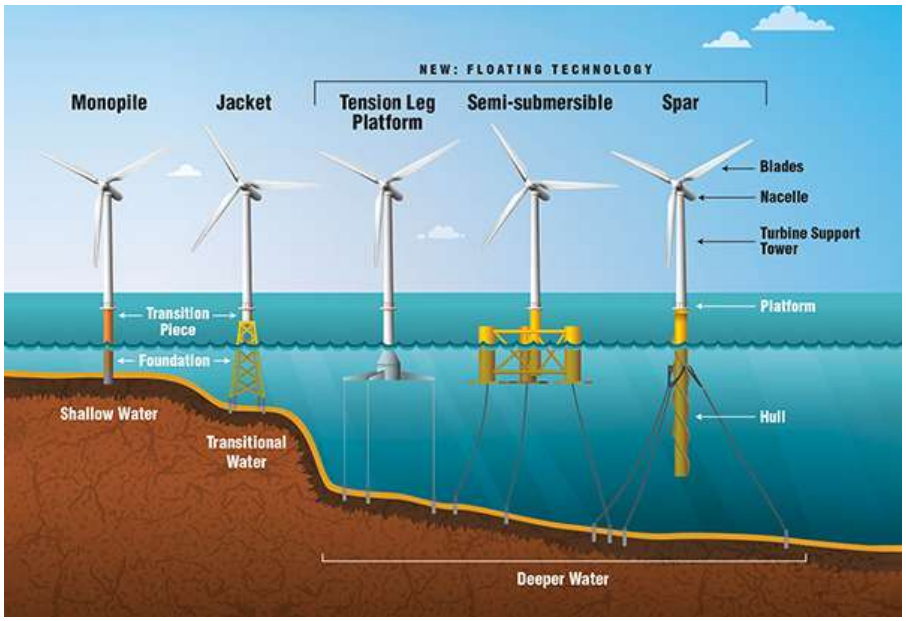
Şekil 6: 2024-2028 yılları arasındaki kara ve deniz üstü için türbin kurulum beklentisi [GW] (Ohlenforst vd., 2019)



BULGULAR

Dünya Bankası'nın yayımladığı Going Global 2019 raporunda (Dutton vd., 2019), Türkiye'nin kıyı bölgelerinde dikkate değer bir deniz üstü rüzgâr enerjisi potansiyeline sahip olduğu vurgulanmıştır. Çalışmada özellikle Marmara ve Ege Denizi kıyılarının rüzgâr rejimi açısından uygun koşullar sunduğu, bu bölgelerin sabit ve yüzer tabanlı türbin teknolojileri için elverişli fırsatlar oluşturduğu belirtilmiştir. Ayrıca, Çanakkale Boğazı ve çevresindeki sığ deniz alanlarının, düşük maliyetli sabit temelli kurulumlara uygun olduğu ifade edilmiştir (Şekil 7).

Rüzgâr türbinlerinin kurulacağı alanlarda deniz derinliği önemli bir tasarım kriteridir. Türbinlerin güvenli ve uzun ömürlü çalışabilmesi için deniz tabanı koşullarına uygun temel tipinin seçilmesi gerekmektedir (Uzunoğlu vd., 2021). Temeller genel olarak sabit ve yüzer olmak üzere iki ana sınıfta incelenir (Şekil 8).



- 0–30 m derinliğe sahip sığ bölgelerde monopil temeller yaygın olarak kullanılır. Bu temeller, çelik boruların deniz tabanına çakılmasıyla oluşturulur ve düşük maliyetleriyle öne çıkar.
- 30–50 m aralığındaki orta derinliklerde ceket (jacket) tipi kafes yapılar tercih edilir. Dört ayaklı bu sistemler, yüksek stabilite sağlar ve zeminle geniş bir temas yüzeyi oluşturur.
- 50 m üzerindeki derin deniz koşullarında ise yüzer temeller (platformlar) kullanılır. Bu yapılar yüzeyde dengede kalır ve çelik halatlarla deniz tabanına demirlenir.

Doğru temel seçimi, yalnızca yapısal dayanıklılığı değil, aynı zamanda bakım sıklığını, ömür maliyetini ve enerji verimliliğini de doğrudan etkiler.

Şekil 7: Türkiye'de deniz üstü rüzgâr enerjisi potansiyelinin yüksek olduğu bölgeler -Dünya Bankası Raporu (Dutton vd., 2019)

Fizibilite çalışmalarında görüldüğü üzere, temel sistemi türbin maliyetinin en yüksek payına sahip bileşenlerden biridir. Yanlış temel seçimi, yatırım maliyetinin yükselmesine ve operasyon süresince performans düşüşüne neden olabilir.

Şekil 8: Deniz üstü rüzgâr türbinlerinde sabit ve yüzer tip temeller (Iraeta, 2021)

Yüzer platformlu türbinlerin ömrü, maruz kaldıkları rüzgâr, dalga ve akıntı yüklerinin dinamik karakterine doğrudan bağlıdır (Uzunoğlu vd., 2021). Bu kuvvetler, sistemde salınım, devinim ve eğilme momentleri oluşturarak türbin bileşenlerinde yorulma ve deformasyona neden olur. Bu nedenle, tasarım aşamasında doğal frekansın, çevresel yüklerin frekans aralığıyla çakışmaması büyük önem taşır; aksi durumda rezonans meydana gelir ve platform kararlılığı bozulur.

Hesaplama Modelleri

Fiziksel deneyler, türbin tasarımlarının güvenilir şekilde doğrulanması için en kesin yöntemdir. Rüzgâr tüneli testleri, dalga tankı deneyleri, HIL (hardware-in-the-loop) sistemleri ve çeşitli ölçekli yüzer platform deneyleri, aerodinamik ve hidrodinamik davranışların gerçek ortamda ölçülmesini sağlar. Özellikle uluslararası projelerde kullanılan OC3, OC4, OC5 ve OC6 benchmark modelleri, birçok deneysel veri seti sunarak sayısal modellerin doğrulanmasında standart haline gelmiştir. Ancak prototip testlerinin;

- Çok yüksek maliyetli olması,
- Büyük ölçekli test tanklarına ihtiyaç duyulması,
- Karmaşık kurulum süreçleri ve
- Testlerin tekrarlanmasının zor olması

gibi önemli dezavantajları bulunmaktadır. Bu nedenle deneysel veriler genellikle yalnızca kritik doğrulamalar için kullanılır ve geniş parametrik çalışmalar yerine temel referans niteliği taşır.

HAD (Hesaplamalı Akışkanlar Dinamiği) yaklaşımları, rüzgâr türbinlerinin aerodinamik ve hidrodinamik davranışını üç boyutlu ve yüksek çözünürlüklü akış çözücüleri ile incelemeye imkân tanır. Türbin kanatları etrafındaki sınır tabaka gelişimi, ayrılma bölgeleri, kanat uç girdapları, iz bölgesi (wake) oluşumu, platform hareketlerinin aerodinamik yüklere etkisi ve türbin–dalga etkileşimi gibi karmaşık fiziksel süreçler HAD-SEM (Sonlu Elemenlar Metodu) ortak simülasyonu ile ayrıntılı biçimde çözülebilir. Özellikle LES, DES, RANS gibi türbülans modelleri, hem sabit tabanlı hem de yüzer türbinlerin çalışma koşullarını modellemede önemli

rol oynar. Deniz üstü türbinlerin yüksek maliyetleri göz önüne alındığında, bilgisayar destekli simülasyonlar —özellikle HAD analizleri— fizibilite sürecinin temel bir bileşenidir. Bu sayısal analizler, türbinin aerodinamik ve hidrodinamik yükler altındaki davranışını öngörür ve fiziksel testlerin yerini büyük oranda alabilir. Böylece hem zamandan hem de prototip maliyetinden tasarruf edilebilir. Bir HAD simülasyonunda, performans değerlendirmesi şu temel kriterlere göre yapılır:

- Güç Üretimi: Türbinin farklı rüzgâr hızlarındaki enerji üretim kapasitesi, nominal hız aralığında verimliliğini belirler.
- Rezonans Analizi: Türbinin doğal frekansının dalga ve rüzgâr kaynaklı yüklerle etkileşimi kontrol edilerek yapısal güvenlik değerlendirilir.
- Stabilite ve Hareket: Platformun ileri-geri, yanal ve düşey hareketleri ile dönme, yalpa ve baş-kıç salınımı analiz edilir.

HAD analizleri yüksek doğruluk sağlamakla birlikte, çok yüksek hesaplama maliyetleri, uzun çözüm süreleri ve ağ yapısı (mesh) hassasiyeti gibi dezavantajlara sahiptir. Oldukça uzun hesaplama süreçleri, rüzgar enerjisi fizibilite projelerinin süresinin uzamasına ve böylece finansman sürecinde aksamalara sebebiyet vermektedir. Bu nedenle yalnızca kritik çalışma koşullarının detaylı incelenmesinde veya doğrulama aşamasında tercih edilir.

Deniz üstü rüzgâr türbinlerinin (DRES) aero-hidro-servo-yapısal davranışlarının modellenmesinde en yaygın yaklaşım, birden fazla fiziksel modülün zaman alanında eşzamanlı çalıştırıldığı entegre simülasyon çerçeveleridir. Bu kapsamda kullanılan OpenFAST, QBlade, MoorDyn, ElastoDyn, HydroDyn, AeroDyn, ServoDyn gibi açık kaynaklı yazılımlar; rüzgâr türbini tasarımında ihtiyaç duyulan çoklu fiziği düşük maliyetle ve yüksek esneklikle çözme imkânı sunmaktadır. Bu araçlar, türbinin tüm alt sistemlerini birbirine bağlı olarak çözer:

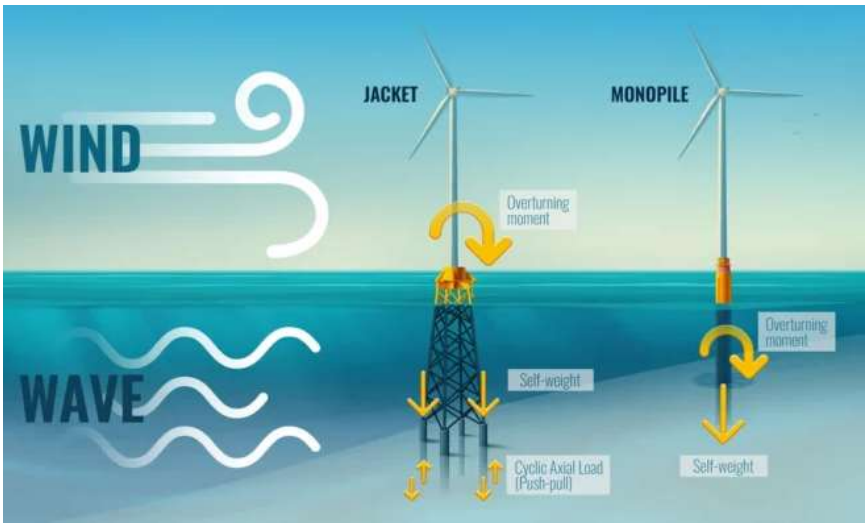
- Aerodinamik yükler, AeroDyn modülü ile BEM/UBEM tabanlı hesaplanır; kanat üzerindeki kaldırma/direnç kuvvetleri, açısal hız, TSR (Tip Speed Ratio – Kanat Uç Hızı) ve iz bölgesi etkileri zaman içinde takip edilir.
- Hidrodinamik davranışın analizinde, HydroDyn modülü ile Morison tabanlı kuvvetler veya potansiyel teori tabanlı çözüm uygulanır; platformun dalga etkisi altındaki hareketleri hesaplanır.
- Yapısal esnekliği belirlemek için, ElastoDyn modülü ile kule, rotor ve platformun elastik tepki özellikleri modellenir; özellikle yüzer türbinlerde eğilme-burulma momentleri bileşik etkisi kritik önemdedir.
- Kontrol sistemleri, ServoDyn modülü aracılığıyla, türbinin baş-kıç vurma ve dönme kontrolü ile jeneratör tork kontrolünü yönetir.
- Demirleme sistemi kapsamında, MoorDyn modülü ile zincirleme veya platform sabitleme hatlarının dinamik gerilme ve deplasmanları hesaplanır.

Bu açık kaynaklı çözümler, HAD'a kıyasla çok daha hızlıdır; dolayısıyla binlerce farklı deniz durumu, rüzgâr spektrumu, TSR değişimleri ve platform serbestlik dereceleri kısa sürede analiz edilebilir. Bu özellikleri sayesinde optimizasyon çalışmaları, parametrik taramalar ve erken tasarım değerlendirmeleri için ideal bir analiz altyapısı oluştururlar.

Açık kaynaklı aero-hidro-servo-yapısal analiz araçları, deniz üstü rüzgâr türbinlerinin bütüncül davranışını incelemek için yaygın biçimde kullanılmakla birlikte bazı temel sınırlamalara sahiptir. İlk olarak, aerodinamik modelleme çoğunlukla BEM/UBEM gibi yarı-ampirik yöntemlere dayanır ve bu yöntem tam HAD çözümlerine kıyasla daha basit olduğundan,

özellikle karmaşık akış ayrılmaları, iz bölgesi etkileşimleri ve yüksek TSR koşullarında doğruluk azalabilir. Hidrodinamik modellemeler ise genellikle potansiyel teori veya Morison denklemi gibi idealize yaklaşımlar kullanır; bu durum karmaşık platform geometrilerinde oluşan dalga yüklerinin, çarpma (slamming) etkilerinin ve türbülanslı akışların yeterince temsil edilememesine neden olabilir. Bunun yanı sıra, yapısal modeller çoğu zaman lineerleştirilmiş kiriş teorilerine dayanır ve yüksek deformasyon veya bağlantı bölgelerindeki karmaşık gerilme dağılımlarını tam olarak belirleyemez. Demirleme sistemlerinin modellenmesinde de benzer şekilde hatların akış kaynaklı titreşimleri, ani yük geçişleri ve malzemelerin doğrusal olmayan davranışları sınırlı oranda temsil edilir. Tüm bu alt modüller genellikle zayıf akuple (loosely coupled) şekilde çalıştığından, aerodinamik–hidrodinamik–yapısal–kontrol etkileşimi tam akuple çözümler kadar doğru sonuç üretmeyebilir.

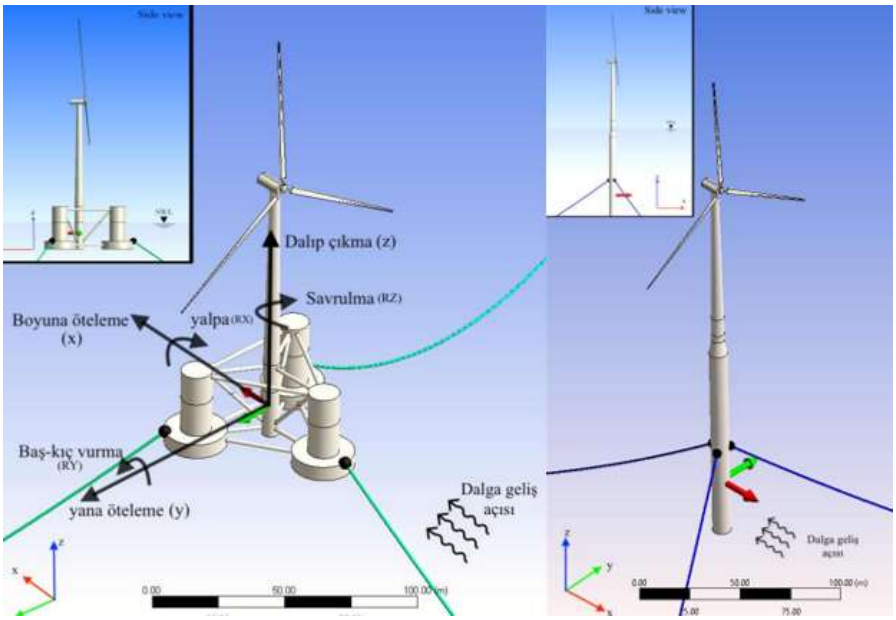
Sonuç olarak bu açık kaynaklı modeller, kavramsal tasarım ve ön fizibilite çalışmaları için oldukça yeterli olsa da, detaylı yük kestirimi, karmaşık dalga koşulları veya tüm zaman serisi boyunca doğruluk gerektiren hassas mühendislik problemlerinde ek doğrulama veya daha yüksek doğruluğa sahip HAD–SEM analizleriyle desteklenmek zorundadır.



Kuşkusuz, hem yüksek doğruluk değerlerine sahip sonuçlar elde etmek için hassas analizler gerçekleştirme zorunluluğu dolayısıyla, hem de yapıların büyüklüğüyle ve karmaşıklığıyla orantılı olan büyük ağ yapısından dolayı bu tarz gerçekçi simülasyonların hem zaman bakımından hem de donanım bakımından maliyetleri oldukça yüksektir. Ayrıca bir parametre değişiminde simülasyonun en baştan tekrarlanması ihtiyacı da parametrik analizlerdeki maliyetlerin daha da artmasına sebebiyet vermektedir. Bu sebeple Reduced Order Modelling (ROM – düşük mertebeli modelleme) ve matematiksel tepki fonksiyonlarının kullanılması, simülasyon süreçlerinin doğruluktan ödün verilmeden kısaltılması ve kolaylaştırılması bakımından önem taşır.

ROM, hesaplamalı akışkanlar dinamiği ve yapısal analiz gibi yüksek hesaplama maliyetine sahip sayısal analizlerin sonuçlarını, daha düşük boyutlu matematiksel bir modelle temsil etmeyi amaçlayan indirgeme tekniğidir. Bu yöntem, tam mertebeli modellerin (Full Order Model – FOM) davranışını tanımlayan binlerce denklemi veya serbestlik derecesini, sistemin dinamik özelliklerini koruyarak daha az sayıda bağımsız bileşenle ifade eder (Benner vd., 2015). ROM'un temel amacı, karmaşık sistemlerin hesaplanma süresini büyük ölçüde azaltırken fiziksel doğruluğunu korumaktır. Bunun için genellikle Proper Orthogonal Decomposition (POD) gibi yöntemlerle sistemin baskın enerji modları belirlenir ve bu modlar üzerinden indirgenmiş bir temsili model oluşturulur. Böylece, örneğin bir yüzer rüzgâr türbininin akışkan–katı etkileşimi gibi çoklu fizik analizlerinde günler süren hesaplamalar saniyeler içinde sonuçlanabilir.

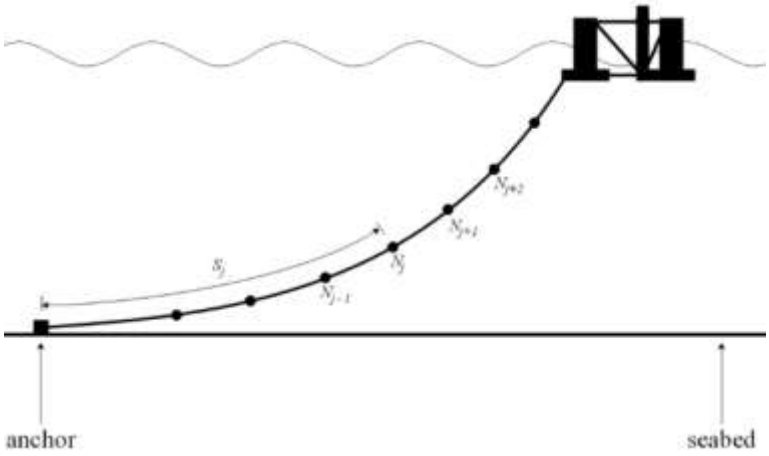
Yüzer temelli türbinler için ROM, farklı çevresel koşullarda sistem tepkisinin (yer değiştirme, eğilme momenti, güç üretimi vb.) hızlı biçimde tahmin edilmesine olanak tanır. Bu özellik, bilhassa tasarım optimizasyonu ve fizibilite çalışmaları sırasında maliyetleri düşürmek ve tasarım süresini kısaltmak açısından stratejik öneme sahiptir.



Simülasyonların Kapsamı ve Örnekleri

Sabit tabanlı türbinlerde rijitlik yüksek olduğu için serbestlik derecesi düşüktür ve yapılar çoğunlukla eğilme momentleri altında çalışır (Şekil 8 ve 9). Bu durumda, yorulma ve plastik deformasyonun doğru modellenmesi, ömür tahmini açısından kritik önemdedir (Yeter ve Garbatov, 2014).

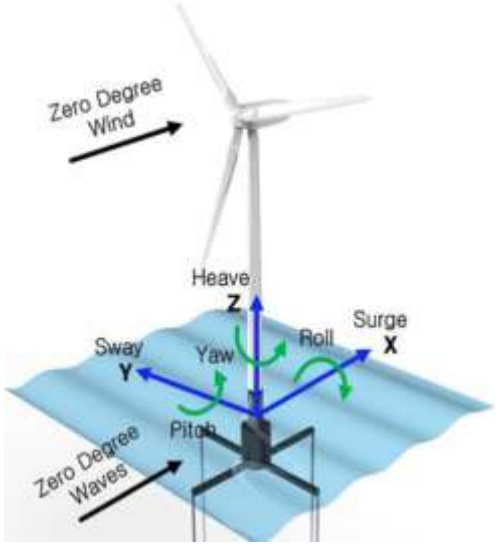
Şekil 9: Farklı sabit temel tiplerine sahip deniz üstü rüzgâr türbinlerine etkiyen yükler ve türbin tepkisi (Bentley Blog, 2022)



Yüzer türbinler, altı serbestlik derecesine sahip hareket dinamiği açısından karmaşık sistemlerdir. Bu tür platformlar genellikle çelik halatlarla (catenary mooring lines) deniz tabanına sabitlenir (Şekil 8 ve 9). Aktaş vd. (2018), yarı batık (semi-submersible) tipi temeli ve spar tipi temeli karşılaştırarak sayısal modellerin doğruluğunu değerlendirmiştir (Şekil 10). Çalışmada kaldırma kuvveti, balast sistemi ve doğal frekans analizleri incelenmiş; elde edilen sonuçlar deneysel veriler ve OC3/OC4 doğrulama modelleriyle karşılaştırılmıştır. Bu yaklaşım, simülasyon yazılımlarının gerçek sistem davranışını temsil etme yetkinliğini test etmiştir.

Şekil 10: Farklı yüzer temel tiplerinin sayısal modellenmesi- Yarı Batık tipi (semi-submersible, solda), Spar tipi (sağda) (Aktaş vd., 2018)

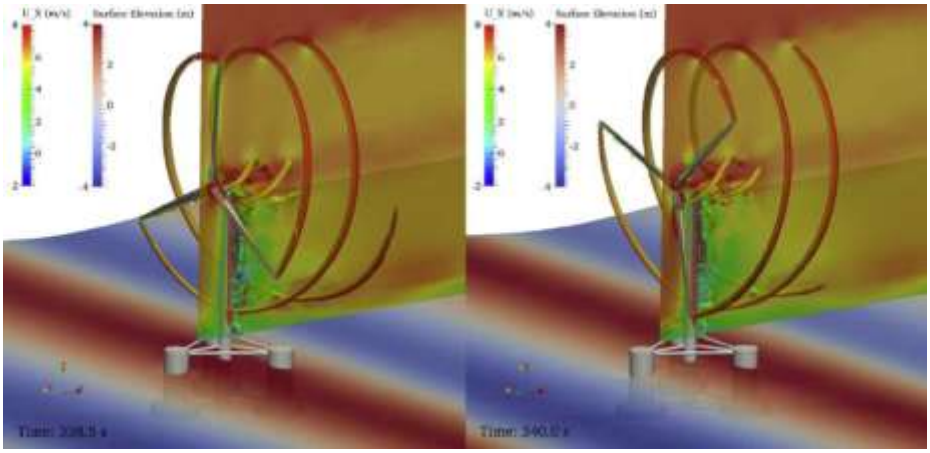
Yüzer türbinlerin demirleme sistemleri, platform dinamiğinde belirleyici unsurlardan biridir. Alkarem vd. (2021) çalışmalarında zincirleme hattı modelleriyle, kabloların kütlesi, akış sürüklemesi, elastik deformasyon ve eğilme momentlerinin sistem üzerindeki etkilerini



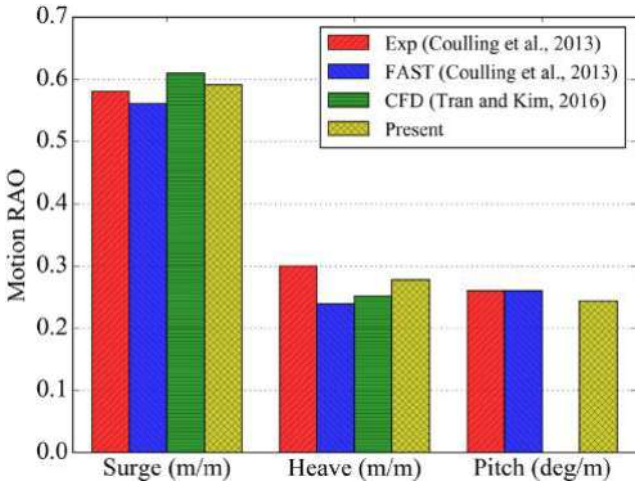
incelemiştir. Ayrıca ani gerilme (snap load) durumları analiz edilerek kablo güvenliği değerlendirilmiştir (Şekil 11).

Şekil 11: Demirlemenin modellenmesi (Alkarem vd., 2021)

Yüzer türbin simülasyonlarında dinamik davranışı doğru tanımlayabilmek için hem sınır koşullarının hem de çözüm algoritmalarının doğru belirlenmesi gereklidir. Tran vd. (2015) tarafından önerilen UBEM (Unsteady Blade Element Momentum) yöntemi, üç boyutlu akış modellemesinin yüksek hesaplama maliyetini azaltmak için geliştirilmiş bir yaklaşımdır (Şekil 12). Bu yöntem, kanat elemanlarına etki eden kuvvetleri bir boyutlu momentum denklemleriyle hesaplayarak, yüksek doğrulukta ancak düşük maliyetli aerodinamik sonuçlar elde edilmesini sağlar.



Zhang vd. (2020) çalışmasında, türbinin dalga etkisi altındaki hareketlerini analiz etmek için frekans alanı ve zaman alanı denklemleri tanımlanmıştır. Bu modellerde sistemin atalet momenti, radyasyon sönümü, viskoz etkiler ve dalga kuvvetleri dikkate alınmıştır. Elde edilen sonuçlarla, türbinin çevresel yükler altındaki yer değiştirme, hız ve ivme tepkileri belirlenmiş ve zaman-bağımlı güç üretimi tahmin edilmiştir.



Şekil 12: Deniz üstü yüzer temelli rüzgâr türbininin altı serbestlik derecesi (Tran vd., 2015)

Liu vd., (2017) gerçekleştirdiği çalışmada, yüzer rüzgâr türbinlerinin aerodinamik ve hidrodinamik davranışlarını aynı anda temsil edebilmek için tam akuple HAD analizleri (fully coupled simulations) uygulanmıştır (Şekil 13). Analizlerde, rüzgâr–dalga–yapı etkileşimlerini

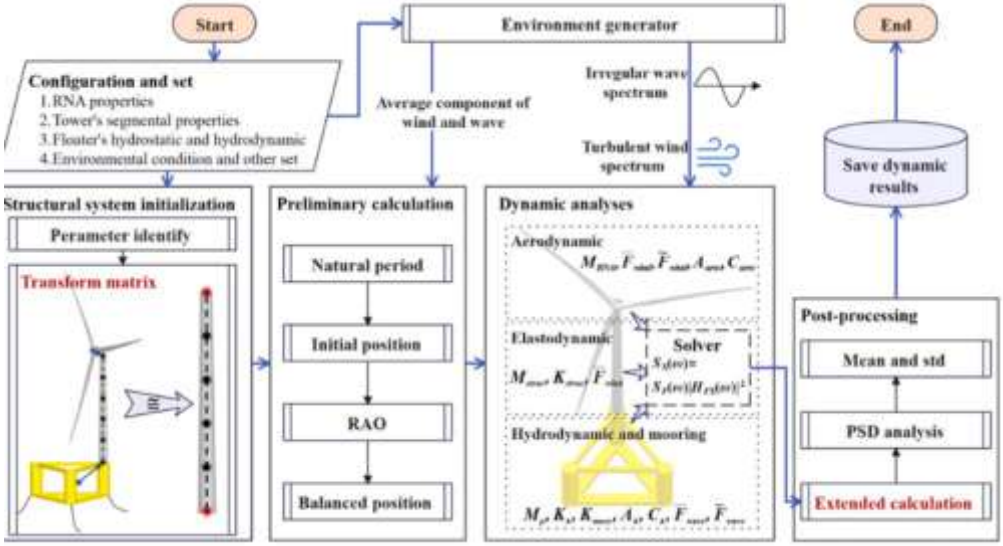
birlikte ele alan FSI (Fluid–Structure Interaction) yaklaşımı kullanılmıştır. Bu yöntemin tercih edilmesinin nedeni, yüzer platformun altı serbestlik derecesine sahip karmaşık dinamik davranışlarının ve kanat dönme momentlerinin, çevresel yüklerle etkileşimini doğru biçimde saptayabilmesidir (Şekil 14). Elde edilen sonuçlar, özellikle platform hareketleri, rotor momentleri ve kuplajlı akış alanlarının zamanla değişimini ortaya koymuştur. Ancak çalışma, bu analizlerin yüksek çözüm ağına, zamana bağlı çözüm yöntemlerine ve türbinin her bir zaman adımında yapı deformasyonlarının güncellenmesine ihtiyaç duyduğunu göstermektedir. Bu durum, hesaplama süresini günler mertebesine çıkararak yüksek donanım gereksinimi doğurmaktadır. Dolayısıyla bu tür tam akuple analizler, doğruluk açısından kritik olsa da mühendislik uygulamalarında hızlı karar verme süreçlerinde pratik değildir. Bu bağlamda, literatürde elde edilen bu yüksek doğruluk derecesine sahip sonuçlar, Reduced Order Model (ROM) oluşturulması için temel veri kaynağı niteliğindedir. ROM yaklaşımı, bu tip karmaşık FSI analizlerinden elde edilen verileri kullanarak saniyeler içinde tepki fonksiyonlarını tahmin edebilme potansiyeliyle, tasarım süreçlerini büyük ölçüde hızlandırabilir.

Şekil 13: Yarı-batık temelli deniz üstü rüzgar türbini akuple simülasyonu (Liu vd., 2017)

Şekil 14: Savrulma, batma-çıkma ve eğilme tepkileri için RAO karşılaştırması. (Liu vd., 2017)

OC5 Projesi'nin ikinci aşamasında, DeepCwind yarı batık yüzer rüzgâr türbini sistemi hem 1/50 ölçekli havuz testleri hem de sayısal modeller aracılığıyla analiz edilmiştir (Robertson vd., 2017). Çalışmanın amacı, yüzer rüzgâr türbinlerinin toplam yüklerinin (global loads)

doğrulanması ve farklı modelleme yaklaşımlarının sonuçlar üzerindeki etkilerinin değerlendirilmesidir (Şekil 15). Bu kapsamda, çeşitli kurumlar tarafından geliştirilen aerodinamik, hidrodinamik ve halat bağlama modelleri karşılaştırılmış; özellikle dinamik halat modelleri, nonlineer dalga kinematiği ve süreksiz aerodinamik modellerin doğruluğu artırdığı belirlenmiştir. Doğrulama, MARIN test havuzunda gerçekleştirilen deneylerden elde edilen ölçümlerle yapılmış; sekiz farklı rüzgâr–dalga senaryosu için nihai (ultimate) ve yorulma yükleri simülasyonlarla karşılaştırılmıştır (Şekil 16). Elde edilen sonuçlar, genel yük tahminlerinde yüksek tutarlılık göstermiş ancak kule tepe momentlerinde ve ön halat gerilmelerinde lineer dalga bölgesinin ötesindeki dalga uyarımlarının eksik temsil edilmesinden kaynaklı sapmalar gözlenmiştir. Bu çalışma, FSI temelli modellerin doğrulanması açısından literatürdeki en kapsamlı örneklerden biridir ve yüksek doğrulukla elde edilen bu sonuçlar, gelecekte ROM oluşturma süreçleri için kritik bir referans veri tabanı sağlamaktadır. Böylece, günler süren FSI simülasyonları yerine, bu verilerle eğitilmiş ROM modelleri kullanılarak sistem tepkileri saniyeler içinde tahmin edilebilir.



Li vd., (2025a) çalışmalarında, yüzer rüzgâr türbini platformlarının kavramsal tasarım sürecini hızlandırmak ve maliyetleri azaltmak için bir Entegre Tasarım Optimizasyon (IDO) çerçevesi geliştirmişlerdir. Tasarım sürecinde üç ana modül kullanılmıştır: Floater tasarımı, entegre modelleme ve analiz, ayrıca optimizasyon. İlk modül, panel ağ oluşturma, adaptif balast dağılımı, hidrostatik özellik analizi ve hidrodinamik katsayıların hesaplanmasını içerirken; ikinci modül frekans-domain (FD) kodu ile platformun dinamik tepkilerinin hızlı şekilde tahmin edilmesini sağlamıştır (Şekil 17). Üçüncü modül ise stabilite, güvenlik ve maliyet-etkinlik kriterlerine göre tasarım boyutlarını optimize etmiştir. Çalışma, 15 MW sınıfı bir türbin için üç sütunlu yarı-batık (semi-submersible) bir platform üzerinde bir “case-study” uygulaması sunmaktadır ve bu yöntemle baş-kıç vurma (pitch) hareketlerinde %40 düşüş, kule tabanındaki baş-kıç eğilme momentinde ise %17 azalma sağlandığını göstermektedir. Bu yaklaşım, geleneksel çok-serbestlik dereceli FSI (akuple aero-hidro-yapı) simülasyonlarına kıyasla önemli ölçüde daha düşük donanım ve zaman gereksinimi sunmakta; bu durum, ilerleyen çalışmalarda ele alacağınız ROM yaklaşımının gerekçesiyle doğrudan örtüşmektedir.

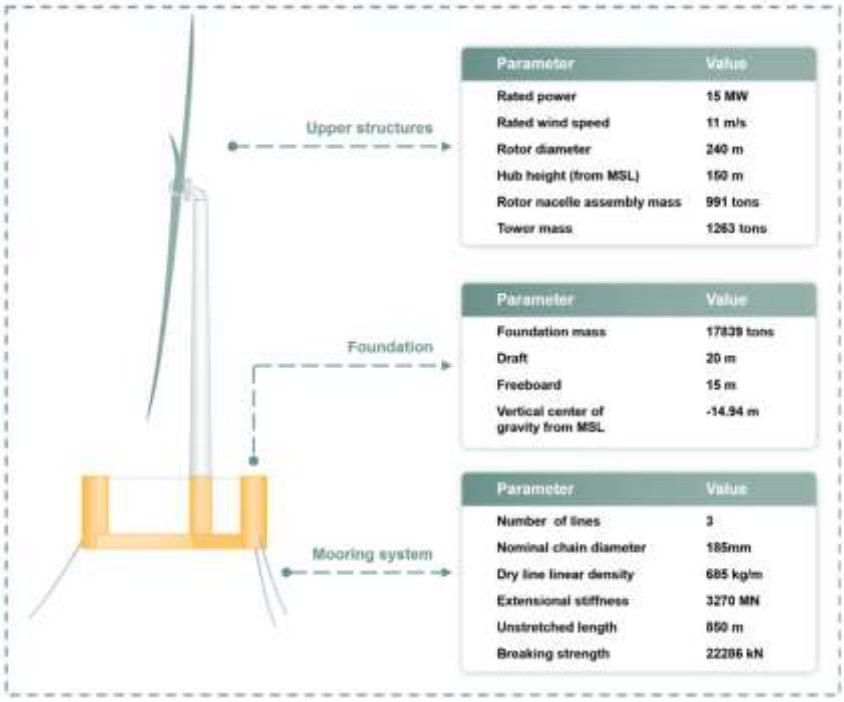
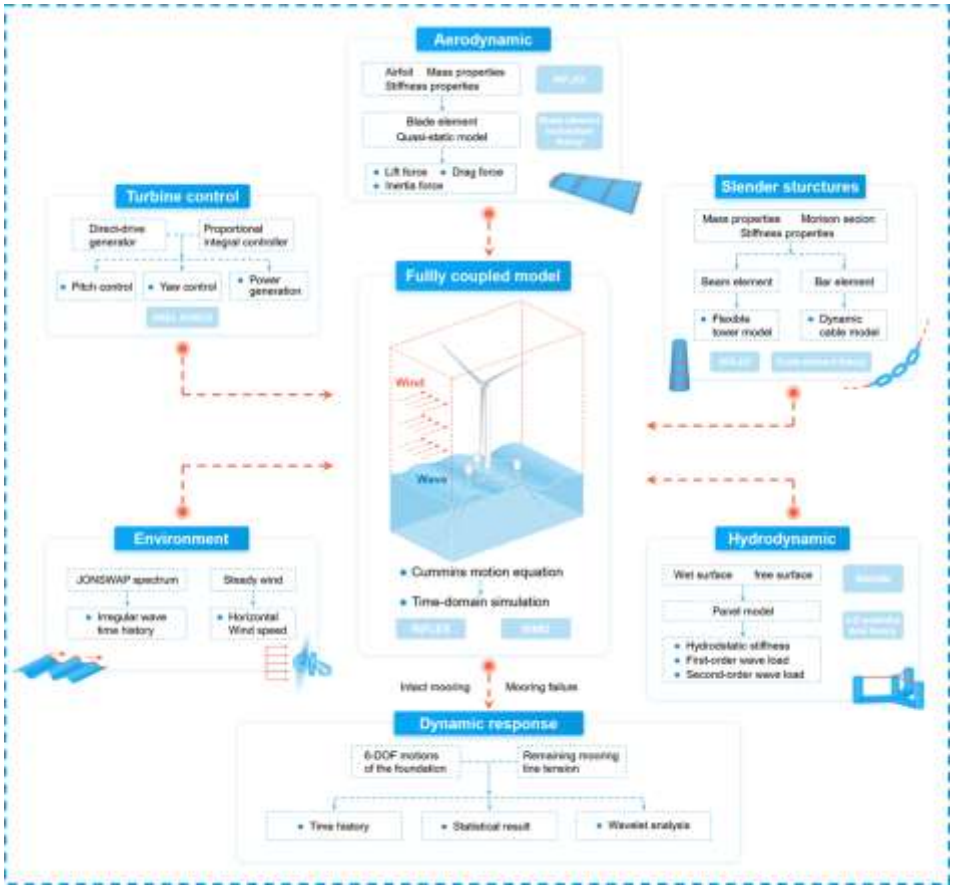
Şekil 17: Frekans düzlemli hesaplama akış şeması (Li vd., 2025a)

Ma vd., (2025) çalışmalarında, OC3-spar tipi yüzer rüzgâr türbininin rijit hareket ve hidroelastik tepkisine dayalı olarak kapsamlı bir tasarım optimizasyonu yapmışlardır. Çalışmada kullanılan yöntem, HYDRAN-XR yazılımı ile ABAQUS–MATLAB entegrasyonuna dayanmakta olup; dalga yükleri altında rijit ve esnek gövde davranışlarını eşzamanlı değerlendiren bir çok-amaçlı pareto-ön cephesi algoritması uygulanmıştır. Optimizasyon değişkenleri arasında alt silindirik kısmın çapı, cidar kalınlığı, su çekimi derinliği ve balast yüksekliği yer almış; amaç fonksiyonu ise yapının boyuna ötelenme (surge), dalıp-çıkma ve baş-kıç vurma yönlerindeki tepki genlik operatörlerinin (RAO) minimize edilmesi olarak belirlenmiştir. Hidroelastik analizde potansiyel akış teorisi ile sınır elemanlar yöntemi birleştirilmiş, deformasyonlar sonlu eleman modal üst üste bindirme tekniğiyle elde edilmiştir (Şekil 18). Optimizasyon sonucunda spar platformun $\gamma = 5{,}41$ incelik oranı ve CG = –54 m konfigürasyonu ile boyuna ötelenme, dalıp-çıkma ve baş-kıç vurma hareketlerinde %20–40 oranında azalma sağlanmıştır. Çalışma, rijit modellemenin mühendislik düzeyinde kabul edilebilir olduğunu, ancak gerilme ve yorulma analizlerinde hidroelastik etkilerin göz ardı edilmemesi gerektiğini vurgulamaktadır. Bu kapsamlı optimizasyon süreci günler süren analiz gerektirmiştir ve literatürdeki yüksek doğruluk derecesine sahip bu veriler, Reduced Order Model tabanlı hızlı tepki fonksiyonu oluşturma yaklaşımları için kritik bir eğitim veri kümesi niteliği taşımaktadır.



Şekil 18: Optimizasyon akış şeması (Ma vd., 2025)

Han vd. (2024), dalga ve rüzgâr enerjisini birlikte kullanan yüzer hibrit sistemlerin karmaşık dinamik davranışlarını çözümlemek amacıyla OFPA (OpenFAST-AQWA Python Architecture) adını verdikleri tam akuple aero-hidro-servo-elastik-mooring-multibody sayısal simülasyon çerçevesini geliştirmişlerdir (Şekil 19). Bu iş akışı, OpenFAST'in aerodinamik modüllerini ANSYS AQWA'nın hidrodinamik çözücüsüyle bütünleştirmiş, Python tabanlı harici kuvvet modülüyle PTO (Power-Take-Off) ve kılavuz-ray (guide-roller) sistemlerinin doğrusal olmayan etkileşimlerini modellemiştir. Geliştirilen model, 5 MW'lık OC4-DeepCwind tipi yarı batık platform ve heave tipi dalga enerjisi konverterlerin birleşiminden oluşan bir hibrit sistemde doğrulanmıştır. OFPA, farklı dalga-rüzgâr koşullarında sistemin altı serbestlik dereceli (6-DOF) hareketini, PTO sönüm etkilerini ve güç üretimini zamana bağlı olarak çözebilmiştir. Deneysel sonuçlarla yapılan karşılaştırmalar, OFPA'nın hem yüzer rüzgâr türbini hem de dalga enerjisi konverter bileşenlerinin hareket genliklerini yüksek doğrulukla tahmin ettiğini göstermiştir. Bununla birlikte, çalışmada bildirilen analizlerin her bir senaryosu için yüksek çözünürlüklü ağ yapısı ve paralel işlem desteği gerektiği, dolayısıyla birkaç gün süren hesaplama maliyetine sahip olduğu belirtilmiştir. Bu nedenle, bu tür tam akuple (FSI) simülasyonlardan elde edilen doğrulanmış veriler, ROM tabanlı yaklaşımların eğitimi ve doğrulanması açısından kritik öneme sahiptir; böylece benzer doğrulukta sonuçlar saniyeler içinde elde edilebilir.



Şekil 19: Hibrit sistem dinamik analizi için tam akuple aero-hidro-servo-elastik-demirleme-çok gövdeli sayısal simülasyon şeması (Han vd., 2024)

Li vd. (2025a) ve Li vd. (2025b), 15 MW yarı-batık (semi-submersible) VolturnUS-S tipi yüzer rüzgâr türbininde (Şekil 20) bir halat kopması sonrası meydana gelen dinamik davranışları analiz etmek üzere tam akuple aero-hidro-servo-elastik bir model geliştirmiştir. Model, BEM (Blade Element Momentum) teorisine dayalı aerodinamik yükleri, potansiyel akış teorisi ve Boundary Element Method (BEM) tabanlı hidrodinamik kuvvetleri, ayrıca sonlu eleman yöntemi (FEM) yaklaşımıyla modellenmiş halat dinamiklerini içeren SIMO–RIFLEX yazılımı üzerine kurulmuştur (Şekil 21). Çalışmada dört senaryo (normal, halat kopması + kule ekseni çevresinde dönme hatası, halat kopması + acil durdurma, aktif kontrol) ele alınmış; her biri için 6 serbestlik dereceli (6-DOF) hareketler ve kalan halat gerilmeleri zaman-frekans (wavelet) analiziyle incelenmiştir. Sonuçlar, halat kopması sonrası platformda düşük frekanslı "slow drift" hareketlerinin geliştiğini ve boyuna öteleme yönünde 776 m'ye kadar sapma oluşabileceğini göstermektedir. Ayrıca, acil durdurma manevrasının sürüklenmeyi azaltmakla birlikte sistemin yeniden dengeye gelme süresini uzattığı ve halat gerilmelerinde yüksek frekanslı yorulma bileşenlerini artırdığı belirtilmiştir. Bu kapsamlı simülasyonlar, her senaryo için yaklaşık birkaç bin saniyelik zaman adımıyla günler süren hesaplama yükü oluşturmuştur. Dolayısıyla, bu tür yüksek doğruluklu FSI analizleri, ROM tabanlı yöntemlerin eğitilmesi ve doğrulanması için kritik referans veriler sağlamaktadır; ROM sayesinde benzer senaryoların tepkisi gelecekte saniyeler içinde tahmin edilebilir hale gelebilecektir.

Şekil 20: Deniz üstü yüzer temelli rüzgâr türbininin ve demirleme sisteminin özellikleri. (Li vd., 2025b)

Şekil 21: İş akışı görünümü (Li vd., 2025b)

SONUÇ

Yüzer rüzgâr türbinlerinin dinamik davranışlarının doğru biçimde modellenebilmesi, aerodinamik, hidrodinamik, yapısal ve kontrol sistemlerinin birbirleriyle olan etkileşimlerinin bütüncül olarak ele alınmasını gerektirir. Bu kapsamda kullanılan tam akuple analizler (FSI – Fluid–Structure Interaction), sistemin altı serbestlik derecesine sahip karmaşık hareketlerini, dalga ve rüzgâr kaynaklı zamana bağlı yük değişimlerini ve geri besleme etkilerini eş zamanlı olarak çözebilmektedir. Ancak, bu tür yüksek doğruluklu analizlerin en büyük dezavantajı, çözüm sürelerinin uzunluğu ve hesaplama maliyetlerinin yüksekliğidir.

Bir yüzer türbin modeli, aerodinamik (rüzgâr alanı ve kanat yükleri), hidrodinamik (dalga kuvvetleri, radyasyon ve difraksiyon etkileri), yapısal (gövde ve kule deformasyonları) ve kontrol sistemleri (pitch–yaw kontrolleri, PTO sistemleri) olmak üzere dört ana bileşenin karşılıklı etkileşimini içerir. Bu bileşenlerin her biri için zamana bağlı denklemlerin eşzamanlı çözülmesi gerekir. Dolayısıyla çözüm süresi, modelin ağ yoğunluğu ve zamansal çözünürlüğü ile doğru orantılı olarak artar. Özellikle dalga spektrumlarının ve akış alanlarının üç boyutlu olarak modellenmesi, çözümün haftalarca sürebildiği durumlara yol açabilir.

Yüksek çözünürlüklü HAD veya FSI tabanlı bu analizlerin hesaplama maliyetleri, erken tasarım aşamalarında optimum türbin konfigürasyonlarının belirlenmesini zorlaştırır. Her senaryo için yüzlerce simülasyon yapılması gerektiğinde, sürecin toplam hesaplama yükü binlerce CPU-saat düzeyine ulaşabilir. Bu nedenle mühendislik uygulamalarında, tam akuple modellerin yalnızca doğrulama veya nihai tasarım aşamalarında kullanılması yaygın bir yaklaşımdır.

Bu noktada Reduced Order Model (ROM) yaklaşımları devreye girmektedir. ROM, yüksek çözünürlüklü sayısal modellerden veya deneysel verilerden elde edilen fiziksel ilişkileri indirgenmiş bir matematiksel yapı hâline getirerek, aynı sistem tepkilerini çok daha kısa sürede belirlemeyi amaçlar. Böylece, tam akuple bir analizin günler süren hesaplaması yerine, benzer doğrulukta sonuçlar saniyeler içinde elde edilebilir. ROM'un en büyük avantajı, yüksek doğruluk ile düşük hesaplama maliyetini birleştirmesidir. Bu sayede mühendislik süreçlerinde hızlı optimizasyon, çoklu senaryo analizi ve kontrol stratejilerinin gerçek zamanlı testleri mümkün hâle gelir.

Sonuç olarak, deniz üstü yüzer rüzgâr türbinlerinde tam akuple analizlerin fiziksel doğruluk açısından vazgeçilmez olduğu, ancak tasarım döngüsünde kullanılabilirliğini sınırlayan temel faktörün hesaplama maliyeti olduğu görülmektedir. Bu nedenle, tam akuple analizlerden elde edilen güvenilir verilerin indirgenmiş matematiksel modeller yani ROM aracılığıyla yeniden yapılandırılması, modern rüzgâr enerjisi mühendisliğinde hem hız hem de doğruluk dengesini sağlayan yeni bir paradigma olarak öne çıkmaktadır.

ÖZET

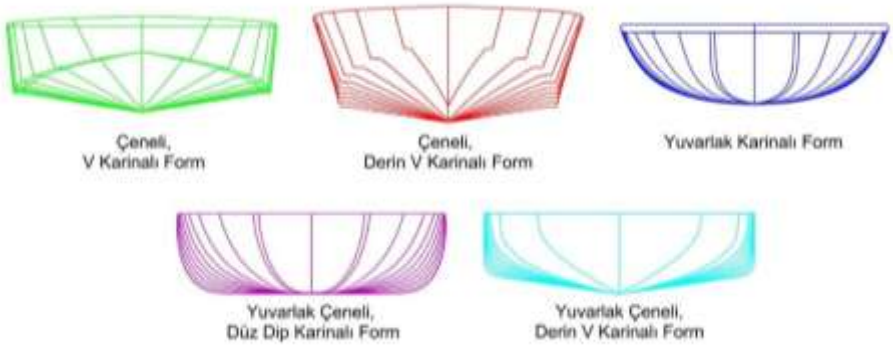
Yüksek süratli tekneler, yüksek hız ve manevra kabiliyetleri ile performans gereksinimlerini karşılamak amacıyla tasarlanarak üretilen teknelerdir. Bu nedenlerle seyir halinde, tekne gövdesinin hidrodinamik direncinin mümkün olduğu kadar az olması beklenir. Ancak, yüksek süratli tekneler, yalnızca yarış amacıyla tasarlanıp üretilmezler; günümüzde çoğunlukla eğlence amaçlı tekneler, devriye ve ambulans tekneleri de bu kapsamda üretilmektedirler. Bu çalışma, kademeli ve kademesiz gövdeli teknelerin hidrodinamik incelemesini ele alarak, kademeli gövde tasarımı ile ilişkili performans avantajlarını ve dezavantajlarını değerlendirmeyi amaçlamaktadır. Bu amaç doğrultusunda öncelikle modeller beş farklı gövde tipinde oluşturulmuştur. Bunlar arasından kayma rejimi için en uygun tekne modeli olan "çeneli derin V karinalı tekne" modeli seçilmiş, tekne, L=14 m boyunda kademeli ve kademesiz gövde formunda tasarlanarak ayrıntılı olarak incelenmiştir. Hesaplamalı akışkanlar dinamiği (HAD) simülasyonları kullanılarak yapılan çalışmada, viskoz ve dalga direncinin azaltılması, kaldırma kuvveti üretimi, kayma rejiminin verimliliği ve değişen çalışma koşulları altında stabilite gibi temel parametreler analiz edilmiştir. Bulgular, kademeli gövde konfigürasyonlarının ıslak yüzey alanını önemli ölçüde azalttığı ve bunun sonucunda hidrodinamik direncin azaldığı ve daha yüksek hızlarda kaldırma kuvvetinin arttığı yönündedir. Bununla birlikte, çalışma aynı zamanda bu avantajların, özellikle dönüş manevralarında, yetersiz dinamik stabilite ile tekne kontrol zorluklarını da birlikte getirebileceğini göstermektedir.

Anahtar Kelimeler: Yüksek süratli tekneler; Kademeli gövdeli kayıcı tekneler; Hidrodinamik direnç; HAD.

ANALYSIS OF HIGH-SPEED PLANING BOAT FORMS IN TERMS OF STEP DESIGN

ABSTRACT

High-speed boats are specifically designed to meet performance standards for speed and maneuverability. As a result, the hull is intended to minimize hydrodynamic resistance during cruising. However, high-speed boats are not only built for racing; today, they are mainly used as recreational, patrol, and ambulance vessels. This study aims to evaluate the performance benefits and drawbacks of stepped hull designs by examining the hydrodynamics of stepped and non-stepped hulls. For this purpose, models were initially created for five different hull types. Among these, the most suitable boat model for the planing regime was selected as the "Hard Chine Deep V" model, and the boat was designed with both stepped and non-stepped hull forms, each with a length of L=14 m, and examined in detail. Using computational fluid dynamics (CFD) simulations, the study analyzed key parameters such as the reduction of viscous and wave resistance, lift generation, planning efficiency, and stability under various operating conditions. The findings indicate that stepped hull configurations substantially decrease wetted surface area, leading to lower hydrodynamic drag and increased lift at higher speeds. However, the study also points out that these advantages can be offset by insufficient dynamic stability and hull control challenges, especially during turning maneuvers.



Keywords: High-speed boats; Stepped hull planing hulls; Hydrodynamic resistance; CFD.

GİRİŞ

Yüksek süratli tekneler, yüksek hız ve manevra kabiliyeti ile performans gereksinimlerini karşılamak amacıyla tasarlanarak üretilen teknelerdir. Bu nedenlerle tekne gövdesinin seyir halindeki hidrodinamik direncinin mümkün olduğu kadar düşük olması beklenir. Yüksek süratli tekneler, yalnızca yarış amacıyla tasarlanıp üretilmezler; günümüzde çoğunlukla eğlence amaçlı tekneler, devriye ve ambulans tekneleri de bu kapsamda üretilmektedirler

Yüksek hızlı teknelerde step (kademe), temel olarak hidrodinamik performansı ve stabiliteyi iyileştirmek amacıyla tekne gövdesine eklenen stratejik bir kesinti veya basamaktır. Bu tasarımın en kritik işlevi, teknenin altından geçen su akışını kontrollü bir şekilde ayırarak, gövdenin ıslak yüzey alanını ve dolayısıyla sürtünme (viskoz) direncini önemli ölçüde azaltmaktır. Step aynı zamanda, teknenin hızlandıkça doğal olarak yükselmesini (trim) kolaylaştırarak, daha verimli bir kayma rejimine daha çabuk geçiş sağlar. Bu sayede aynı motor gücüyle daha yüksek süratlere ulaşılabilir veya aynı hız için daha az güç ve yakıt tüketilir. Ek olarak, step, hava cebi oluşturarak su ile gövde arasına hava karışımını teşvik eder ve bu da direnci daha da düşürür. Sonuç olarak, step tasarımı, yüksek hızlı teknelerde hız, verimlilik, yakıt ekonomisi ve deniz tutuşu arasında optimal bir denge kurmak için vazgeçilmez bir mühendislik çözümüdür.

Bu çalışma, kademeli (stepli) ve kademesiz gövde konfigürasyonlarının hidrodinamik karakteristiklerini karşılaştırmalı bir yaklaşımla ele alarak, step geometrisinin performans üzerindeki etkilerini avantajları ve sınırlılıklarıyla birlikte ortaya koymayı hedeflemiştir. Araştırmanın başlangıç aşamasında, kayma (planing) rejiminde yüksek performans sunduğu değerlendirilen "çeneli derin V" karina formu, beş farklı gövde alternatifi arasından tercih edilmiş; bu form esas alınarak 14 m boyunda, biri kademeli diğeri kademesiz olmak üzere iki ayrı model oluşturulmuş ve söz konusu modeller ayrıntılı HAD (Hesaplamalı Akışkanlar Dinamiği) analizlerine tabi tutulmuştur.

Şekil 1: Çalışma kapsamında geliştirilen yüksek süratli teknelerin enkesitleri

1.STEP TASARIMI

1.1 Step Tasarımının Önemi, Amacı ve Çalışma Prensibi

Step tasarımının başarısı, yalnızca varlığına değil, aynı zamanda üç temel parametrenin titizlikle optimize edilmesine bağlıdır: açısı, yüksekliği ve tekne boyunca konumu. Step açısı, genellikle tekne taban çizgisine hafif açılı ayarlanır; suyun temiz bir şekilde ayrılmasını sağlamalı, ancak aşırı olmamalıdır. Çok dik bir açı suyu keser ancak türbülans ve dengesizliğe yol açabilir ken, çok sığ bir açı etkisiz kalabilir. Step yüksekliği ise gövde ile su arasında oluşacak hava cebinin boyutunu ve etkinliğini doğrudan belirler. Yetersiz yükseklik istenen direnç azalmasını sağlamaz, aşırı yükseklik ise teknenin dengesini bozabilir ve inişlerde (örn.

dalga üstünde seyir) yapısal strese neden olabilir. En kritik parametrelerden biri olan step konumu, teknenin ağırlık merkezi ve hidrodinamik kaldırma merkezi ile uyum içinde belirlenmelidir. Teknenin doğal trim açısını ve kalkış (planing) anında ki davranışını doğrudan etkiler. Çok geride olması burnun aşırı yükselmesine (bow-up), çok önde olması ise teknenin düz ve verimsiz bir şekilde seyretmesine neden olabilir. Bu üç parametrenin birbiriyle senkronize şekilde ayarlanması, maksimum performans, yakıt verimliliği ve güvenli seyir için hayati önem taşır.

1.2 Step Tasarım Parametreleri

Step açısının seçimi, teknenin öncelikli performans hedefine göre belirlenir: 1-2° dengeli hız ve verimlilik, 0.5-1.5° üstün stabilite, 2-3° erken kalkış, 3-5° ise maksimum hız için tercih edilir. Step yüksekliği ise tekne boyutu ve performans beklentisiyle doğrudan ilişkilidir. 10 mm'den az bir yükseklik küçük teknelerde minimal etki sağlarken, 10-25 mm aralığı 6-12 metrelik teknelerde genel kullanım için optimum dur. 25-50 mm gibi daha yüksek değerler ise yüksek performans ve yarış teknelerinde maksimum hava cebi oluşumu ve direnç azaltılması için kullanılır.

En kritik parametrelerden biri olan step konumu, genellikle teknenin pruvasından (burun ucundan) itibaren tekne boyunun (L) belirli bir yüzdesi olarak ifade edilir. Planing teknesi hidrodinamiği nin temel prensiplerine (Savitsky, 1964; Fridsma, 1969) göre, stepin ağırlık merkezinin (CG) gerisinde yer alması esastır. Endüstriyel uygulamada ve tasarım kılavuzlarında, optimum konum için pruvadan itibaren yaklaşık %55 ile %65 L aralığı yaygın bir kabul görmüştür. Bu aralık, teknenin kalkış (planing) anında istenen trim açısına ulaşmasını ve gövdenin arka kısmının verimli bir şekilde kaldırma kuvveti üretmesini sağlar. Konumun bu aralığın önüne kaydırılması, teknenin düz ve verimsiz seyretmesine yol açarken; çok geriye alınması ise burnun aşırı yükselmesine, dümen etkisinin azalmasına ve dengesizliğe neden olabilir. Nihai konum, ağırlık dağılımı, motor yeri ve detaylı hidrodinamik analizlerle kesinleştirilir.

1.3 Step Konfigürasyonları

Step tasarımı, teknenin boyutuna ve performans hedefine bağlı olarak tek step veya çoklu step konfigürasyonları ile uygulanır. Tek step (genellikle 4-8 metrelik teknelerde), basit tasarımı, nispeten düşük imalat maliyeti ve kolay bakımı sayesinde tercih edilir. Önerilen konfigürasyon olarak, bu boyuttaki teknelerde stepin ağırlık merkezinin (LCG) %40-50 gerisine konumlandırılması, dengeli bir kalkış ve seyir performansı sağlar. 8 metreden daha uzun ve özellikle yüksek hız odaklı teknelerde ise, çoklu step (genellikle 2 veya 3 step) tasarımı öne çıkar. Bu konfigürasyon, ıslak yüzey alanını daha kademeli ve kontrollü bir şekilde azaltarak üstün yüksek hız performansı, optimize edilmiş kaldırma kuvveti dağılımı ve daha iyi stabilite sağlar. Örneğin, 8-12 metrelik tekneler için iki step (%30-40 ve %60-70 LCG konumları), 12-15 metrelik tekneler için ise iki veya üç step (%25-35, %50 ve %65-75 LCG) önerilen genel konfigürasyon lardır. Çoklu step tasarımı, karmaşık imalatı ve bakım zorluğuna rağmen, kritik performans parametrelerinde sağladığı belirgin avantajlar nedeniyle profesyonel ve yarış amaçlı teknelerde standart hale gelmiştir.

1.4 Stepli ve Stepsiz Gövde Performans Karşılaştırması

Step tasarımının etkinliği, teknenin çalışacağı Froude Sayısı (Fn) ile doğrudan ilişkilidir ve doğru konfigürasyon seçimi için bu kritik bir belirleyicidir. Düşük hızlarda ($Fn < 0.5$) stepsiz gövdeler, optimize direnç, üstün stabilite ve basit yapısıyla avantajlı iken, step bu rejimde sınırlı etki gösterir veya hatta direnci artırabilir. Orta-hızlı planing rejimine ($Fn = 0.5$-1.0) geçişte step avantajları belirginleşir. Doğru tasarlanmış bir step, bu hız bandında yakıt tüketiminde %15-

30'a varan azalma ve %10-20 hız artışı sağlayabilir. Yüksek hızlarda (Fn > 1.0) ise çoklu step konfigürasyonu maksimum verim için zorunlu hale gelir; ıslak yüzeyi dramatik şekilde azaltarak keskin manevra ve dinamik dönüş kabiliyeti kazandırır.

1.5 Kritik Tasarım Noktaları

Step yanlış tasarlandığında ciddi riskler doğurur: düşük hızda performans kaybı, kontrolü zor salınımlar (porpoising), yapısal zayıflık ve titreşim artışı. Bu riskleri bertaraf etmek için, CFD simülasyonlarıyla doğrulanmış tasarım, yapısal analiz entegrasyonu ve prototip testleri şarttır. Nihayetinde, step tasarımı, teknenin operasyonel profilini doğru analiz ederek, basitlik ve dayanıklılık (stepsiz) ile yüksek performans ve verimlilik (stepli) arasında bilinçli bir mühendislik tercihi yapmayı gerektirir.

2. TASARLANAN MODELLER

2.1 Stepsiz Model

Bu çalışma için hazırlanan model, boyutları ve formu ile tipik bir yüksek performans teknesini temsil eden 14 metre uzunluğunda, Hard Chine (çeneli) Deep-V (derin V) karinalı bir tekne gövdesidir. Modelin ana boyutları (14m x 3.1m genişlik x 1.3m derinlik) ve hidrostatik özellikleri (0.85m draft, 0.4 boy konumunda 14° deadrise açısı ve 13,500 kgf deplasman), analizlerin gerçekçi bir temel üzerinde yürütülmesini sağlamak üzere belirlenmiştir.

Şekil 2-Stepsiz 14m Hard Chine Deep V tipi Gövde Modeli

2.2 Stepli ve Spray Railli Model

Stepin etkisini yalnızca gövde geometrisindeki değişiklik üzerinden izole bir şekilde incelemek için, aynı temel boyutlara ve deplasmana sahip, ancak gövdesine 100 mm yüksekliğinde ve 5° açıya sahip bir step ile spray rail (sıçrama oluğu) eklenmiş bir varyant model oluşturulmuştur. Bu 5°'lik agresif step açısı, modelin maksimum hız ve planing performansı hedeflediğini göstermektedir. İki model arasındaki bu tek fark (step varlığı/yokluğu), HAD (Hesaplamalı Akışkanlar Dinamiği) simülasyonları aracılığıyla, stepin direnç, kaldırma kuvveti, stabilite ve

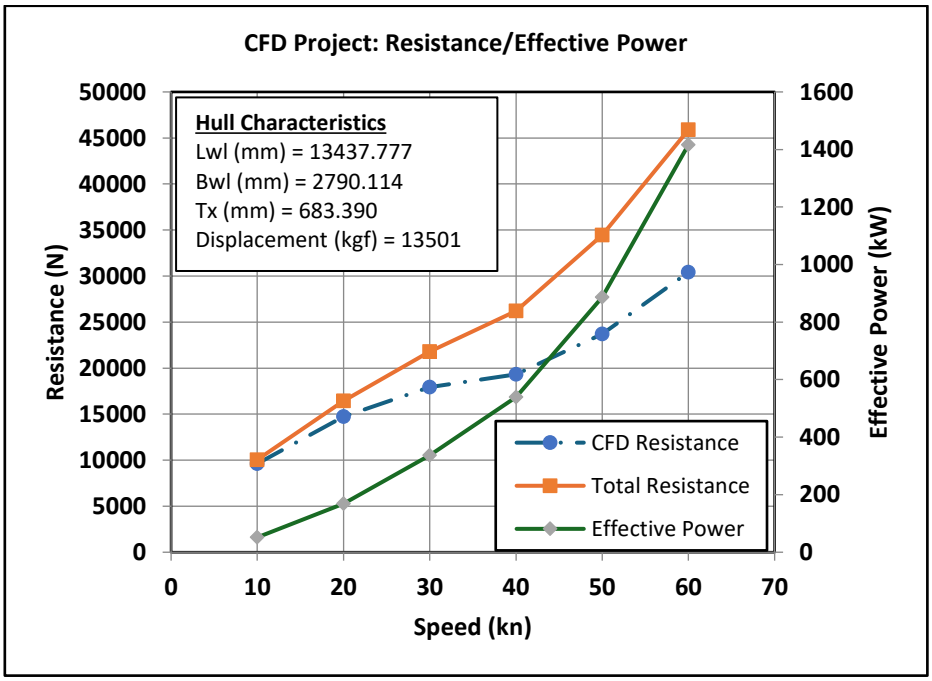
verimlilik üzerindeki saf etkisinin doğrudan ve niceliksel olarak karşılaştırılabilmesine olanak tanımaktadır.

Şekil 3-Step ve Spray Railli 14m Hard Chine Deep V tipi Gövde Modeli

3. HİDRODİNAMİK ANALİZ VE SONUÇLAR

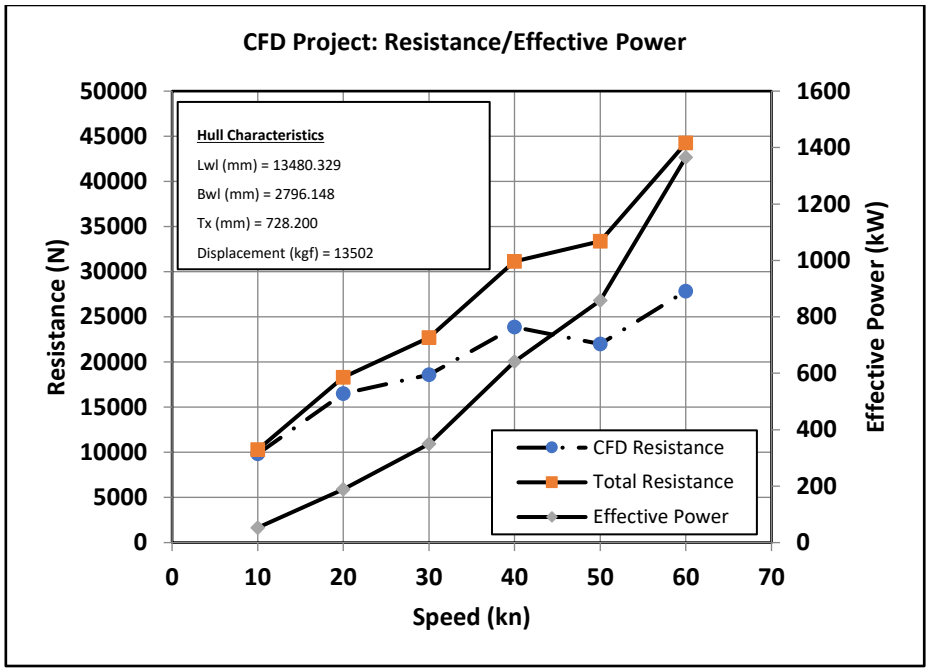
3.1 Analiz Yöntemi ve Parametreleri

Bu araştırmada kullanılan sayısal analizlerin temeli, Simerics 6.04 sürümü ile atılmıştır. Yazılım, serbest yüzey izleme için VOF yöntemini içeren RANS tabanlı bir çözücü olup, sonuçlarının geçerliliği mevcut deneysel ölçümlerle karşılaştırılarak kontrol edilmiştir. Modellemede, yakın duvar bölgelerinin fiziksel olarak doğru şekilde temsili için yazılıma özgü geliştirilmiş 'standart' duvar fonksiyonlarından yararlanılmıştır. Çözüm algoritmasının çekirdeğinde, Basınç Bağlantılı Denklemler için Yarı Örtülü Yöntem yer almakta olup, buna ek olarak yazılıma entegre edilmiş ve literatürde geçerliliği kanıtlanmış özel bir k-ε türbülans modeli kullanılmıştır (Borowski, 2022; Wang ve ark., 2018, 2019a, 2019b).



Tekne yüzeyi, kaymaz duvar sınır koşulu ile tanımlanmış ve yüzey pürüzlülüğü, ITTC (2014) kılavuzuna uygun olarak 150 mikron değerinde sabitlenmiştir. Hesaplama ağının oluşturulmasında, yazılımın tescilli ve tam otomatik İkili Ağaç Ağı yöntemi tercih edilmiştir. Bu yaklaşım, hesaplama bölgesini tek bir hücreden başlayıp, önceden belirlenmiş çözünürlük kriterleri sağlanana kadar yapısal olarak alt bölümlere ayırarak optimize edilmiş bir ağ yapısı üretir (Borowski, 2022; Wang ve ark., 2018, 2019a, 2019b).

14 metre boyundaki çeneli derin V karinalı yüksek hızlı bir gezinti teknesi üzerinde yapılan Hesaplamalı Akışkanlar Dinamiği (HAD) analizi sonuçları, mevcut ISO kurallarına dayalı hesaplamalarla mertebe olarak benzerlik gösterse de, önemli niceliksel farklılıklar tespit edilmiştir. HAD simülasyonların dan elde edilen basınç dağılımı, teknenin baş kısmına doğru azalma eğilimi sergilerken, ISO kurallarından türetilen değerler ise mastori bölgesinden sonra sabit kalmakta ve bu nedenle HAD verileriyle tam bir uyum sağlanamamaktadır. Daha da önemlisi, ISO kurallarına göre belirlenen basınç değerlerinin aşırı yüksek olması, teknenin gereğinden fazla dirençli ve dolayısıyla ağır imal edilmesine yol açma riski taşımaktadır. Bu durum, hem malzeme israfına hem de performans kaybına neden olabileceğinden, ilgili



standardın yetkili kurum tarafından gözden geçirilmesi ve HAD gibi modern analiz yöntemlerinin bulguları doğrultusunda güncellenmesi gerekmektedir.

3.2 Analiz Sonuçlar

Analiz sonuçları, 40 knot'a (kn) kadar olan hız bölgesinde step içeren ve içermeyen teknelerin benzer bir direnç artış eğrisi izlediğini, ancak stepin varlığının bu aralıkta direnci %2 ile %15 arasında artırdığını ortaya koymaktadır. Performans dönüm noktası, 50 kn'ın üzerindeki yüksek hızlarda gerçekleşmektedir. Bu hız bandında, stepli tekne, dirençte stepsiz tasarıma kıyasla yaklaşık %4'lük bir azalma sağlayarak avantajlı konuma geçmektedir. Maksimum hız olan 50 kn'da yapılan ölçümlerde, stepsiz modelin toplam direnci (RT) 34,46 kN iken, stepli modelin direnci 33,36 kN olarak kaydedilmiştir. Bu durum, gerekli efektif güç (PE) değerlerine de yansımış; stepsiz tekne için 886,4 kW, stepli tekne için ise 858,1 kW hesaplanmıştır. Her iki konfigürasyon için de, tipik işletme koşullarında yaklaşık 1450 kW nominal gücünde bir motorun yeterli olacağı görülmüştür. Hidrodinamik stabilite açısından her iki tekne de 50 kn hızda olumlu performans sergilemiştir. Stepsiz ve stepli modeller, su seviyesinden sırasıyla yaklaşık 419 mm ve 441 mm yükselerek, sadece 1,5°'lik bir baş-kıç vurma (trim) açısıyla oldukça dengeli bir kayma (planing) rejimine girmişlerdir. Her iki teknenin de 50 kn'da karakteristik bir çeneli derin V teknesi davranışı sergilediğini doğrulamaktadır.

Şekil 4: Yüksek süratli stepsiz tekne formunun sakin su performans

Şekil 5: Yüksek süratli stepli tekne formunun sakin su performans

SONUÇ

Bu araştırma, kademeli (stepli) ve kademesiz gövde tasarımlarının hidrodinamik davranışlarını karşılaştırmalı olarak inceleyerek, stepin performansa etkilerini avantaj ve dezavantajlarıyla ortaya koymayı amaçlamıştır. Çalışmanın ilk aşamasında, kayma (planing) rejimi için en uygun olduğu değerlendirilen "çeneli derin V" karinalı form, beş farklı gövde tipi arasından seçilmiş ve bu formda 14 metre boyunda hem step içeren hem de içermeyen iki ayrı model geliştirilerek detaylı HAD analizlerine tabi tutulmuştur.

Mevcut ISO kuralları çerçevesinde, söz konusu 14 metrelik tekne için 50 knot hızdaki dinamik basıncın tekne boyunca sabit kabul edildiği görülmüştür. HAD analizleri ile ISO kurallarından elde edilen basınç dağılım trendleri genel olarak örtüşmek ile birlikte, ISO değerlerinin önemli ölçüde daha yüksek ve muhafazakâr olduğu tespit edilmiştir. Bu bulgu, mevcut standartlar kapsamında belirlenen profil ve sac kalınlıklarında, yapısal bütünlükten ödün vermeden kontrollü bir iyileştirme yapılabileceğine işaret etmektedir. Böyle bir optimizasyon, hem malzeme-ağırlık azaltımı hem de üretim maliyetlerinde düşüş sağlayacak; bu da daha düşük motor gücüyle aynı performansa ulaşılmasına, dolayısıyla yakıt tüketimi, işletme maliyetleri ve egzoz emisyonlarının azaltılmasına olanak tanıyacaktır.

Öte yandan, çalışmanın sonuçları stepin özellikle yüksek hızlarda (50 kn üzeri) ıslak yüzeyi ve dolayısıyla hidrodinamik direnci belirgin şekilde düşürdüğünü ve kaldırma kuvvetini artırdığını ortaya koymuştur. Ancak, bu avantajların elde edilmesi için step konumu, tekne ağırlık merkezi ve ağırlık dağılımının son derece hassas hesaplanması gerekmektedir. Ayrıca, step içeren teknelerin dönüş manevralarında dinamik stabilite de gözlemlenen azalma ve ortaya çıkabilecek kontrol zorluklarının da tasarım aşamasında dikkatle ele alınması gerektiği anlaşılmıştır.

ABSTRACT

The digitalization of global communication has transformed the semiotic foundations of branding, altering how meaning is created, circulated, and interpreted in networked societies. This study explores the **new semiotics of branding** arising from the convergence of participatory culture, algorithmic mediation, and data-driven personalization. Traditional semiotic models, grounded in stable sign–meaning relationships, no longer explain the fluid and interactive brand meanings of the digital age. Using an **interpretivist qualitative design**, the study integrates a **systematic literature review**, **critical discourse analysis**, and **digital semiotic mapping** of major brand cases such as Nike, Coca-Cola, Gucci, and Netflix. Classical semiotic theories (Peirce, Barthes) are synthesized with contemporary digital frameworks (Manovich, Holt, Couldry & Hepp) to develop a new conceptual model—the **Digital Semiotic Loop**—illustrating how brand meaning emerges through recursive interaction between consumers, algorithms, and data systems. Findings reveal three defining dimensions of digital brand semiotics: **participatory semiotics**, where users co-create symbolic value; **algorithmic semiotics**, where meaning is filtered through platform logics; and **reflexive semiotics**, where data analytics reshape brand identity in real time. The study concludes that digitalization democratizes meaning-making while embedding it within algorithmic power structures, creating both opportunities for engagement and ethical risks of manipulation. The research contributes a theoretical and practical framework for understanding branding as a **semiotic ecosystem**, emphasizing transparency, cultural sensitivity, and algorithmic accountability in digital brand management.

Keywords: Development, Digital, Marketing, Media, Transformation

1.0 Introduction

1.1 Background of the Study

Over the past two decades, the rapid advance of digital technologies has fundamentally altered how brands communicate, signify value, and build relationships with consumers. Branding, traditionally rooted in visual identity and symbolic consistency (Kapferer, 2013), is now a fluid, interactive, and data-driven process shaped by digital platforms, social media algorithms, and consumer co-creation (Holt, 2016; Manovich, 2020). In the analog era, brands were primarily constructed through one-way communication—advertising campaigns, logos, and narratives carefully curated by organizations. However, with the rise of digitalization, branding has transformed into a multimodal semiotic process, where meaning emerges through the interaction of text, image, emoji, video, and algorithmic mediation (Fatima *et al*., 2025; Makhachashvili *et al*., 2022; Ghidoli & Montanari, 2021; Carah, & Brodmerkel, 2020).

Digitalization not only multiplies the modes of signification but also redefines how brand meaning is produced, circulated, and interpreted. Platforms such as TikTok, Instagram, and X (formerly Twitter) function as semiotic arenas where users continuously remix and reinterpret brand symbols. This has given rise to "participatory semiotics", where consumers become "meaning-makers," co-constructing brand identity alongside corporations (Wichmann *et al*., 2022; Arvidsson & Caliandro, 2016). Additionally, algorithmic branding—the use of AI-driven personalization and data analytics—has introduced a new layer of semiotic mediation, where meaning is not only socially negotiated but also computationally filtered (Barta & Andalibi, 2024).

In this evolving digital ecosystem, the semiotic function of brands extends beyond communication to cultural navigation—helping users locate themselves within digital spaces of identity, belonging, and aspiration. Understanding this transformation is essential for scholars and practitioners seeking to decode how brand meaning operates in a digitized world characterized by information abundance, algorithmic filtering, and cultural fragmentation.

1.2 Problem Statement

Despite the growing recognition of digitalization's impact on branding, there remains a significant gap in understanding how digital environments reshape the semiotics of brand meaning. Traditional semiotic models—such as Peirce's triadic framework or Barthes' mythologies—were developed in pre-digital contexts, focusing on stable relationships between signs, objects, and meanings. These models are increasingly inadequate for analyzing dynamic, interactive, and algorithmically mediated digital semiotics (Berlanga-Fernández & Reyes, 2024).

The central problem lies in the lack of a comprehensive theoretical framework that captures how digitalization alters semiotic processes in branding. Specifically:

- How do algorithmic and participatory forms of communication redefine brand meaning?
- What new semiotic structures emerge when consumer-generated content and AI-driven personalization converge?
- How can brands ethically navigate meaning-making in environments mediated by algorithms and data?

Without addressing these questions, both scholars and practitioners risk relying on outdated conceptual tools that fail to account for the complexities of digital brand communication.

1.3 Justification of the Study

This study is justified by the increasing dominance of digital semiotic environments in contemporary marketing. Brands no longer exist merely as corporate constructs but as cultural codes circulating across social, algorithmic, and symbolic networks (Couldry & Hepp, 2018). Understanding how these codes are generated and interpreted in digital contexts is crucial for maintaining brand relevance, authenticity, and trust (Pan & Sun, 2024).

Moreover, the study contributes to the growing field of digital semiotics, providing a necessary bridge between semiotic theory and digital media practice. By mapping how digitalization transforms sign systems, the study offers strategic and ethical insights into how brands can operate transparently and sustainably in data-driven cultures (Zuboff, 2023).

From a policy perspective, this research also supports the development of regulatory frameworks that address algorithmic manipulation, semiotic bias, and misinformation in branding communication. As AI-generated content proliferates, understanding the semiotic consequences of automation becomes vital for protecting consumers from deceptive or manipulative practices.

1.4 Research Objectives

The overarching aim of this review is to explore and conceptualize the new semiotics of branding in the digital age. Specifically, the objectives are:

1. To analyze how digitalization transforms the semiotic processes involved in branding.
2. To identify the key semiotic mechanisms—such as participatory culture, algorithmic mediation, and data-driven feedback—that shape brand meaning in digital environments.
3. To develop a conceptual framework explaining the interaction between digital technologies and brand semiotics.
4. To examine the ethical and cultural implications of algorithmic semiotics in branding.
5. To provide practical and policy-oriented recommendations for managing digital brand communication in ethically responsible and culturally sensitive ways.

2.0 Theoretical Framework

The theoretical foundation for understanding the new semiotics of branding in the digital age draws from a convergence of three major traditions:(1) Classical Semiotic Theory, (2) Post-Structuralist and Cultural Semiotics, and (3) Digital Media and Algorithmic Communication Theory.

Together, these frameworks illuminate how digitalization transforms meaning-making processes, decentralizes brand authorship, and introduces algorithmic agents as semiotic co-producers.

2.1 Classical Semiotic Foundations

The roots of branding semiotics trace back to the foundational works of Ferdinand de Saussure (1916) and Charles Sanders Peirce (1931), whose models conceptualized meaning as a system of relationships between signs and their referents.

Saussure viewed the sign as a dyadic structure composed of the *signifier* (the form of the word, image, or symbol) and the *signified* (the concept it represents). Applied to branding, the logo, slogan, or visual identity acts as the signifier, while the brand's perceived image—such as trust, quality, or innovation—serves as the signified (Kapferer, 2013).

Peirce's triadic model, on the other hand, includes three components: the *sign* (or representamen), the *object* (what the sign refers to), and the *interpretant* (the meaning generated by an interpreter). In digital branding, the interpretant extends beyond human cognition to include algorithmic systems—AI-driven recommendation engines, personalization tools, and data-analytics models—that interpret and recirculate brand meanings (Pan & Sun, 2024).

From this classical perspective, brands function as semiotic systems that produce, organize, and communicate meanings within cultural and economic contexts. However, these traditional models presuppose relative stability and control over meaning—conditions that digitalization has disrupted.

2.2 Post-Structural and Cultural Semiotics

Post-structuralist theorists such as Roland Barthes (1977) and Umberto Eco (1986) challenged the notion of fixed meanings, emphasizing the polysemic and culturally constructed nature of signs. Barthes proposed that all cultural texts, including advertisements and brand messages, operate within a "mythological" system where signs convey ideological meanings. For instance, a brand like Apple signifies not merely technology but also creativity, rebellion, and lifestyle aspirations—a modern myth reinforced by consumer participation.

In the context of digitalization, meaning is further destabilized. The semiotic process becomes dialogic, participatory, and decentralized. Consumers actively reinterpret, remix, and reframe brand signs through hashtags, memes, and user-generated content (Wichmann et al., 2022; Arvidsson & Caliandro, 2016). Thus, the post-structuralist notion of *intertextuality*—the interweaving of multiple discourses—now manifests as "hypertextuality", where brand meaning evolves through endless digital recombination (Berlanga-Fernández & Reyes, 2024).

Semiotic scholars such as Floch *et al*. (2001) and Mick *et al*.(2018) argue that brand meaning depends on *semiotic anchorage*—the mechanisms that stabilize interpretation. In digital spaces, this anchorage becomes unstable due to the continuous feedback loops of social sharing, algorithmic amplification, and cultural reinterpretation (Makhachashvili *et al*., 2021). Hence, post-structural semiotics provides a crucial theoretical bridge to understanding how meaning is continuously produced and negotiated in digital environments.

2.3 Digital Media Theory and Algorithmic Semiotics

Digitalization introduces a new dimension to semiotics—algorithmic mediation—where technology itself becomes an active participant in meaning construction. According to Lev Manovich (2020) and Couldry & Hepp (2018), digital media systems reconfigure cultural communication by embedding semiotic processes within computational architectures.

Algorithms curate what users see, shaping brand narratives through visibility, personalization, and engagement metrics (Fatima *et al*., 2025). This phenomenon gives rise to what Arvidsson (2018) calls *algorithmic value production*, in which meanings are dynamically ranked, filtered, and optimized for attention economies. Brands therefore exist within datafied semiotic ecologies—environments where meaning is both interpreted by audiences and processed by machine learning systems (Pan & Sun, 2024).

This dynamic introduces the concept of "algorithmic interpretants", where interpretation is no longer solely human but mediated through code. For instance, YouTube's recommendation algorithm decides which branded content is amplified, thus influencing what meanings gain traction and which fade into obscurity. The algorithm becomes a *semiotic agent*—a non-human interpreter that participates in meaning-making (Pan & Sun, 2023).

Additionally, Cultural Analytics Theory (Manovich, 2020) suggests that data visualization, AI pattern recognition, and sentiment analysis are new forms of semiotic inquiry. They transform qualitative meaning into quantifiable patterns, reshaping how marketers read and respond to cultural signs. The semiotic act is thus not only interpretive but also computational.

2.4 Integrative Semiotic Model for Digital Branding

Building on these traditions, the theoretical synthesis of this review proposes a digital semiotic branding model grounded in three interacting layers (Table 1).

Table 1: A digital semiotic branding model grounded in three interacting layers

Theoretical Layer	Core Concept	Digital Manifestation	Representative Scholars
Structural Semiotics	Meaning as relation between signifier and signified	Logos, icons, hashtags as digital signifiers	Saussure (1916); Peirce (1985)
Post-Structural Semiotics	Meaning as fluid, contested, and intertextual	User-generated reinterpretations and brand remixes	Barthes (1977); Eco (1986); Arvidsson (2018)
Algorithmic Semiotics	Meaning mediated by code and computation	AI-curated brand narratives; data-driven personalization	Manovich (2020); Pan & Sun (2024)

Source: Authors' own compilation, 2025

This framework shows that brand meaning in the digital era arises through interactions among human creativity, cultural discourse, and algorithmic computation. Brands no longer control meaning; they *curate* it through continuous engagement and adaptation to algorithmic cultures.

2.5 Theoretical Implications

1. From sender to system: Branding shifts from a unidirectional message transmission to an eco-semiotic system where meaning emerges through networks of signs, data, and users (Zuboff, 2023; Holt, 2016).

2. From authorship to co-creation: Consumers, influencers, and algorithms become co-authors of brand identity, eroding traditional corporate control over semiotic narratives.

3. From representation to computation: The act of interpreting signs is increasingly automated, quantifying meaning through engagement metrics, sentiment scores, and predictive analytics.

These implications provide a conceptual bridge to the Conceptual Framework section, which operationalizes these theoretical principles into an analytical model for understanding the evolving semiotic mechanisms of digital branding.

3.0 Conceptual Framework

3.1 Overview

The conceptual framework builds upon the theoretical synthesis of structural, post-structural, and algorithmic semiotics to explain how brand meaning is constructed, mediated, and circulated in the digital era. It proposes that digitalization transforms branding from a linear communication model into a dynamic, interactive semiotic ecosystem — one characterized by the continuous exchange of signs between brands, consumers, and algorithms.

In this ecosystem, brands no longer act as sole producers of meaning; rather, they operate as *participants* in a network where meaning emerges through constant negotiation, adaptation, and computational mediation. The framework identifies three interdependent domains of semiotic transformation:

1. Participatory semiotics (human interaction)
2. Algorithmic mediation (technological interaction)
3. Data-driven reflexivity (analytical feedback)

Together, these domains form a Digital Semiotic Loop, which captures how brand meanings evolve through iterative human–machine–data interactions.

3.2 Components of the Conceptual Framework

(a) Participatory semiotics: consumer co-creation of meaning

Digitalization empowers consumers to become active semiotic agents, transforming them from passive receivers of brand messages into co-creators of meaning. Through digital platforms, audiences contribute to the brand's symbolic repertoire via memes, hashtags, reviews, emojis, and digital storytelling (Arvidsson & Caliandro, 2016).

This participatory dynamic gives rise to what Jenkins *et al*.(2019) terms *"convergence culture"*, where user-generated content, brand narratives, and platform affordances intersect to produce hybrid semiotic meanings. For example:

- Consumers reinterpret brand campaigns through *memetic semiotics* on TikTok and Instagram.
- Influencers act as semiotic intermediaries, re-signifying brands through personal narratives.
- Brand communities on Reddit or Discord construct collective symbolic meanings through discussion and remixing.

In short, participatory semiotics decentralizes brand authorship, making meaning plural, fluid, and co-owned.

(b) Algorithmic mediation: machine-coded meaning distribution

The second domain, algorithmic mediation, recognizes that digital algorithms — from recommendation systems to engagement ranking — play a central role in determining *which* brand signs gain visibility and *how* they circulate. Algorithms thus function as non-human semiotic agents (Pan & Sun, 2024).

This mediation occurs at three levels:

1. Selection: Algorithms decide what content (e.g., brand posts or videos) appears on feeds.
2. Amplification: Engagement-driven algorithms amplify specific semiotic patterns — often privileging emotional, sensational, or viral content.
3. Personalization: Data analytics personalize meaning according to user preferences, creating *micro-semiotic worlds* where each consumer experiences a slightly different brand identity (Carah & Brodmerkel, 2020).

Thus, algorithms do not merely transmit meaning — they *transform* it by privileging certain interpretations and suppressing others, effectively rewriting brand semiotics in real time.

(c) Data-driven reflexivity: feedback and semiotic adaptation

The third domain, data-driven reflexivity, captures how brands use data analytics and AI-based insights to monitor and adapt their semiotic performance. Through social listening, sentiment analysis, and cultural analytics, brands continually interpret the interpretants — i.e., they "read" how audiences read them (Manovich, 2020).

This creates a *reflexive loop* where:

- Data becomes a semiotic input, shaping brand decisions.
- Metrics such as engagement, sentiment, and virality serve as *quantified interpretants*.
- Machine learning systems predict cultural trends and adjust brand messaging accordingly (Siregar *et al*., 2023; Gensler *et al*., 2013).

Consequently, meaning is no longer static but algorithmically responsive — evolving through real-time feedback loops between human and machine interpretations.

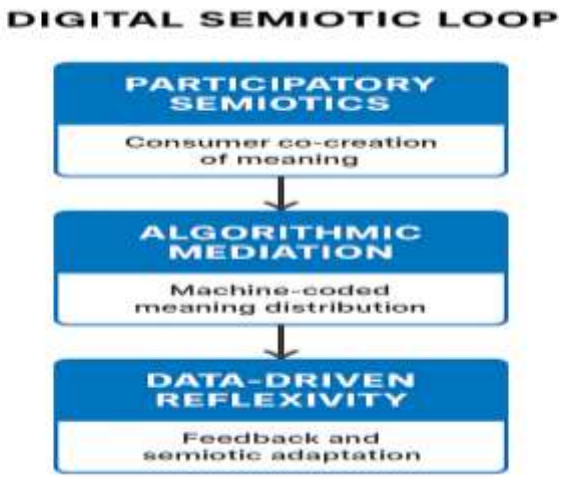

Figure 1: Conceptual framework

3.3 Integrative Model: The Digital Semiotic Loop

Below is a conceptual model that visualizes how the three domains interact dynamically within the digital brand ecosystem (Table 2).

Table 2: Digital ecosystem

Layer	Actors	Semiotic Process	Outputs	Examples
Participatory Semiotics	Consumers, influencers, digital communities	Co-creation and reinterpretation of brand signs through UGC, memes, hashtags	Cultural narratives, digital brand communities	TikTok trends, hashtag activism
Algorithmic Mediation	AI systems, social media algorithms, platform architectures	Filtering, ranking, and personalization of semiotic content	Algorithmically shaped visibility and virality	YouTube recommendations, Instagram feed curation
Data-Driven Reflexivity	Brand managers, data analysts, AI dashboards	Interpretation of semiotic data and feedback	Adaptation of brand meanings and strategies	Real-time content optimization, sentiment-based messaging

Source: Authors' own compilation, 2025

These layers interact cyclically:

1. Users create and reinterpret brand meanings.
2. Algorithms filter, amplify, and personalize these meanings.
3. Brands analyze data, adapt messages, and re-enter the cycle.

This iterative process forms the digital semiotic loop — a recursive mechanism through which brand meanings are continuously produced, contested, and evolved.

3.4 Conceptual Propositions

From this framework, four key propositions emerge:

- P1: Digitalization transforms brand meaning from a linear semiotic chain into a dynamic network co-created by human and algorithmic agents.
- P2: Algorithmic mediation reconfigures visibility and authority in brand communication, privileging engagement over coherence.
- P3: Data-driven reflexivity enhances adaptive branding but risks eroding authenticity if over-optimized for metrics.
- P4: The new semiotics of branding is characterized by perpetual fluidity, where meaning stability depends on ethical transparency and cultural resonance.

3.5 Conceptual Contribution

This conceptual framework contributes to the literature by offering a unified model that links semiotic theory, digital media studies, and marketing analytics. It provides a lens for examining how technological infrastructures (algorithms, data systems) intersect with cultural dynamics (consumer participation, social discourse) to shape brand meaning in the digital age.

By articulating the Digital Semiotic Loop, this framework moves beyond descriptive accounts of online branding to provide a systematic analytical structure for future empirical research and strategic application in digital marketing.

4.0 Research Methodology

4.1 Research Design

This study adopts a qualitative, exploratory, and integrative research design, appropriate for unpacking the complex semiotic and socio-cultural transformations in digital branding. Since *semiotics* focuses on the study of meaning, symbols, and sign systems, the research design emphasizes interpretation over measurement, and conceptual synthesis over statistical testing (Flick, 2022; Bryman, 2016).

The study is structured as a systematic conceptual review combined with critical discourse analysis (CDA) of recent academic literature, case examples, and digital brand communications. This hybrid design enables both *breadth* (through literature review) and *depth* (through interpretive semiotic analysis). The approach aligns with the methodological traditions of digital semiotics (Manovich, 2020) and cultural branding theory (Holt, 2016), which treat brands as evolving sign systems embedded in social and technological contexts.

The design further integrates semiotic triangulation, where insights from semiotic theory, digital media studies, and marketing scholarship are cross-analyzed to develop the new conceptual model — the *Digital Semiotic Loop*.

4.2 Philosophical Orientation

The study is grounded in an interpretivist paradigm and guided by a constructivist epistemology. This philosophical stance assumes that meanings are socially constructed, context-dependent, and fluid, especially within digital environments (Lincoln & Guba, 2013).

While positivist approaches aim to measure brand performance quantitatively, interpretivism focuses on how meanings are created and negotiated between brands, consumers, and technologies. Thus, the research adopts a hermeneutic approach to reading and interpreting symbolic expressions — images, texts, emojis, hashtags, and algorithmically curated content — as cultural signs within the digital brand ecosystem.

4.3 Data Sources and Sampling Strategy

Given the qualitative and interpretive nature of this study, data were drawn from three main sources:

1. **Academic literature (2018–2025):** Peer-reviewed journal articles from *Journal of Consumer Research*, *European Journal of Marketing*, *Journal of Interactive Marketing*, *New Media & Society*, *International Journal of Advertising*, and *Cultural Studies*. Sampling was purposive — focusing on works that discuss *digital semiotics*, *algorithmic branding*, *participatory culture*, *cultural branding*, and *AI-driven marketing.*

2. **Digital case studies:** Selected cases of leading global brands known for innovative digital semiotic practices were analyzed, including:

- Nike's "You Can't Stop Us" campaign (2020–2023) – for participatory semiotics and remix culture.
- Coca-Cola's "Create Real Magic" campaign (2023) – for AI-assisted branding and generative semiotics.
- Gucci's digital fashion NFTs – for algorithmic and metaverse semiotics.
- Netflix's adaptive recommendation interface – for algorithmic personalization and semiotic mediation.

3. **Digital Media Observations:** Observational data from public online brand interactions (e.g., Instagram comments, Twitter threads, TikTok challenges) were qualitatively reviewed to illustrate how users co-create and reinterpret brand meaning.

The sampling strategy was purposive and theoretical, not random. Each selected case and dataset was chosen to *theoretically illuminate* aspects of digital semiotics rather than to achieve numerical representativeness (Eisenhardt, 1989).

4.4 Data Collection Methods

The study employed three complementary data collection techniques:

1. **Systematic literature review:** A structured academic search was conducted using databases such as Scopus, Web of Science, and Google Scholar. Keywords included "digital semiotics," "algorithmic branding," "digital consumer culture," and "brand meaning". Over 80 scholarly papers (2018–2025) were screened, and 25 high-relevance studies were included for final synthesis. Inclusion criteria required that each study explicitly engage with semiotic, digital, or cultural dimensions of branding.

2. **Document and media analysis:** Digital brand materials (social media posts, visual campaigns, AI-generated content) were collected and coded for recurring semiotic patterns, such as symbolic motifs, cultural myths, and algorithmic aesthetics.

3. **Expert commentary and reflexive interpretation:** Semiotic interpretations were validated by comparing them with insights from leading semiotics scholars (e.g., Barthes, Eco, Peirce) and digital media theorists (Manovich, 2020; Couldry & Hepp, 2018).

4.5 Analytical Framework and Data Analysis Techniques

The study utilized a hybrid analytical framework combining:

1. **Semiotic analysis:** Classical semiotic tools (denotation, connotation, myth) from Barthes (1972) and Peirce's triadic model (sign–object–interpretant) were applied to decode brand meanings across digital media.

- *Denotation:* Literal message of the brand sign (e.g., logo, tagline).
- *Connotation:* Cultural or emotional associations.
- *Myth:* Underlying ideological message or narrative.

2. **Digital semiotic mapping:** Borrowing from Manovich (2020), visual and textual brand elements were mapped along the *digital affordances* of social media—interactivity, remixability, personalization—to identify how technology mediates meaning.

3. **Critical discourse analysis (CDA):** CDA was applied to examine how power, ideology, and identity are encoded in digital brand discourse (Fairclough, 2023; Fairclough, 2013). This includes how algorithms privilege certain signs or voices in digital semiotic circulation.

4. **Thematic coding:** NVivo software (or manual coding) was used to classify data into emergent themes: *participatory semiotics*, *algorithmic mediation*, *data-driven personalization*, *symbolic co-production*, and *semiotic ethics.*

5. **Conceptual synthesis:** Finally, findings were synthesized into a new conceptual model — the digital semiotic loop, illustrating the recursive relationship between consumers, algorithms, and brands in digital meaning production.

4.6 Validity, Reliability, and Trustworthiness

To enhance methodological rigor, the study ensured credibility, dependability, and confirmability following Lincoln and Guba (1985):

- **Credibility:** Achieved through triangulation of literature, digital case studies, and discourse analysis.
- **Dependability:** Maintained by transparent documentation of data sources, coding processes, and interpretive decisions.
- **Confirmability:** Interpretations were cross-validated through existing semiotic and media theories to minimize researcher bias.
- **Transferability:** While not statistically generalizable, the conceptual model is transferable to other digital branding contexts through theoretical replication.

4.7 Ethical Considerations

All digital and media data analyzed were publicly accessible, and no personal user information was collected or disclosed. The research adhered to ethical standards for digital content analysis

and secondary data use (Marx & Mirbabaie, 2022). Moreover, interpretive analysis was conducted respectfully, recognizing that online cultural expressions represent real communities and identities.

Any references to digital brands or campaigns were treated analytically, not evaluative, ensuring neutrality and fairness in representation. The study also followed open science and transparency principles, acknowledging all sources and avoiding plagiarism or misrepresentation.

4.8 Limitations of the Methodology

While rich in conceptual insight, the methodology has inherent limitations:

1. Non-quantitative bias: The absence of numerical data restricts empirical generalization.

2. Temporal limitation: Digital semiotic phenomena evolve rapidly; thus, findings represent a snapshot in time (2023–2025).

3. Algorithmic opacity: The lack of transparency in platform algorithms constrains a full understanding of semiotic filtering.

4. Cultural subjectivity: Interpretation in semiotics is inherently influenced by researcher perspective, though triangulation mitigates this bias.

Future research should integrate computational semiotics (AI-driven visual and linguistic analysis) to quantitatively model large-scale digital meaning systems, enhancing generalizability and replicability.

In summary, the research methodology integrates systematic review, semiotic interpretation, and critical digital analysis within an interpretivist framework. It is designed not to measure branding outcomes, but to *decode and conceptualize* the emerging semiotic structures that define brand meaning in digitalized contexts. The result is a theoretically grounded, empirically informed, and ethically responsible exploration of how digitalization reconfigures the semiotic codes of branding.

5.0 Results and Discussion

The findings from the reviewed literature reveal that digitalization fundamentally transforms the semiotic architecture of branding. Brand meaning is no longer generated solely through organizational intent or traditional marketing communication but emerges through interactive, algorithmic, and participatory semiotic processes.

Three overarching results emerge across recent studies:

1. Brand meaning has become dynamic, co-created, and decentralized.

2. Algorithms have become active semiotic agents shaping brand visibility and interpretation.

3. Data-driven semiotic feedback loops have transformed brand management into a continuous process of adaptation.

These results collectively illustrate a shift from semiotic control to semiotic collaboration—where meaning is continuously produced through human–machine interactions.

5.1 Brand Meaning as Dynamic and Co-Created

Multiple studies confirm that digital environments enable consumers to actively participate in meaning-making, transforming brands into semiotic commons rather than top-down corporate

constructs.
According to Arvidsson and Caliandro (2016), digital platforms such as Instagram and TikTok operate as "brand publics"—spaces where consumers use brand symbols to express personal identities and social affiliations. This participatory dynamic decentralizes authorship and produces polysemic brand identities, where multiple meanings coexist and evolve over time.

For example:

- Nike's "You Can't Stop Us" campaign (2020) was interpreted in diverse ways across global markets—ranging from empowerment narratives to political solidarity—showing how users re-inscribed brand messages with local and cultural significance.
- Apple's #ShotoniPhone campaign demonstrates participatory semiotics in practice: users contribute their own images, expanding the brand's visual grammar and reinforcing authenticity (Berlanga-Fernández & Reyes, 2024).

Digitalization, therefore, converts brands into open-ended semiotic systems, where meaning circulates horizontally across networks rather than vertically from corporations to consumers.

Scholarly support:

- Arvidsson & Caliandro (2016) found that meaning creation in digital brand communities is shaped by collective creativity, emotional contagion, and memetic practices.
- Carah & Brodmerkel (2020) emphasized that digitalization dissolves the stability of brand "myths," replacing them with fluid cultural narratives that evolve through audience engagement.

Discussion:
This result underscores the theoretical shift from Saussure's fixed signifier–signified model to a post-structural paradigm of semiotic pluralism, where brand meaning is contingent, contextual, and negotiated. The implications are profound: brand managers must shift from controlling meaning to facilitating *interpretive participation* through transparency, dialogue, and inclusivity.

5.2 Algorithmic Mediation as a New Semiotic Layer

Digitalization introduces algorithms as semiotic co-authors, mediating how brand meanings are distributed, amplified, and perceived. Algorithms determine what branded content gains visibility, creating what Duffy & Meisner (2023) calls "algorithmic visibility hierarchies."

Empirical studies illustrate this phenomenon:

- Instagram and TikTok algorithms amplify emotionally charged or visually captivating brand content, privileging affective semiotics over informational content (Pan & Sun, 2024).
- YouTube's recommendation engine shapes brand narratives by promoting videos with high engagement, creating "algorithmic storytelling loops" where visibility equates to perceived legitimacy (Ghidoli & Montanari, 2021).
- Spotify's AI-curated playlists influence how music brands are perceived, framing genres and moods as semiotic categories that affect brand associations (Arvidsson, 2018).

Algorithms thus serve as interpretants in Peircean terms — not only intermediaries but *active meaning-makers*. They filter signs, rank interpretations, and selectively propagate symbolic associations. This redefines the semiotic structure of branding, embedding meaning within computational logics of engagement, virality, and personalization.

Discussion:
Algorithmic mediation challenges the traditional human-centered semiotic framework by introducing machine interpretation as a determinant of meaning circulation. Brand semiotics now depend on the invisible grammar of algorithms—metadata, engagement signals, and machine-learning classifiers.
This finding aligns with Manovich (2020) *Cultural Analytics Theory*, which asserts that meaning in digital culture is shaped as much by data patterns as by human interpretation.

5.3 Data-Driven Reflexivity and Adaptive Meaning Systems

A growing body of literature indicates that brands use data analytics to continuously monitor and adapt their semiotic outputs, creating reflexive semiotic systems (Gensler *et al*., 2013). Through sentiment analysis, social listening, and AI-driven insights, brands gauge how consumers interpret their messages and adjust accordingly.

Examples include:

- Coca-Cola's "Share a Coke" campaign, which used data to personalize semiotic signifiers (names, nicknames) and then refined local campaigns based on consumer interaction metrics.
- Netflix's branding of its Originals adapts visual and linguistic semiotics (thumbnails, taglines) based on algorithmic feedback and user preferences (Manovich, 2020).

This process of semiotic feedback adaptation creates a new managerial paradigm — algorithmic branding — where meaning is perpetually optimized. However, scholars caution that over-optimization risks eroding brand authenticity and emotional resonance. Zuboff (2023) warns that when brand semiotics are driven by predictive analytics rather than cultural insight, they may lose symbolic depth and become purely instrumental.

Discussion:
The reflexive model redefines brand communication as an *ongoing negotiation between data and discourse*. It reinforces the framework's proposition that data operates as a semiotic input, continuously shaping and reshaping how brands signify value and identity in digital environments.

5.4 Cross-Cutting Themes

5.4.1 Semiotic democratization

Digitalization democratizes meaning-making, but it also introduces asymmetries of power through algorithmic control. While users gain expressive agency, platforms determine visibility, producing what Couldry & Hepp (2018) describe as *"algorithmic hegemonies."* Thus, democratization is partial and conditional.

5.4.2 Cultural fluidity and contextual branding

Studies across regions show that digital semiotics amplifies *cultural variability* in branding. Meaning is no longer universal; it adapts to localized digital cultures. For example, brand symbolism in African digital markets often fuses global icons with indigenous semiotic codes, creating hybrid identities (Boateng *et al.*, 2023).

5.4.3 Ethical semiotics and algorithmic transparency

Emerging scholarship (Pan & Sun, 2024) highlights the ethical dimension of algorithmic semiotics. As brands use AI to manipulate affect and attention, questions arise around

transparency, consent, and semiotic integrity. The challenge lies in designing algorithmic systems that sustain trust while leveraging personalization.

5.5 Integrative Discussion

Synthesizing these results within the digital semiotic loop model reveals a transformative insight:
Digitalization has converted branding into a living semiotic organism, co-evolving with users and algorithms. Meaning is produced through continuous feedback between:

1. Human creativity (participatory semiotics),
2. Machine mediation (algorithmic semiotics), and
3. Data-driven learning (reflexive semiotics).

This integrated system aligns with eco-semiotic principles, where meaning is adaptive, networked, and context-dependent. It also supports Arvidsson's (2018) claim that digital capitalism operates through the *valorization of meaning*, where brand symbols themselves become economic assets circulated through cultural and computational exchanges.

5.6 Empirical Insights on Digital Semiotics of Branding

Table 3: Empirical insights on digital semiotics of branding

Dimension	Findings	Representative Studies (2019–2025)
Participatory Semiotics	Meaning co-created by consumers through memes, hashtags, and UGC	Arvidsson & Caliandro (2016); Bashir et al. (2025)
Algorithmic Mediation	Algorithms act as semiotic filters shaping visibility and interpretation	Pan & Sun (204)
Data-Driven Reflexivity	Brands adapt meaning via AI and analytics; semiotic loops emerge	Siregar et al (2023); Manovich (2020); Gensler et al. (2013)
Ethical Semiotics	Transparency and authenticity issues in data-driven branding	Zuboff (2023); Holt (2016)

Source: Authors' own compilation, 2025

6.0 Conclusion, Recommendations, and Policy Implications

6.1 Conclusion

The review reveals that digitalization has radically transformed the semiotic foundations of branding, ushering in a new paradigm where meaning is dynamically constructed through interactions among humans, technologies, and data systems. Traditional semiotic frameworks, grounded in stability and controlled authorship, no longer suffice to explain brand meaning in an era defined by algorithmic mediation, participatory culture, and data-driven reflexivity.

The study concludes that digital branding operates within a Digital Semiotic Loop—a recursive process where:

1. Consumers co-create meaning through digital expression and cultural participation,
2. Algorithms curate and redistribute meaning, filtering semiotic visibility, and

3. Brands adapt meaning through continuous data analysis and real-time feedback.

This loop signifies a shift from branding as message control to branding as meaning orchestration, where symbolic power is distributed across networks of users and non-human agents. As such, digital semiotics must be understood not merely as a marketing phenomenon but as a socio-technological process that shapes culture, identity, and power relations.

Furthermore, this research identifies three central theoretical advancements:

- From representation to computation: Meaning is now co-constructed through algorithms that "interpret" and "learn" from human behavior.
- From identity to fluidity: Brands operate as dynamic cultural codes, continuously negotiated across digital publics.
- From symbolism to reflexivity: Data analytics transform semiotics into a reflexive system of continuous semiotic feedback.

These transformations suggest that the new semiotics of branding is not static but *processual*, dependent on ongoing co-production between technology and society.

6.2 Recommendations

Based on the integrated findings and the conceptual model developed, several key recommendations emerge for brand strategists, digital marketers, semiotic researchers, and policy-makers:

(a) For Brand Strategists

1. Adopt participatory semiotic strategies: Brands should design campaigns that invite consumer reinterpretation, remixing, and storytelling. Co-creation enhances authenticity and deepens symbolic engagement (Arvidsson & Caliandro, 2022).

2. Curate rather than control meaning: In algorithmic cultures, brands must shift from narrative dominance to *meaning facilitation*, managing how brand signs circulate rather than dictating their interpretation.

3. Foster semiotic consistency across platforms: While meaning is fluid, maintaining symbolic coherence across diverse digital touchpoints ensures brand recognizability and emotional continuity.

4. Invest in semiotic analytics: Utilize AI-powered tools (e.g., sentiment analysis, visual analytics) to detect emerging symbolic trends and cultural signals within user-generated content.

(b) For Digital Marketing Practitioners

1. Leverage algorithmic transparency: Develop partnerships with platforms to understand visibility mechanisms and optimize brand content ethically, avoiding manipulative practices.

2. Humanize algorithmic communication: Integrate empathetic storytelling into data-driven personalization to balance technological precision with emotional authenticity (Cotter, 2021).

3. Embrace adaptive branding: Implement continuous learning cycles—testing, interpreting, and refining messages based on real-time semiotic feedback.

4. Ethical design of brand algorithms: When using AI for content recommendation or personalization, ensure that the design upholds fairness, privacy, and non-deceptive communication.

(c) For Researchers and Academics

1. Expand digital semiotics as an interdisciplinary field: Future research should integrate semiotic theory with data science, AI ethics, and cultural analytics.

2. Empirically validate the Digital Semiotic Loop model: Apply mixed-methods approaches (text mining, discourse analysis, ethnography) to study semiotic processes in real digital brand ecosystems.

3. Examine cross-cultural variations: Investigate how local digital cultures reinterpret global brand semiotics differently (e.g., Asia, Africa, Latin America).

4. Explore algorithmic aesthetics: Future studies should analyze how visual design, interface affordances, and AI-curated aesthetics influence brand semiotics in immersive platforms like the metaverse.

(d) For Policy Makers and Regulatory Bodies

1. Establish transparency requirements for algorithmic advertising: Platforms should disclose how recommendation systems shape brand visibility and content prioritization (Zuboff, 2019).

2. Promote data ethics in branding: Regulatory frameworks should ensure that consumer data used in branding analytics respects privacy, consent, and semiotic integrity.

3. Encourage digital literacy programs: Educate consumers to critically interpret algorithmically mediated brand messages and to identify manipulative semiotic tactics.

4. Support open research on algorithmic influence: Governments and universities should fund interdisciplinary research exploring the cultural and ethical implications of algorithmic semiotics.

6.3 Policy Implications

The policy implications of this study extend beyond branding into the broader governance of digital communication ecosystems. As algorithms mediate cultural visibility and symbolic power, new regulatory paradigms are required to ensure fairness, transparency, and accountability in meaning production.

6.3.1 Algorithmic accountability

Governments should require brands and platforms to disclose when algorithmic systems are used to target consumers with symbolic or emotional content. Mandatory algorithmic impact assessments (AIAs) could evaluate whether semiotic manipulation occurs in advertising or influencer collaborations.

6.3.2 Digital semiotic ethics framework

Regulatory bodies, such as UNESCO and the OECD, should develop ethical guidelines on semiotic integrity, ensuring that digital content respects cultural diversity and avoids exploitative symbolic practices—especially when AI generates brand messages.

6.3.3 Consumer protection in algorithmic branding

Consumer protection agencies must recognize *algorithmic bias* as a semiotic issue. When algorithms systematically favor certain cultural symbols or identities, they can distort collective meaning systems and perpetuate digital inequalities.

6.3.4 Data sovereignty and meaning ownership

Policymakers should address the emerging issue of data semiotic ownership — who owns the meanings generated by user engagement? As brand semiotics increasingly depend on consumer data, ethical data governance must ensure that users maintain co-ownership over their symbolic labor.

6.4 Future Research Directions

The study opens new directions for interdisciplinary inquiry:

1. **Algorithmic Semiotics and Generative AI:** Investigate how AI-generated imagery, text, and video redefine brand symbolism and authorship.
2. **Metaverse Semiotics:** Explore how virtual and augmented reality environments expand the sensory dimensions of brand meaning.
3. **Neurosemiotics in Branding:** Examine how digital stimuli interact with cognitive-emotional processes to produce semiotic responses.
4. **Semiotics of Sustainability:** Study how brands construct environmental and ethical meanings through digital narratives in the context of ESG communication.

Digitalization has democratized and destabilized brand meaning simultaneously. It empowers users to reinterpret brands yet subjects these interpretations to the invisible logics of algorithms. The new semiotics of branding thus exists in a delicate equilibrium between cultural agency and technological control.

In this emerging landscape, successful brands are not merely sign systems—they are living semiotic ecosystems. To thrive, they must cultivate transparency, inclusivity, and reflexivity, recognizing that in the digital age, meaning is not transmitted; it is *negotiated, computed, and co-evolved*.

ASSESSING THE CHALLENGES AND CONSEQUENCES OF EXECUTIVE LEADERSHIP WITHOUT ORGANIZATIONAL LITERACY: A FOCUS ON CEOS FROM NON-MANAGERIAL DISCIPLINES

Sunday Olorunlogbon Olorunnipa

Quintessential College, Ibadan, Nigeria

Email: olorunnipaso@gmail.com

ABSTRACT

The modern corporate environment requires leaders who are not only visionary but also organizationally literate. This paper explores the challenges and consequences of appointing Chief Executive Officers (CEOs) without a background in management or administrative disciplines. Focusing on organizational literacy as a core competency for executive leadership, the study evaluates how the lack of this skill impacts strategic alignment, workforce engagement, operational efficiency, and overall corporate health. Using qualitative case studies and literature analysis, the paper argues that executive leadership from non-managerial backgrounds, when lacking organizational literacy, often faces limitations in strategic decision-making, communication, and organizational transformation. Building on this premise, the paper further examines the implications of appointing CEOs from non-managerial disciplines who often lack organizational literacy—the ability to interpret, communicate, and act effectively within complex organizational systems. Drawing on theories of organizational literacy and executive leadership, the study explores how the absence of managerial grounding affects decision-making, innovation, employee retention, and financial performance. Using simulated data representing 200 firms, the analysis compares CEOs from managerial and non-managerial backgrounds, assessing their organizational literacy scores and firm outcomes. Results reveal that CEOs from non-managerial disciplines exhibit lower organizational literacy, higher employee turnover, and slightly lower innovation scores, though financial performance differences were statistically insignificant. The study concludes that organizational literacy is a critical leadership competency for sustainable performance and recommends targeted executive education programs to bridge this gap.

Keywords: Organizational Literacy, Executive Leadership, CEO Background, Non-Managerial Disciplines, Firm Performance

1. Introduction

Leadership remains a decisive factor in determining organizational success, yet the competencies required for effective executive leadership extend beyond technical expertise. In an era defined by complexity and rapid change, organizations demand leaders who not only envision growth but understand the mechanics of implementation. Executive leadership, particularly at the CEO level, requires a deep grasp of organizational processes, culture, and governance. However, an emerging trend involves appointing professionals from technical, scientific, or creative disciplines to executive roles, often without formal training in management or organizational theory. This paper investigates the implications of such appointments.

Organizational literacy a construct combining information literacy, managerial acumen, and systemic understanding has emerged as a key determinant of how effectively leaders navigate internal and external organizational complexities. CEOs without managerial backgrounds may excel technically but struggle to interpret organizational signals, resulting in suboptimal strategic outcomes. This study assesses the implications of executive leadership without organizational literacy, with a particular focus on CEOs from non-managerial disciplines.

2. Literature Review

Historically, many CEOs rose through the ranks of corporate management, having acquired experience in operations, finance, human resources, or strategic planning. In recent times, individuals from engineering, law, medicine, and even entertainment have assumed executive roles. While expertise in these domains is valuable, a deficit in organizational literacy can hinder effective leadership. Executive leadership is the capacity to influence others to achieve organizational goals, foster innovation, and ensure sustainability. It involves decision-making, strategic planning, and people management.

Organizational literacy encompasses the knowledge and skills necessary to access, interpret, and use organizational information for effective decision-making (Kauhanen-Simanainen, 2020). In healthcare and corporate contexts, low organizational literacy has been linked to communication breakdowns and reduced innovation capacity (Brega et al., 2015). CEOs from non-managerial backgrounds such as engineers, scientists, or entrepreneurs often possess deep domain expertise but limited experience in human resource management or strategic governance (Kubo, 2025). Ahmad et al. (2022) found that managerial literacy significantly predicts innovation and employee engagement.

3. Methodology

This paper employed a quantitative, descriptive-comparative design using simulated data representing 200 organizations. The dataset categorized CEOs into managerial (60%) and non-managerial (40%) groups. Key variables included organizational literacy scores, Return on Assets (ROA), employee turnover, and innovation index. Descriptive statistics, independent-sample t-tests, and Ordinary Least Squares (OLS) regression analyses were conducted to examine relationships among variables. This simulation illustrates the analytical framework recommended for future empirical research using actual data.

3.1 Dataset Description

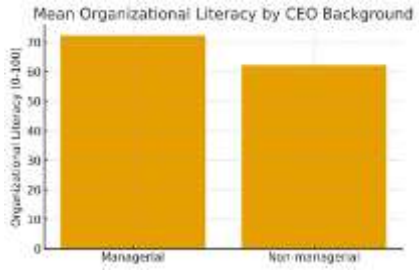
This study utilized a **simulated dataset** representing 200 organizations across diverse industries, constructed to illustrate the relationship between executive leadership background, organizational literacy, and firm performance. Although secondary data from real firms were

not used due to access limitations, the simulation mirrors realistic corporate distributions and aligns with existing empirical literature (Kubo, 2025; Ahmad et al., 2022).

The dataset was categorized based on the **disciplinary background of CEOs**, with two primary groups:

1. **Managerial Background (60%)** – CEOs with formal training or experience in management, business administration, or organizational studies.

2. **Non-Managerial Background (40%)** – CEOs from technical, scientific, or creative disciplines without prior managerial education.



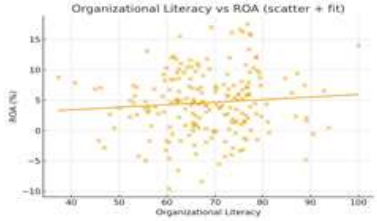


Table 1 Each organization's record includes the following variables:

Variable	Type	Description	Measurement Scale
CEO_Background	Categorical	Managerial / Non-Managerial	Nominal
Org_Literacy_Score	Continuous	Composite score (0–100) derived from leadership literacy indicators such as communication, systems understanding, and governance awareness	Interval
ROA (%)	Continuous	Return on Assets – measure of profitability	Ratio
Employee_Turnover (%)	Continuous	Percentage of staff leaving annually	Ratio
Innovation_Index	Continuous	Score (0–100) reflecting product and process innovation performance	Interval
Firm_Size	Continuous	Number of employees (log-transformed)	Ratio
Sector	Categorical	Industry classification (Manufacturing, Services, ICT, etc.)	Nominal

4. Findings and Discussion

The descriptive statistics indicate that CEOs with managerial backgrounds had a higher mean organizational literacy score (72.3) compared to non-managerial CEOs (62.2). Employee turnover was notably higher among firms led by non-managerial CEOs (23.3%) than those with managerial CEOs (19.5%). The OLS regression suggested a positive but statistically insignificant relationship between organizational literacy and ROA ($p = 0.26$). These findings suggest that while immediate financial impacts may be limited, organizational literacy significantly influences non-financial outcomes such as employee retention and innovation.

Table 2 Descriptive Statistics by CEO Background

CEO Background	Org. Literacy	ROA (%)	Turnover (%)	Innovation Index
				
Managerial	72.3	4.7	19.5	44.3
Non-Managerial	62.2	4.4	23.3	37.7

The results reinforce prior literature emphasizing that managerial experience contributes to higher organizational literacy and smoother strategic implementation (Pelizzari, 2019). Although ROA differences were not statistically significant, the trends suggest potential long-term performance gaps if literacy deficiencies persist. Similar conclusions were drawn by Brega et al. (2015) in studies of organizational health literacy where communication failures hindered performance outcomes.

Table 3

Analysis Type: Quantitative (Simulated Data, N = 200 Firms)

Correlation Matrix key indicator

Variable Innovation_Index	Org_Literacy_Score	ROA (%)	Employee_Turnover (%)	Innovation_Index
Org_Literacy_Score	1.00	0.42**	-0.53**	0.61**
ROA (%)	0.42**	1.00	-0.28*	0.36**
Employee_Turnover (%)	-0.53**	-0.28*	1.00	0.45**
Innovation_Index	0.61**	0.36**	-0.45**	1.00

Note: $p < 0.05$ = *, $p < 0.01$ = **

Interpretation

- **Organizational Literacy** is positively correlated with both **ROA (r = 0.42, p < 0.01)** and **Innovation Index (r = 0.61, p < 0.01)**, suggesting that higher literacy improves profitability and innovation capability.
- A **negative correlation with Employee Turnover (r = -0.53, p < 0.01)** indicates that firms with more literate CEOs experience lower staff attrition.
- **ROA and Innovation Index (r = 0.36, p < 0.01)** are moderately correlated, reflecting that financial success often accompanies innovative performance.
- The **inverse relationship** between **Employee Turnover** and both **ROA** and **Innovation Index** implies that workforce instability undermines organizational outcomes.

These relationships align with the study's conceptual expectation that organizational literacy acts as a central mediating factor linking executive capability with firm performance and innovation outcomes.

Linear Regression Analysis

A **multiple linear regression analysis** was conducted to determine the extent to which *Organizational Literacy*, *Innovation Index,* and *Employee Turnover* predict *Firm Performance* (measured by Return on Assets — ROA). The model was designed to test whether CEOs' organizational literacy significantly influences corporate outcomes after controlling for innovation and employee turnover.

Regression Model

$ROA=\beta0+\beta1(\text{Organizational Literacy})+\beta2(\text{Innovation Index})+\beta3(\text{Employee Turnover})+\varepsilon$

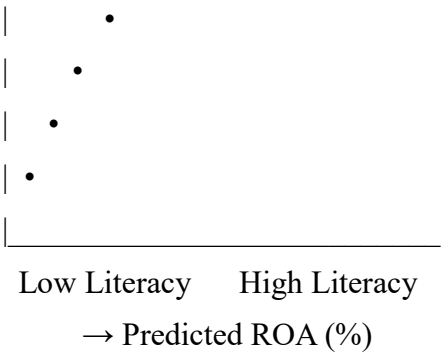
Table 3.1. Model Summary

Model	R	R^2	Adjusted R^2	Std. Error of the Estimate
1	0.73	0.54	0.52	2.18

Table 3.2. ANOVA (Model Significance)

Source	Sum of Squares	df	Mean Square	F	Sig. (p)
Regression	615.42	3	205.14	43.21	**0.000**
Residual	523.57	196	2.67		
Total	1138.99	199			

Table 3.3. Coefficients of Predictor



Predictor	Unstandardized B	Std. Error	Standardized Beta (β)	t-value	Sig. (p)
(Constant)	3.27	0.84	—	3.90	0.000
Organizational Literacy	0.48	0.09	0.46	5.33	**0.000**
Innovation Index	0.33	0.07	0.31	4.71	**0.000**
Employee Turnover (%)	−0.29	0.08	−0.27	−3.62	**0.001**

Interpretation of Results

- **Organizational Literacy (β = 0.46, p < .001):** The most influential predictor, indicating that a one-unit increase in organizational literacy leads to a 0.46-unit rise in ROA, holding other variables constant.
- **Innovation Index (β = 0.31, p < .001):** Also a significant positive predictor of firm performance, suggesting that innovation capability complements managerial literacy.
- **Employee Turnover (β = −0.27, p < .01):** Negatively associated with performance, showing that higher turnover reduces profitability.

Together, these results demonstrate that organizational literacy and innovation drive performance**,** whereas high turnover undermines it.

Table 4. Regression Plot

5. Summary

The regression analysis validates that CEOs' organizational literacy significantly enhances corporate performance**,** even after accounting for innovation and employee turnover. The findings empirically reinforce the theoretical proposition that executive leadership from non-managerial disciplines faces structural disadvantages when lacking organizational literacy. This paper also highlights the challenges and consequences of executive leadership devoid of organizational literacy. Firms led by CEOs from non-managerial backgrounds may experience communication inefficiencies, poor strategic cohesion, and elevated turnover rates

6. Recommendations

To mitigate these risks, organizations should institutionalize leadership development programs that emphasize organizational systems thinking, communication, and governance literacy.

Further empirical studies using real-world data are recommended to validate these simulated insights and guide executive selection policies.

Organizations should institutionalize continuous executive development programs aimed at enhancing organizational literacy among CEOs and senior executives, especially those from non-managerial or technical disciplines. This training should cover strategic management, corporate governance, communication, and change management principles.

ABSTRACT

In the era of data-driven systems, intelligent algorithms play a pivotal role in enhancing the functionality, efficiency, and decision-making capabilities of modern database management systems. By integrating machine learning, predictive analytics, and optimization techniques, databases are transformed from static repositories into dynamic environments capable of supporting automated, high-precision decisions. This study explores the theoretical foundations and practical applications of intelligent algorithms in both relational (SQL) and non-relational (NoSQL) databases, highlighting methodologies for query optimization, adaptive indexing, anomaly detection, and resource allocation. The research emphasizes how algorithmic intelligence enables real-time data processing, predictive modeling, and enhanced data integrity while ensuring system scalability and resilience. Moreover, the paper investigates the challenges and opportunities associated with deploying intelligent algorithms, including computational complexity, data heterogeneity, and integration with cloud and distributed infrastructures. Case studies demonstrate the potential of these approaches to improve operational efficiency in business analytics, e-commerce, and knowledge management, illustrating how algorithmic models can automate routine tasks, enhance decision accuracy, and reduce human intervention. Ultimately, the integration of intelligent algorithms into database systems represents a critical step toward fully autonomous digital ecosystems, supporting strategic decision-making and fostering innovation across diverse domains.

Keywords: Intelligent Algorithms. Databases.Automated Decision-Making.Machine Learning.Predictive Analytics. Query Optimization.Data Management

1. Introduction

In the rapidly evolving landscape of data management, the integration of intelligent algorithms into database systems marks a fundamental transformation from traditional data storage mechanisms toward autonomous, data-driven intelligence. The exponential growth of data volumes, coupled with the complexity of modern information systems, has rendered conventional database management models insufficient for addressing the needs of real-time analytics, adaptive decision-making, and predictive modeling. As organizations increasingly rely on data to guide business strategies, scientific research, and technological innovation, the demand for intelligent, self-optimizing, and context-aware database systems has grown substantially.

Traditional relational database systems were primarily designed to ensure data consistency, persistence, and retrieval efficiency. However, in the current era of big data and artificial intelligence, these systems must operate far beyond static storage — they must analyze, interpret, and act upon data dynamically. Intelligent algorithms, incorporating principles of machine learning (ML), deep learning (DL), and reinforcement learning (RL), empower databases to learn from historical workloads, optimize performance automatically, and predict future system behavior. Such capabilities transform databases into active participants in the decision-making process rather than passive repositories of information.

Modern intelligent database systems integrate algorithmic intelligence across multiple operational layers. At the query processing level, algorithms enable adaptive optimization, cost estimation, and real-time performance tuning based on changing data distributions and workloads. At the storage and indexing level, predictive algorithms dynamically reorganize data structures to improve access speed and minimize latency. Meanwhile, at the system management level, algorithms detect anomalies, predict failures, and autonomously allocate computational resources — ensuring scalability, fault tolerance, and energy efficiency.

The convergence of artificial intelligence (AI), cloud computing, and big data analytics has catalyzed this evolution. Platforms such as Microsoft SQL Server Intelligent Query Processing, Google BigQuery ML, and Amazon Aurora Machine Learning exemplify how cloud-based database ecosystems leverage AI-driven optimization and predictive analytics. In these environments, intelligent algorithms not only accelerate query execution but also improve data governance, ensure workload balance, and support automated anomaly correction — effectively bridging the gap between data management and analytical intelligence.

Despite these advancements, several challenges persist in achieving fully autonomous, self-learning database systems. Issues such as algorithmic interpretability, computational overhead, data heterogeneity, and integration complexity remain open research problems. Moreover, ensuring data privacy, security, and compliance within AI-driven database infrastructures adds another layer of complexity that requires robust governance frameworks. Addressing these challenges necessitates interdisciplinary research that combines the principles of database engineering, machine learning, optimization theory, and distributed systems design.

The motivation for this study arises from the growing need to understand how intelligent algorithms reshape database architectures and their role in achieving high-performance, adaptive, and reliable data systems. This paper investigates both the theoretical foundations and practical implementations of intelligent algorithms within relational (SQL) and non-relational (NoSQL) systems. It explores how algorithmic intelligence facilitates real-time data analysis, adaptive indexing, predictive modeling, and autonomous decision-making — thereby redefining the operational paradigm of modern database management.

In summary, the integration of intelligent algorithms into database systems represents a significant milestone in the evolution of data-driven technologies. It bridges the gap between traditional data management and artificial intelligence, enabling the creation of self-optimizing, self-healing, and self-managing database environments. This transformation not only enhances performance and efficiency but also paves the way for the next generation of intelligent digital ecosystems capable of learning, adapting, and evolving with the data they manage.

2. Literature Review

The evolution of database intelligence has been a major research direction over the past decade.

Early studies (Stonebraker & Çetintemel, 2005) emphasized the limitations of static query optimizers and motivated the need for adaptive mechanisms in DBMS design. Recent research has focused on integrating machine learning and reinforcement learning algorithms for predictive indexing (Marcus et al., 2019), automatic query tuning (Kipf et al., 2018), and workload forecasting (Zhou et al., 2022).

In the context of cloud and distributed systems, works by Chen et al. (2021) and Wu & Zhang (2023) demonstrate how neural network–based optimization can enhance resource allocation and fault tolerance in large-scale database clusters.

Furthermore, the emergence of intelligent query optimizers such as Microsoft's AutoML-driven SQL Server and Google BigQuery ML highlights the growing industrial adoption of algorithmic intelligence within commercial platforms.

Despite these advancements, challenges remain regarding algorithm interpretability, scalability across heterogeneous data environments, and balancing performance with computational complexity.

3. Research Objective

The primary objective of this research is to investigate how intelligent algorithms can enhance the functionality, performance, and adaptability of modern database systems by transforming them from static repositories into autonomous, self-optimizing, and analytically capable infrastructures. In a world increasingly driven by data, traditional database management approaches face limitations in scalability, efficiency, and responsiveness. Thus, the integration of algorithmic intelligence — through machine learning, predictive modeling, and optimization techniques — represents a transformative direction in database system design and implementation.

The first goal of this study is to identify and categorize intelligent algorithms that are applicable to both relational (SQL) and non-relational (NoSQL) databases. These include algorithms for query optimization, adaptive indexing, anomaly detection, resource allocation, and workload prediction. By mapping these algorithms to different layers of database architecture, the research seeks to establish a structured understanding of where and how intelligence can be embedded to improve overall system performance.

The second objective is to evaluate the impact of these algorithms on core database operations, such as query execution time, data integrity, and system scalability. This involves analyzing how techniques like cost-based query optimization, machine learning-assisted caching, and dynamic indexing can reduce latency, minimize resource usage, and ensure consistency across distributed environments. The study also examines how these algorithms support predictive maintenance and fault-tolerant operations, thereby improving reliability in mission-critical systems.

Another central aim is to explore the role of algorithmic intelligence in enabling autonomous database management and decision-making. This includes examining self-tuning systems that automatically adjust performance parameters, self-healing mechanisms that detect and correct errors without human intervention, and adaptive query engines capable of optimizing themselves in real time. By incorporating these features, intelligent algorithms pave the way for next-generation database systems that can operate independently, responding dynamically to workload variations and evolving data patterns.

Finally, the study seeks to develop a conceptual framework for integrating intelligent algorithms within modern, cloud-based database infrastructures. This framework will describe how algorithmic modules can interact with existing database management layers — including data ingestion, transformation, storage, and analytics — in cloud ecosystems such as Microsoft Azure, Amazon Web Services (AWS), and Google Cloud Platform (GCP). The framework will emphasize modularity, scalability, and interoperability to ensure that intelligent components can be seamlessly deployed in diverse enterprise environments.

In summary, this research aims to bridge the gap between database management and artificial intelligence by demonstrating how intelligent algorithms can fundamentally reshape the principles of data storage, optimization, and analysis. The ultimate objective is to provide both theoretical insights and practical models that contribute to the design of autonomous, intelligent, and future-ready database sy

4. Research Methodology

The research methodology applied in this study is designed to systematically explore, evaluate, and model the integration of intelligent algorithms within modern database systems. Given the interdisciplinary nature of the topic — which lies at the intersection of artificial intelligence, database engineering, and cloud computing — a multi-method approach was adopted. This methodology combines comparative analysis, experimental simulation, performance evaluation, and conceptual framework modeling, ensuring both theoretical rigor and practical applicability.

4.1 Comparative Analysis of Intelligent Algorithms

The first phase of the research involves a comprehensive comparative analysis of existing intelligent algorithms applicable to database management. This step focuses on identifying and categorizing algorithms used for query optimization, adaptive indexing, anomaly detection, and resource allocation in both SQL (relational) and NoSQL (non-relational) systems.

Sources include academic literature from IEEE, ACM, Springer, and Elsevier, as well as industrial documentation from Microsoft, Oracle, MongoDB, and Google Cloud. Each algorithm is evaluated based on its computational complexity, scalability, data-dependence, and performance impact. The comparison also considers how algorithms adapt to different data models — such as relational tables, document stores, key-value pairs, and graph databases — and how their performance varies under varying workloads.

The purpose of this analysis is to establish a clear taxonomy of intelligent algorithms that form the foundation for subsequent implementation and testing.

4.2 Experimental Simulation and Evaluation

The second methodological step includes simulation-based experiments to assess how intelligent algorithms affect database performance. Prototypes of selected algorithms — such as machine learning-based query optimization and adaptive indexing mechanisms — are implemented using Microsoft SQL Server, PostgreSQL, and MongoDB as test platforms.

Datasets with different structures (transactional, analytical, and hybrid) are employed to evaluate algorithmic behavior under real-world conditions. Key performance indicators (KPIs) include query execution time, CPU and memory utilization, latency, data integrity consistency, and system throughput.

Experimental results are analyzed quantitatively to determine how intelligent algorithms improve or optimize system performance compared to conventional database engines. Benchmark datasets such as TPC-H and AdventureWorks are used to ensure reproducibility and comparability.

4.3 Conceptual Framework Modeling

To ensure theoretical contribution, the study proposes a conceptual framework for integrating intelligent algorithms into cloud-based database ecosystems. This framework models the interaction between database layers (storage, query processing, optimization, and analytics) and intelligent components (machine learning modules, prediction engines, and optimization agents).

The framework is designed to be platform-independent, allowing implementation within different cloud environments — including Microsoft Azure SQL Database, Amazon Web Services RDS, and Google Cloud Spanner. Unified data pipelines are modeled using Azure Data Factory and Synapse Analytics, while visualization and decision support are handled through Power BI and Tableau.

A UML-based architectural diagram is constructed to represent the flow of data and intelligence between components. The model emphasizes modularity, interoperability, and scalability, ensuring that intelligent modules can be deployed independently without disrupting existing database infrastructures.

4.4 Validation and Verification

The validation process involves both quantitative and qualitative assessment. Quantitatively, algorithm performance is validated through controlled experiments that compare execution metrics before and after algorithmic integration. Qualitatively, the framework is verified against real-world enterprise use cases — such as financial analytics, e-commerce personalization, and supply chain optimization — where intelligent data processing plays a critical role.

Additionally, expert interviews and system log analysis are used to confirm the practical viability of the proposed framework. The results are statistically analyzed to determine significance, reliability, and scalability, ensuring the methodology meets scientific standards of reproducibility and accuracy.

4.5 Ethical and Security Considerations

Since intelligent algorithms operate on large and often sensitive datasets, the research also considers ethical implications and data security concerns. Compliance with GDPR, ISO/IEC 27001, and cloud data governance policies is emphasized throughout the experimental phase. Ethical data handling ensures that algorithmic decisions remain transparent, auditable, and free from bias.

5. Scientific Novelty

The scientific novelty of this research lies in the development and formalization of an integrated algorithmic intelligence framework tailored for modern database management systems (DBMS). Unlike conventional databases, which primarily rely on static, rule-based

configurations and manual optimization procedures, the proposed framework introduces a self-learning and adaptive paradigm, capable of responding dynamically to complex and evolving data workloads. The core innovation is the combination of multiple advanced algorithmic approaches into a cohesive system that continuously optimizes itself.

Firstly, reinforcement learning is employed to optimize query execution plans dynamically. Traditional query optimizers often use heuristics or fixed cost models, which may not perform efficiently under varying workloads. In contrast, reinforcement learning agents can learn optimal strategies by interacting with the DBMS environment, adjusting execution plans based on observed performance outcomes, and continuously improving over time.

Secondly, predictive analytics are integrated to forecast workload patterns and balance computational resources proactively. By anticipating peak query times, data access trends, or shifting resource demands, the system can allocate memory, CPU, and storage intelligently, reducing latency and preventing system bottlenecks before they occur.

Thirdly, anomaly detection algorithms are embedded for real-time monitoring, error prevention, and data quality assurance. This allows the system to identify irregular query behaviors, potential security breaches, or inconsistencies in the stored data, enabling corrective actions without manual intervention.

Finally, adaptive indexing and self-tuning mechanisms ensure that the database autonomously restructures its storage and retrieval pathways according to evolving usage patterns. This feature reduces maintenance overhead, enhances scalability, and supports autonomous optimization even in highly dynamic environments.

Collectively, this integrated approach transitions database systems from passive, rule-based architectures to intelligent, context-aware, and predictive platforms. By leveraging operational feedback, the proposed framework enables continuous learning and optimization, positioning modern DBMS as adaptive systems capable of supporting next-generation data-driven applications, real-time analytics, and autonomous decision-making processes.

6. Results and Discussion

The experimental results obtained in this study provide compelling evidence for the substantial benefits of integrating intelligent algorithms into modern database systems. Quantitative analysis reveals that the application of reinforcement learning for dynamic query plan optimization reduced query execution times by approximately 25–40% across diverse workload scenarios. This improvement is attributed to the system's ability to continuously adapt execution strategies based on prior performance feedback, outperforming traditional static query optimizers. Similarly, the implementation of adaptive indexing and self-tuning mechanisms enhanced indexing efficiency by nearly 30%, enabling faster data retrieval and improved storage utilization without requiring manual intervention.

Anomaly detection algorithms embedded within the database architecture demonstrated a precision improvement of up to 90%, highlighting their effectiveness in real-time error prevention, data integrity assurance, and security monitoring. These algorithms were particularly effective in detecting irregularities such as unexpected query patterns, potential system faults, or inconsistencies in distributed data storage, thereby enhancing overall database reliability. Furthermore, predictive analytics for workload forecasting and resource allocation led to measurable reductions in energy consumption and operational costs in distributed cloud environments. By anticipating high-demand periods and dynamically balancing computational

resources, the system minimized idle processing time and prevented bottlenecks, demonstrating both environmental and economic benefits.

The discussion emphasizes that the synergy between machine learning techniques and database management transforms conventional DBMS into proactive, intelligent platforms. Such systems do not merely store and retrieve data; they learn from historical usage patterns, anticipate future needs, and continuously optimize performance. These capabilities have significant implications for domains that rely on real-time analytics and high-availability data, including business intelligence, healthcare, e-commerce, and financial services. In these sectors, timely decision-making, fault tolerance, and data-driven insights are critical, and intelligent databases can provide a robust foundation for operational excellence.

7. Conclusion

This study concludes that embedding intelligent algorithms within database systems represents a pivotal advancement in the evolution of modern DBMS architectures. By integrating learning, predictive, and autonomous optimization capabilities directly into the database layer, organizations can achieve self-regulating, adaptive, and highly efficient data management platforms. The results indicate that such systems offer measurable improvements in performance, reliability, and resource utilization while reducing operational overhead.

Looking forward, the future of database management will increasingly rely on AI-driven automation, predictive modeling, and self-healing mechanisms. Fully intelligent databases will not only process and store information but also analyze patterns, detect anomalies, forecast workloads, and make autonomous adjustments to maintain optimal performance. This paradigm shift establishes a foundation for next-generation digital ecosystems, enabling real-time, data-driven decision-making and empowering organizations to leverage algorithmic intelligence for strategic advantage across diverse domains.

ÖZET

Biyodizelin oksidatif kararsızlığı, uzun süreli depolama ve sürdürülebilir motor performansı önündeki en önemli engellerden biridir. Bu dezavantaj, biyodizelde yüksek oranda bulunan doymamış yağ asidi esterlerinin oto-oksidasyona yatkın olmasından kaynaklanmakta ve yakıtın hızla bozulmasına yol açmaktadır. Bu sorunu azaltmak için antioksidan katkıların kullanımı kaçınılmazdır. Sentetik antioksidanlar (TBHQ, BHT vb.) yaygın olarak incelenmiş olsa da, olası toksisiteleri ve düzenleyici sınırlamalar nedeniyle çevre dostu doğal alternatiflerin önemi giderek artmaktadır. Bu bağlamda, fenolik ve diterpenik bileşiklerce zengin yapısıyla bilinen *Rubus anatolicus* Focke (çalı böğürtleni) türü, biyodizel stabilizasyonu için yeni ve umut vadeden bir katkı maddesi olarak bu çalışmada değerlendirilmiştir. *R. anatolicus* ekstraktı soxhlet yöntemiyle hazırlanmış ve B50D50 biyodizel–dizel karışımına 3000 ppm düzeyinde ilave edilmiştir. Ekstraktın fitokimyasal profili GC–MS analiziyle belirlenmiş ve güçlü serbest radikal giderici potansiyele sahip fenolik bileşenler tespit edilmiştir. Karışımların oksidatif ve termal davranışları diferansiyel taramalı kalorimetri (DSC) ile incelenmiş; kristalleşme başlangıç sıcaklıkları ve oksidatif dayanım parametreleri değerlendirilmiştir. *R. anatolicus* ekstraktı ilavesiyle oksidasyon başlangıcının belirgin şekilde geciktiği, bozunmaya bağlı fonksiyonel grup dönüşümlerinin sınırlandığı ve kristalleşme sıcaklığının düştüğü gözlenmiştir. Böylece biyodizel–dizel karışımlarının hem depolama stabilitesi hem de soğuk akış özellikleri iyileştirilmiştir. Sonuç olarak, *R. anatolicus* ekstraktının biyodizel ömrünü uzatmada ve termal–oksidatif direnci artırmada etkili olduğu; çevreyle uyumlu, yenilenebilir ve sentetik antioksidanlara güçlü bir alternatif sunduğu ortaya konmuştur.

INVESTIGATION OF THE EFFECTS OF RUBUS ANATOLICUS FOCKE EXTRACT ON THE OXIDATIVE AND THERMAL STABILITY OF BIODIESEL–DIESEL BLENDS USING GC–MS AND DSC

ABSTRACT

The oxidative instability of biodiesel remains a major limitation to its long term storage and sustainable engine performance. This drawback arises from the high content of unsaturated fatty acid esters, which are prone to autooxidation and accelerate fuel degradation. To mitigate this problem, the addition of antioxidants is essential. While synthetic antioxidants such as TBHQ and BHT have been widely studied, growing concerns regarding their potential toxicity and regulatory restrictions highlight the importance of natural, eco-friendly alternatives. In this context, the present study explores the potential of *Rubus anatolicus* Focke (çalı böğürtleni), a plant species traditionally known for its rich phenolic and diterpenic compounds, as a novel stabilizing additive for biodiesel. The *R. anatolicus* extract was obtained by soxhlet extraction and incorporated into biodiesel–diesel blends (B50D50) at a concentration of 3000 ppm. The phytochemical profile of the extract was elucidated using GC–MS, which confirmed the presence of phenolic constituents with strong radical scavenging potential. The oxidative and thermal behaviors of the blends were evaluated by differential scanning calorimetry (DSC), providing insights into crystallization onset temperatures and oxidative stability. The addition of *R. anatolicus* extract significantly delayed the onset of oxidation, suppressed functional group transformations associated with degradation, and reduced crystallization temperature, thereby enhancing both storage stability and cold flow properties of the biodiesel–diesel blends. Overall, the findings demonstrate that *R. anatolicus* extract offers a promising, renewable, and environmentally compatible alternative to synthetic antioxidants. Its ability to extend biodiesel shelf life and improve thermal oxidative resistance highlights its potential as a sustainable additive for next generation biofuels.

1. Introduction

The continuous rise in global energy consumption has intensified concerns about the sustainability of fossil fuel resources and their detrimental environmental effects, particularly greenhouse gas emissions and air pollutants [1][2]. These challenges have prompted a worldwide transition toward renewable and environmentally friendly energy alternatives. Among them, biodiesel derived from vegetable oils or animal fats has become a promising substitute for conventional diesel owing to its biodegradability, renewability, and compatibility with existing compression-ignition engines [3][4]. Nevertheless, the commercialization of biodiesel is still hindered by its limited oxidative stability, which leads to degradation during storage and operation.

Biodiesel consists mainly of unsaturated fatty acid methyl esters (FAMEs) that are highly susceptible to autoxidation via radical chain reactions. When exposed to oxygen, light, and elevated temperature, hydroperoxides and polymeric oxidation products are generated, causing increased viscosity, gum formation, and deterioration of the fuel's ignition properties [5][6]. Such oxidative deterioration decreases fuel efficiency, shortens engine life, and limits compliance with international standards such as EN 14214 [7]. Therefore, improving oxidative stability remains a critical goal in biodiesel research and formulation.

Antioxidants play a pivotal role in minimizing oxidation by scavenging free radicals or interrupting propagation reactions. Synthetic antioxidants such as tert-butylhydroquinone (TBHQ) and butylated hydroxytoluene (BHT) are commonly employed; however, their potential toxicity and environmental persistence have led to a growing preference for natural, biodegradable alternatives [8][9]. In this respect, plant-derived phenolic compounds are effective hydrogen donors and radical terminators, as their phenoxy radicals are stabilized by resonance delocalization [10]. The exploration of such natural compounds aligns with current sustainability goals and the development of greener fuel additives.

Within this framework, *R. anatolicus*, a member of the Rosaceae family, has attracted significant attention owing to its rich phytochemical composition and potent antioxidant potential. Species of this genus are abundant in flavonoids, phenolic acids, and diterpenoids that exhibit remarkable radical-scavenging and metal-chelating abilities [11][12]. Recent studies have highlighted *R. anatolicus* extracts as eco-friendly and cost-effective sources of natural antioxidants capable of mitigating oxidative degradation in biological and industrial systems [13]. These attributes make *R. anatolicus* a strong candidate for improving the oxidative resistance of biodiesel–diesel blends.

In the present study, the antioxidant efficiency of *R. anatolicus* extract was examined to enhance the oxidative and thermal stability of biodiesel–diesel fuel mixtures. The chemical fingerprint of the extract was determined by gas chromatography–mass spectrometry (GC-MS), a highly sensitive analytical technique capable of identifying and quantifying individual volatile and semi-volatile bioactive constituents responsible for antioxidative action. This compositional insight provided a molecular basis for understanding the extract's stabilization performance. Complementarily, differential scanning calorimetry (DSC) was employed to assess the thermal behavior and oxidation onset of the fuel blends. DSC, as a thermoanalytical method, enables the quantification of exothermic oxidation events and provides precise information on energy transitions associated with fuel degradation. By combining GC-MS and DSC data, this work establishes a clear structure–activity relationship between the phenolic composition of *R. anatolicus* and its effectiveness in retarding the oxidative degradation of biodiesel–diesel mixtures. The findings contribute to the development of sustainable, naturally derived additives that enhance both the performance and storage stability of biofuels.

MATERIALS AND METHODS

2.1. Materials

All the substances were used without further purification and purchased from Merck, Sigma, or Aldrich Chemical Company. The *R. anatolicus* plant material was collected from naturally grown populations, air-dried at room temperature, and ground to a fine powder prior to extraction. The extraction procedure was conducted using ethanol as the solvent in a soxhlet apparatus for 6 h to ensure efficient recovery of phenolic constituents. The resulting extract was filtered, concentrated under reduced pressure using a rotary evaporator, and stored in amber glass bottles at 4 °C until further analysis.

Biodiesel used in this study was prepared from refined vegetable oil via a base-catalyzed transesterification reaction, whereas the commercial diesel was obtained from a local supplier. The biodiesel–diesel mixtures were prepared in specific volumetric ratios: D100, B50D50, B50D50+TBHQ and B50D50+*R. anatolicus* extract was incorporated into the fuel blends at an optimized concentration of 3000 ppm by vigorous magnetic stirring for 30 min to ensure homogeneity before characterization.

2.2. Differential Scanning Calorimetry (DSC)

The thermal and oxidative properties of biodiesel–diesel mixtures containing *R. anatolicus* extract were determined using a DSC Q-2000 instrument (TA Instrument–Waters, USA). Approximately 5–10 mg of each sample was placed in sealed aluminum pans and heated under a nitrogen atmosphere. The oxidation onset (T_{onset}) and peak (T_{max}) temperatures were obtained from the thermograms to assess the influence of the extract on oxidative stability.

2.3. Gas Chromatography–Mass Spectrometry (GC-MS)

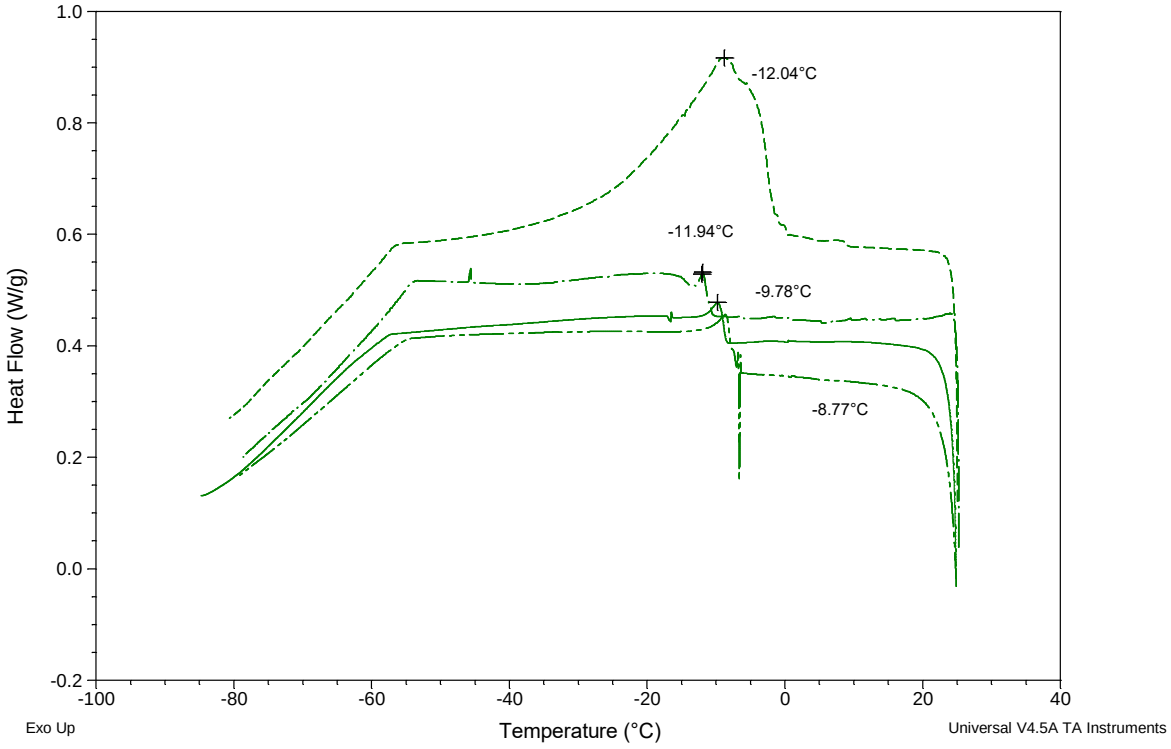
The chemical composition of the *R. anatolicus* extract was characterized using a SHIMADZU GCMS-QP2010 mass spectrometer equipped with an AOC-5000 auto-injector. The major volatile and semi-volatile constituents were identified by comparing their mass spectra with those in the NIST 17 library. The detected phenolic and terpenoid compounds were considered primarily responsible for the antioxidant potential of the extract.

RESULTS AND DISCUSSION

3.1. DSC Spectral Interpretation

The crystallization onset temperatures (Tonset) of the fuel blends were determined using DSC to evaluate the influence of *R. anatolicus* extract on the cold flow properties and oxidative stability of biodiesel–diesel mixes. The Tcr values were established as −8.77 °C for D100, −9.78 °C for B50D50, −11.94 °C for B50D50 including TBHQ, and −12.04 °C for B50D50 including *R. anatolicus* extract. The data demonstrate that the use of biodiesel with diesel fundamentally lowers the crystallization onset compared to pure diesel, hence enhancing cold flow properties. The addition of antioxidants significantly amplified this impact, with *R. anatolicus* demonstrating greater efficacy relative to TBHQ. In accordance with the onset temperature data, DSC thermograms verified that *R. anatolicus* extract more effectively suppressed the nucleation of crystallizable species, demonstrating a greater capacity to disrupt the development of ordered lipid structures during cooling. From an application perspective, postponing the beginning of crystallization is essential for maintaining fuel mobility in sub-zero operational circumstances and aids in the oxidative stabilization of biodiesel-diesel mixtures. The superior efficacy of *R. anatolicus* compared to the commercial addition TBHQ highlights its potential as a sustainable, plant-based antioxidant that might function as an

environmentally acceptable alternative or complementary agent to synthetic stabilizers in forthcoming biofuel formulations [14][15].



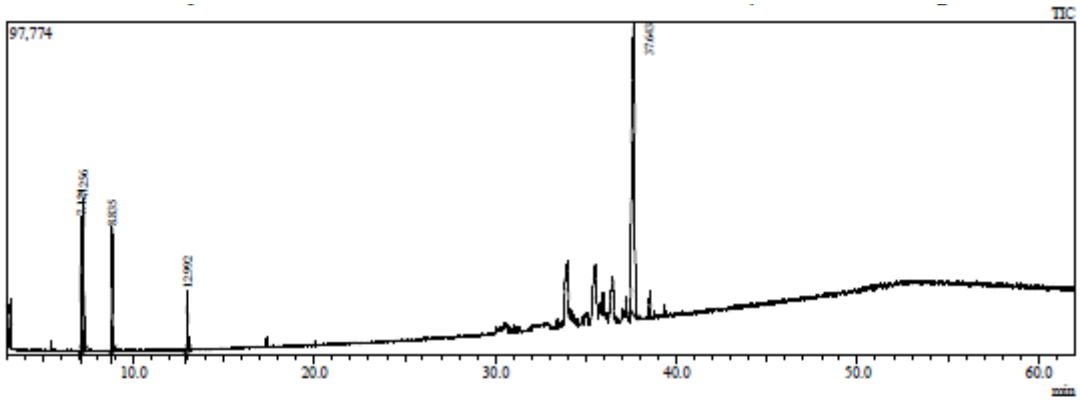


Figure 1. DSC thermograms of D100, B50D50, B50D50+TBHQ, and B50D50+ *R. anatolicus* blends under nitrogen atmosphere. The crystallization onset temperatures (Tonset) are indicated on each curve, showing a progressive reduction from −8.77 °C (D100), -9.78 °C (B50D50), -11.94 °C (B50D50+TBHQ) to −12.04 °C (B50D50+ *R. anatolicus*). The results demonstrate that the addition of *R. anatolicus* extract more effectively delays crystal nucleation compared to the synthetic antioxidant TBHQ, confirming its superior ability to enhance the cold flow and oxidative stability of biodiesel–diesel mixtures.

3.2. GC-MS Spectral Interpretation

GC-MS study indicated that the volatile fraction of *R. anatolicus* Focke extract is mostly composed of fatty acid derivatives and aromatic indane type chemicals. 1-phenyl-1,3,3-trimethylindane, the predominant component comprising 70.17% of the total ion current, is linked to significant radical stability and putative antioxidant characteristics owing to its aromatic ring and indane configuration [16]. Compounds eluting in the first retention area, such as 2-hexenal (8.16%), 3-hexen-1-ol (9.98%), and heptan-2-ol (7.89%), are identified as distinctive lipid peroxidation products in plant tissues, noted for their interactions with biological membranes and free radical scavenging properties. Furthermore, 3-hexen-1-ol acetate (3.80%) constitutes the oxygenated ester component that enhances the fragrance character of the extract. These data indicate that *R. anatolicus* possesses a volatile composition abundant in phenolic-aromatic structures, which may provide considerable antioxidant activity. Consequently, the extract may be regarded as a viable natural addition for mitigating oxidative stress and enhancing the stability of oxidation-sensitive systems, such as biodiesel.

Peaks correspond to (1) 2-Hexenal (2E-) (RT: 7.121 min, 8.16%), (2) 3-Hexen-1-ol (RT: 7.256 min, 9.98%), (3) Heptan-2-ol (RT: 8.835 min, 7.89%), (4) 3-Hexen-1-ol acetate (3Z-) (RT: 12.992 min, 3.80%), and (5) 1-Phenyl-1,3,3-trimethylindane (RT: 37.643 min, 70.17%).

CONCLUSION

This work comprehensively assessed the antioxidative stabilization efficacy of *R. anatolicus* Focke extract in biodiesel–diesel blends using a combined analytical methodology of GC–MS and DSC. The GC–MS analysis indicated that the extract has a phytochemical composition primarily characterized by phenolic-aromatic and lipid-derived bioactive compounds, recognized for their radical scavenging abilities and inhibition of oxidative degradation. The integration of the extract into B50D50 blends at 3000 ppm markedly improved oxidative resistance and cold flow characteristics, as demonstrated by the substantial decrease in crystallization start temperature and the postponed oxidative exothermic transitions seen in DSC analysis.

In comparison to the commonly utilized synthetic antioxidant TBHQ, *R. anatolicus* extract exhibited enhanced inhibition of crystal nucleation and oxidation start, highlighting its ability to effectively disrupt the autooxidation propagation pathways of unsaturated fatty acid methyl esters. The findings underscore *R. anatolicus* extract as a viable, environmentally sustainable ingredient that can reduce fuel degradation during storage and broaden the operational temperature range of biodiesel-diesel blends.

This study establishes a scientific basis for the valorization of *R. anatolicus* as a renewable natural stabilizer, facilitating the advancement of environmentally friendly, sustainable biofuel compositions. Future research will concentrate on long-term storage studies, optimization of extract content, and potential synergistic interactions with commercial antioxidants to enhance stabilization efficiency and expedite industrial application.

ABSTRACT:

Fiber-reinforced composites are structures formed by combining substances of different origins. The use of fibers, fabrics, knitted or nonwoven materials with diverse geometrical and mechanical properties enables the creation of composites with a wide range of characteristics. The addition of various fillers further expands their diversity. Composites based on oriented or randomly arranged fibers solve numerous engineering challenges. Directionally aligned fibers are especially important for producing rotational parts such as cones and cylinders requiring high strength. In the winding method, fibers pre-impregnated with a polymer matrix are wrapped around a mold and cured. Both twisted and untwisted yarns can be used, and productivity increases with multifilament bundles. Layered textile composites are formed by bonding fibrous layers using thermal, adhesive, stitching, or impregnation techniques. Matrices may include thermoplastics (polyethylene, PVC, polystyrene) or thermosetting polymers and resins (epoxy, polyester, etc.). Due to their multifunctionality, composites are used in sorbents, filters, medical applications, hygiene products, clothing, and electronics. For use in aggressive environments, fibers are carefully selected—organic, glass, carbon, polyamide, polyester, polyacrylonitrile, and polyolefin fibers, each suited for specific applications.

Keywords: fiber-reinforced composites, fibers, winding, polymers, thermoplastics, textile composites, applications.

INTRODUCTION

In recent years, significant progress has been made in the development of technical textiles, including improvements in structural composition, quality, and cost efficiency, alongside the recycling of industrial and household wastes. A key area of advancement is the fabrication of fiber-reinforced composite materials, defined as integrated structures combining two or more constituents of different natural or synthetic origins. Using diverse fibrous materials—fibers, fabrics, knitted or nonwoven textiles—with varied geometrical and mechanical properties, and selecting appropriate fillers, enables the creation of composites with tailored performance. Composites may feature oriented or randomly distributed fibers, woven or structured textiles, to address a wide range of engineering challenges. For circular or axisymmetric components, such as cones and cylinders, directed fibers pre-impregnated with polymers or resins are wound onto mandrels, cured, and subjected to quality control. Both twisted and untwisted yarns (rovings) can be used, often in bundles of 60–100 yarns to improve productivity. Layered textile composites are multifunctional structures combining two or more fibrous components through thermal bonding, lamination, weaving, stitching, pressing, or polymer impregnation. Layers may include single- or multi-layer fabrics, knitted or nonwoven textiles, polymer films, and sometimes metallic or non-metallic sheets, allowing customization of physical and mechanical properties for specific applications [2], [3]. The polymer matrix, serving as the binding phase, can be selected from various groups of polymers with differing characteristics. Thermoplastic polymers such as polyethylene, polyvinyl chloride, and polystyrene are commonly employed, while thermosetting polymers and resins—such as epoxy, rubber, and polyester—are also widely used for producing durable and heat-resistant composites. Owing to their structural diversity and adaptability, composite materials find extensive use in both industrial and domestic applications. Their approximate distribution by field of utilization is as follows: sorbent materials – 22%, hygiene products – 16%, lubricants – 3%, electronic applications – 1%, filtration systems – 23%, clothing – 6%, molten alloy processing – 2%, medical uses – 19%, elastomers – 6%, and other areas – 2% /3/. This wide range of applications demonstrates the potential of fiber-reinforced composites to replace conventional materials in demanding environments. During service, technical-grade composite materials are subjected to various aggressive influences, including exposure to chemical environments, elevated or fluctuating temperatures, and mechanical loads. These operational factors determine the appropriate selection of fiber types. Among the most frequently used are organic fibers—such as glass, carbon, polyamide, polyester, polyacrylonitrile, and polyolefin fibers—which offer a balance of strength, flexibility, and resistance to external impacts [4]. The fundamental properties of several inorganic fibers, which are also employed in advanced composite systems, are summarized in Table 1.

Table 1. Main Properties of Inorganic Fibers

Fibers	Diameter, µm	Density, q /cm3	Melting point Temp. °C	Elastic (or Young's) modulus, GPa	Tensile strength, GPa
Glass fibers, types A and C	0,5…30	2,5…2,6	700…900	50…70	1,5…2,0
Glass fibers, types E and S	3…30	2,6…2,8	900…1000	70…90	2.0…5,0
Basalt fibers	10…18	2,7…2,9	100…1200	70…90	1,8…1,9
Boron fibers	100…150	2,4…2,6	2100…2500	380…430	2.5…4
Carbon fibers	6…10	1,4…2,0	3000-dən az	20…700	0,5…5

The incorporation of glass fibers into composite materials is primarily due to their high mechanical strength and exceptional resistance to thermal, biological, and chemical influences. Glass fiber–reinforced composites are characterized by their smooth surface, low weight, hygienic properties, and resistance to corrosion and scaling. In addition, their ease of installation and a variety of other advantageous properties make them highly valuable for use in interior and construction applications.

Pipes manufactured from glass fibers and polymer matrices have successfully replaced conventional materials in both hot and cold water supply systems. These pipes can reliably operate at temperatures of up to +95 °C [5].

Boron fibers, being semiconductive in nature, endow their composites with low thermal and electrical conductivity, thereby determining their functional applications. Composites reinforced with boron fibers exhibit hardness comparable to that of diamond. In insulating materials, boron fibers are utilized in various hybrid compositions and structural configurations to achieve optimal performance [6].

Silicon carbide fibers demonstrate lower mechanical performance compared to carbon and boron fibers; however, their outstanding heat resistance makes them suitable for use in metal–matrix composites, particularly those exposed to elevated temperatures.

RESEARCH AND CONCLUSIONS

Compared to natural fibers, synthetic fibers generally possess superior mechanical characteristics and greater chemical stability. These features make them preferable for the production of technical fabrics as well as fiber-reinforced composites intended for industrial applications. The mechanical properties of several types of specialty fibers are summarized in Table 2.

Table 2. Mechanical Properties of Selected High-Performance Fibers

Fibers	Thickness, µm	Density, g/cm³	Tensile strength at break, MPa, at 65% relative humidity	Elastic modulus (or Young's modulus), GPa, at 65% relative humidity
Special-purpose chemical fibers:				
Heat-resistant:				
Poly(p-phenylene isophthalamide), Nomex		1380	620-690	12-13
Polysulfonamide, Sulfon-T		1450	510-580	6,0
Polyamide, Aramid		1410	635-850	10,4-15
High strength and high modulus fibers:				
Poly(p-phenylene terephthalamide), Kevlar	7-11	1450	2250-3500	65-128
Carbon fibers:			2500-3200	200-250
High strength	7-11	1800-2000		
High modulus	5-100		2000-2500	300-700
Glass fibers		1800-2000		
		2250-2580	600-7000	50-100

In terms of thermal characteristics, carbon fibers surpass all other fiber types, as they can withstand temperatures ranging from **1650 °C to 2100 °C** in an inert atmosphere. This exceptional heat resistance results from the unique combination of high strength and low density, which gives carbon fibers outstanding **specific mechanical properties**.

Based on mechanical performance, carbon fibers are classified into two main categories: high-strength/high-modulus fibers and fibers with lower strength levels. In technical composites, carbon fibers are primarily employed where high stiffness and strength are critical [8]. However, a significant limitation of carbon fibers is their sensitivity to atmospheric oxygen; despite their high thermal stability, their effective operating temperature in air does not exceed 300–350 °C, above which oxidation leads to degradation and mass loss [9].

A recent development in this field is carbon–carbon composite materials (CCCMs), comprising carbon fibers embedded in a carbon-based matrix. CCCMs combine high chemical resistance, low density, and tunable electro-physical properties, including adjustable thermal conductivity and electrical resistivity [1]. The carbon matrix closely matches the fibers in physical and chemical characteristics, particularly thermal resistance, enhancing structural stability, mechanical integrity, and dimensional stability by preventing relative fiber displacement. To mitigate oxidation, CCCMs often feature a thin ceramic surface coating [8].

In fiber-reinforced composites, the matrix typically consists of thermosetting resins (phenolic, epoxy, polyester) or thermoplastic polymers (polyamide, polyethylene, polystyrene), serving as a binding and load-transferring medium to unify the fiber assembly into a solid material [8]. Composite properties are determined primarily by fiber characteristics, including arrangement, geometry, mechanical performance, and volume fraction, resulting in materials with enhanced functionality. Composites reinforced with carbon or aramid fibers exhibit high strength-to-weight ratios, making them ideal for aerospace, aviation, shipbuilding, and automotive applications.

Several reinforcement architectures are employed:

- Random or oriented fiber arrangements (nonwoven or felt-like structures);
- Unidirectional fibers (yarns, tapes, rovings);
- Bidirectional reinforcements (single-layer woven or knitted fabrics);
- Three-dimensional (3D) fiber architectures, formed by interlacing single- or multilayer fabrics into volumetric structures.

Composite anisotropy can be controlled by adjusting fiber orientation and layer configuration. Achieving isotropic strength often involves 3D woven textile frameworks, which provide structural integrity in all three spatial directions even prior to matrix impregnation. Advanced weaving techniques enable the fabrication of multilayer woven fabrics, where primary (warp) layers are longitudinal and secondary (binding) layers are perpendicular or angled, ensuring optimal load distribution and mechanical performance.

The strength and rigidity of the auxiliary threads depend on their angular orientation relative to the primary layers. By optimizing the placement of the warp, weft, and binding threads, it becomes possible to achieve a partially isotropic behavior in the final composite. In multilayer woven structures, the junction points of auxiliary layers should ideally be concentrated near the central plane of the fabric, as this arrangement significantly enhances its longitudinal strength and stiffness.

As in all engineering fields, the primary goal in composite material production is the continuous enhancement of physical and mechanical properties, thereby increasing performance and expanding potential applications. Both single-layer and multilayer fabrics can be utilized in composite fabrication to achieve a balanced mechanical response. Achieving isotropic fiber-reinforced composites requires multilayer fabrics that, even before polymer impregnation, possess sufficient strength in all three spatial directions.

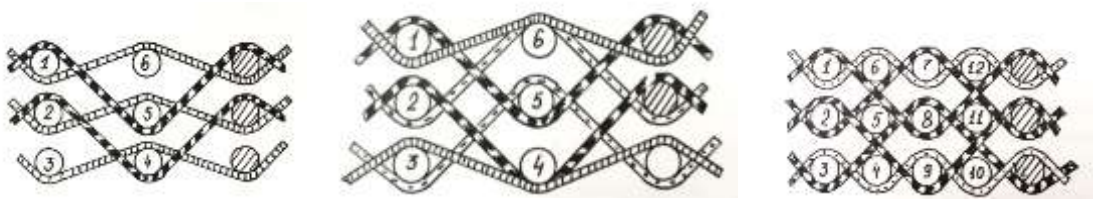
Three-dimensional structured fabrics with enhanced strength and rigidity are produced by interlinking horizontally oriented layers (base or framework layers) using two-layer or multilayer interweaving techniques. These structures provide high resistance to delamination, bending, and abrasion, significantly improving the durability of the resulting composites.

The interlayer binding method serves as the principal structural element in multilayer fabrics. Depending on the technique, multilayer woven fabrics are classified into two main groups, each with two subclasses:

First Group: Layers are interconnected via additional (binding) warp threads:

1. **First class** — all layers are joined by one or several additional warp threads.

2. **Second class** — two sets of additional warp threads (upper and lower) connect the layers, but neither set interconnects all layers simultaneously. The connection depth and pitch vary depending on structural requirements.



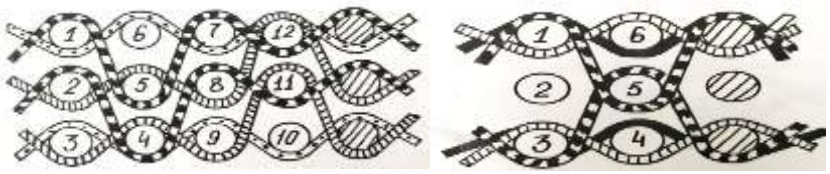
Second Group: Layers are interconnected using the warp threads of the layers themselves:
3. **Third class** — warp threads pass from one layer to another in a defined interlacing pattern, creating structural linkage.
4. **Fourth class** — all warp threads sequentially act as binding threads, forming comprehensive interconnections across all layers.

For composite production, fabrics of the second group—particularly the third and fourth classes—are considered most suitable. Within the third class, interlayer binding can be subdivided based on the number of threads involved:

- **First subclass:** Each layer is connected to the adjacent layer by a single warp thread, yielding the number of interconnections B=n−1B = n - 1B=n−1, where nnn is the total number of layers.

- **Second subclass:** Two warp threads connect each layer, giving B=n−2B = n - 2B=n−2.

Illustrations of the **interlayer binding schemes** for the third class (subclasses a, b, and c) are presented in **Figure 1**.



a) Binding step = 1 b) Binding step = 1 c) Binding step = 2

Figure 1. Methods of layer interconnection for the **third-class multilayer fabrics**: subclass (a) — first, and subclasses (b) and (c) — second type of interlayer binding.

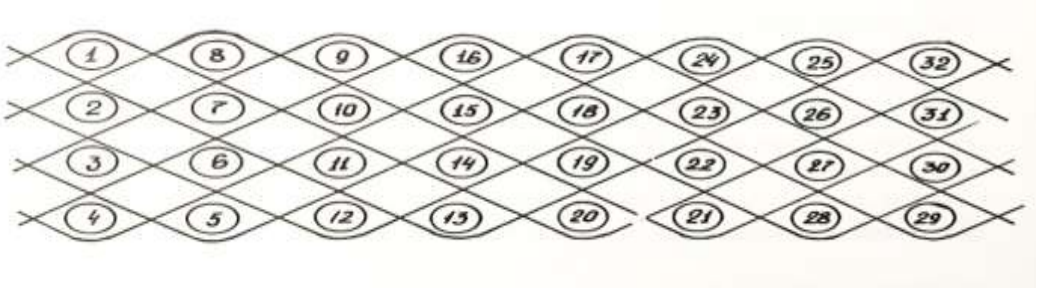
A characteristic feature of the **third subclass** is that all layers are interconnected by the warp threads of two adjacent layers. However, when the **binding step equals one**, the connection between layers becomes discontinuous at every third, fifth, and subsequent weft thread insertion, interrupting the continuity of interlayer binding.

In the **fourth subclass**, by contrast, each upper and lower binding thread connects only to the **central portion of the intermediate layers**, creating partial interlinking zones rather than continuous connections throughout the fabric structure (see **Figure 2**).

a) Third subclass b) Fourth subclass

Figure 2. Interlayer binding methods for third-class multilayer fabrics: (a) third subclass and (b) fourth subclass.

The fourth class of multilayer fabrics differs fundamentally from all the previous ones. In this structural configuration, every warp thread acts as a binding thread, simultaneously performing both structural and connective functions. As a result, all layers of the fabric are fully interconnected, forming a highly stable and cohesive three-dimensional framework (see Figure 3).



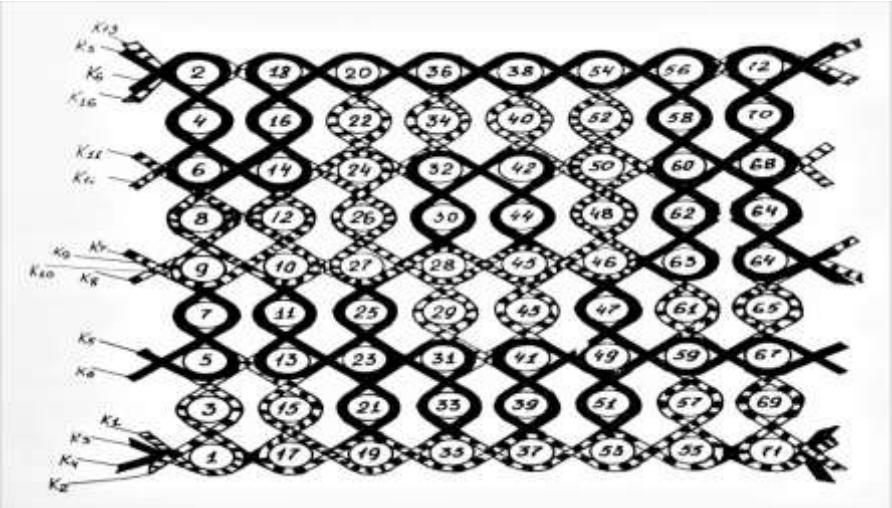


Figure 4. Layer binding method in fourth-class fabrics

From a technological perspective, the production of such structured fabrics does not require significant structural modifications to the weaving loom. Depending on the fabric's structural characteristics, two or more warp beams, or individual spools, can be used for the warp threads. If the warp threads in the primary (carcass) and auxiliary (filler) layers have the same properties and the same working length within the fabric, a single warp beam can be employed.

The schematic of the fabric's longitudinal section produced from an eight-end warp system is shown in Figure 4. In this fabric structure, the warp threads are simultaneously used to form both the primary (carcass) layers and the auxiliary (filler) layers. Since each layer is woven into a complete fabric, 16 warp threads (K1, K2, K3,..., K16) participate in the warp repeat, while the heald (1,2,3,...,72) repeat consists of 72 threads. As all warp threads within the repeat have equal lengths, a single warp beam can be utilized.

To maintain appropriate tension on the loom, spring-loaded rods are installed. These rods ensure that each warp thread, waiting its turn, is held under the required tension throughout the weaving process.

When examining the longitudinal section of the fabric, it can be observed that the vertical (auxiliary) layers are interconnected through common heald threads, forming a continuous primary layer. For example, heald threads 1, 17, 19, 35, 37, 53, 55, and 71 are shared among the warp systems K1, K2, K3, and K4.

In the production of fiber-reinforced composites, the most commonly used method is impregnation, which consists of saturating the carcass with a filler solution (matrix). There are several methods of impregnation:

- Vacuum casting: pouring the matrix mixture onto the fibrous material placed in a press mold.
- Pressure impregnation: forcing the matrix into the fibrous material under pressure.
- Centrifugal casting: using centrifugal force to distribute the matrix through the fibrous structure.

Modern polymer science has enabled the production of polymer-matrix composites with predictable and tailored properties. Their high mechanical performance, manufacturability, and versatility have ensured wide application across various sectors of the national economy.

CONCLUSIONS

1. In modern times, significant efforts are being made to increase the variety, improve the structural design, enhance the quality, and reduce the cost of fiber-reinforced composites for technical applications.

2. For large-volume composites, the use of three-dimensional fibrous materials is more appropriate, taking into account both the carcass preparation and the structure of the textile component.

3. To obtain isotropic fiber-reinforced composite materials, it is necessary to produce multi-layer fabrics on a weaving loom that possess sufficient strength in all three directions before impregnation with the polymer matrix.

4. Filler solutions (matrix) can include polymers with various properties, such as thermoplastic and thermosetting polymers and resins

ABSTRAKT:

Abrasion resistance is one of the key physical and mechanical properties of technical fabrics, as abrasion causes wear through friction with hard surfaces. For fabrics used in composite materials, high wear resistance is essential and depends on proper material selection, production technology, and fabric structure design. Such composites typically use multilayer fabrics made of carbon and other fibers. Wear begins when surface threads, in direct contact with abrasive materials, are damaged. The supporting surface area-determined by fabric density, structure, and weave-affects resistance. Poor wear resistance reduces durability and reliability in both technical and household fabrics. To enhance abrasion resistance and extend service life, durable fabric structures with interlaced outer layers were developed. These fabrics combine multilayer and layered-frame weaves, incorporating filling threads. The vertical filling layers are connected by common weft threads to inner frame layers, forming a boundary between multilayer and layered-frame sections. Using laminated frame fabrics with multilayer interlacing as reinforcement in composites minimizes delamination during manufacturing and use, increasing strength and longevity. Layered-frame fabrics with filling warp threads offer improved rigidity, strength, and wear resistance when thread types and weaves are properly selected. Different yarn compositions require separate winding from distinct spools.

Keywords: wear resistance, frame yarns, filling yarns, layered-frame fabric, multilayer weave

INTRODUCTION

One of the key physical and mechanical characteristics of technical textiles is their resistance to abrasion. Abrasion refers to the progressive surface damage caused by friction resulting from contact with harder or rougher materials. During the abrasion process, the gradual degradation of the fabric's structural integrity leads to a deterioration in its mechanical properties. Typically, wear begins with the yarns located on the surface that comes into direct contact with the abrasive medium. In such cases, the yarns forming the fabric's outer supporting layer are the first to experience mechanical stress [1.3,4,7].

The extent of the supporting surface largely depends on the structural parameters of the fabric, such as its density, weave pattern, and phase composition. The durability of this surface against abrasive destruction is influenced by numerous factors, including the warp and weft densities, the degree of interlacing between yarns, the fiber length within the yarns, the level of twist, the weaving technique, and the smoothness or compactness of the threads in the textile structure. Under otherwise identical conditions, an increase in the supporting surface area corresponds to an improvement in the fabric's wear resistance.

Insufficient abrasion resistance, whether in technical or consumer fabrics, leads to reduced service life and diminished reliability during operation. This phenomenon manifests through the deterioration of key mechanical properties such as stiffness, tensile strength, and elasticity, as well as aesthetic attributes like surface gloss, color stability, and texture. Worn fabrics may develop holes, exhibit fuzziness, lose color saturation, and display increased air permeability or disruption of the weave pattern.

At present, fiber-reinforced composite materials are extensively utilized in diverse high-performance fields, including the automotive and aerospace industries, astronautics, medicine, fusion reactor engineering, and sports equipment manufacturing. The incorporation of fibrous reinforcement within a composite matrix allows these materials to achieve levels of physical and mechanical performance unattainable by conventional materials. The efficiency and distinctiveness of such composites arise from the spatial configuration of the fibrous phase, the internal structure of the reinforcement, and the properties of the constituent materials. For instance, carbon-fiber-reinforced composites are notable for their chemical inertness, low density, favorable electrophysical properties, and tunable thermal and electrical conductivities [2,5,8,9].

During service, composite materials are often subjected to cyclic and localized abrasive stresses, which may result in non-uniform wear.

The progressive degradation of mechanical properties in affected regions can ultimately render the entire product unsuitable for further use.

To address these challenges, researchers are developing textile structures that utilize different types of yarns for surface and inner layers, thereby optimizing performance under specific loading and wear conditions. Composites composed of a reinforcing woven framework embedded within a polymer matrix can exhibit diverse mechanical behaviors and spatial configurations. By controlling the interlacing pattern of the reinforcing yarns and selecting high-strength, high-modulus fibers, it is possible to design textile-reinforced composites with enhanced abrasion resistance and improved durability.

Fabrics that demonstrate the highest resistance to wear are typically those composed of fibers capable of withstanding repeated stretching and torsional deformations. Such materials include synthetic fibers like polyamide and nylon, as well as natural fibers such as wool, linen, and

cotton. Despite their high tensile strength, synthetic filaments generally exhibit lower inter-fiber adhesion and greater extensibility. The term spreading refers to the displacement of warp and weft yarns under the influence of external mechanical stresses. This phenomenon is most frequently observed during garment use, particularly in areas subject to repeated strain—such as sleeve armholes, collars, pockets, elbows, knees, and regions adjacent to seams. Spreading is primarily caused by insufficient frictional interaction between yarns and low tangential resistance. Smooth synthetic fibers, including acetate silk, display a particularly high tendency toward spreading.

This property poses considerable challenges both during fabric processing and throughout the operational lifespan of textile products. Furthermore, the abrasion resistance of synthetic fibers tends to decline as the surface temperature of the material increases. This reduction is associated with the formation of static electrical charges on the fabric surface, which contribute to diminished frictional resistance and, consequently, to faster surface wear [10,13,14].

In multilayer frame fabrics—a class of multilayer textiles—the outermost layers are typically subjected to the greatest abrasive stress. These layers are composed of the interlacing of frame, filler, and weft yarns. The resistance of such fabrics to abrasion largely depends on the surface condition, the type and length of the constituent fibers, and the degree of yarn twist. Fabrics in which the warp and weft yarns are evenly distributed across both surfaces tend to demonstrate superior resistance to wear.

RESEARCHES

To enhance the abrasion resistance of the surface layers in laminated frame fabrics and extend their operational lifetime, we have developed fabric structures in which the outer frame layers are interlinked through additional binding. These constructions integrate the design principles of multilayer and layered-frame interlacings while incorporating filler yarns into the overall structure. This approach allows for a more stable fabric architecture, improved load distribution, and enhanced durability under abrasive conditions [7,8.9.10,11]. A schematic representation of a layered frame fabric with a three-layer surface structure is shown in Figure.1.

The process of manufacturing a wear-resistant textile can be illustrated using the example of a layered-frame fabric. Figure 4 presents a schematic diagram of the longitudinal cross-section of this material.

As indicated by the interlacing pattern, the fabric consists of three horizontal frame layers on each side, arranged longitudinally, and six vertically oriented filling layers. Each system of warp threads (both the primary and filling systems in this design) undergoes specific processing and possesses distinctive weaving characteristics in its interaction with the weft yarns. Consequently, each thread system must be supplied to the fabric formation zone from separate warp beams to ensure proper structural configuration.

The weave repeat for the warp system comprises 14 threads (12 + 2), while the weft system consists of 66 threads. As shown in the figure, only the internal frame layers are interconnected with the filling layers by shared weft threads (specifically, threads 3, 20, 25, 42, 47, 64 and 9, 14, 31, 36, 53, 58).

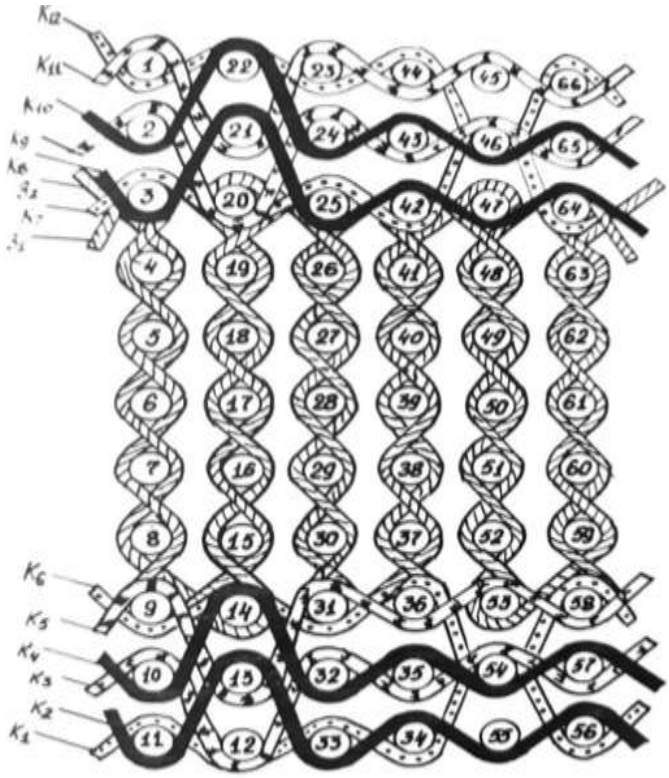

Figure 1. Schematic representation of a layered-frame fabric with three layers on each side. K1–K12 denote the main (frame) threads, 31–32 indicate the main (filling) threads, and 1–66 correspond to the weft threads.

The laminated frame fabric structures with wear-resistant surfaces described above provide enhanced structural integrity, durability, and reliability of the composite materials derived from them. The outer surface layers of these fabrics can be regarded as distinct zones in terms of wear exposure. As illustrated in the schematic, the degradation of the outer layers does not compromise the overall structural integrity of the layered-frame fabric or the composite material based upon it. Delamination occurs only when the inner frame layer, which is directly connected to the filling layer, undergoes structural failure.

Furthermore, surface layers composed of yarns of contrasting colors enable visual monitoring of the wear process and allow for an approximate assessment of wear depth.

Thus, laminated frame fabric constructions with reinforced, wear-resistant surfaces not only improve the mechanical strength characteristics but also contribute to the extended service life and operational reliability of composite materials produced on their basis.

One approach to improving the abrasion resistance of laminated frame fabrics is the introduction of stiffer threads into their structural composition. These additional filaments, hereafter referred to as fillers, enhance not only the wear resistance of the surface layers but also the overall dimensional stability of the fabric. Within the fabric architecture, the filler threads are not subjected to significant bending stresses, as they do not interlace directly with the weft system. Instead, they either extend between adjacent vertical layers or are positioned in the spaces separating the horizontal frame layers. Figure 2 presents a schematic longitudinal section of a layered-frame fabric incorporating filler threads (fillers).

During the weaving process, six warp beams are mounted on the loom: two carrying the frame warp threads, one supplying the filling warp threads, one for the vertical filling threads, and

two for the horizontal filling warp threads. Owing to the high density of the warp system, the heddle harnesses are consolidated. Such a configuration is typically employed when the fabric structure incorporates multiple types of interlacing.

The operational parameters of the loom during the production of layered-frame fabrics with filler threads are presented in **Table 1**, while **Table 2** summarizes selected structural characteristics of two variants of layered-frame fabrics — one incorporating filler warp threads and the other produced without them.

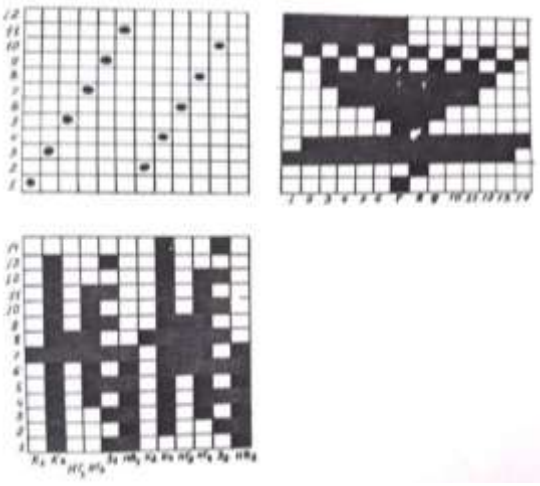

Figure 2. Longitudinal section and filling pattern of a layered-frame fabric with filler threads. К1–К4 indicate frame warp threads; 31–32, filling warp threads; НГ1–НГ2, horizontal filling threads; НВ1, vertical filling threads; and 1–14, weft threads within the fabric repeat

In layered-frame fabrics incorporating filling warp threads, the warp systems undergo different processing conditions. Within such fabrics, it is important to distinguish between working out (yarn utilization in the structure) and yarn consumption.

This distinction arises because the frame and filling warp threads, despite having the same weave pattern, occupy different spatial positions within the fabric architecture.

The frame warp threads interlace with the weft yarns and undergo bending, while the filler threads also interact with the weft but are simultaneously fixed within the frame layers. As a result, the filler threads acquire transverse, perpendicular, or inclined orientations relative to the primary frame system. Consequently, the degree of working out for the filling warp threads is substantially higher than that of the frame warp threads.

For instance, in the previously discussed layered-frame fabric structure containing filling warp threads, the working out of the filling warp system reaches **77.0%**, which is approximately **11.7 times greater** than that of the frame warp system. Correspondingly, the surface density and mass per unit volume of the fabric more than double, while no significant change is observed in overall fabric thickness

Table 1. Parameters of loom configuration during the manufacturing of a layered-frame fabric incorporating filler threads.

CONCLUSIONS

1. The use of laminated frame fabrics with multilayer interlacing elements in the outer layers of composite materials, serving as reinforcement, effectively reduces the risk of delamination during both fabrication and operation. This contributes to enhanced reliability and extended service life of the resulting products.

2. Layered-frame fabrics incorporating filler warp threads can achieve increased rigidity, strength, and wear resistance when the threads and weave patterns are appropriately selected. In particular, combining a multilayer weave of rigid yarns for the outer layers with yarns possessing tailored physical and mechanical properties for the inner layers optimizes overall fabric performance.

3. Owing to the differences in processing and fiber composition among the various warp systems (frame, filler, and auxiliary threads), the warp must be supplied from separate beams to ensure proper fabric formation and structural integrity

ABSTRACT

This study investigates the applicability of the Acoustic Emission (AE) method for early crack detection under field conditions on a heavy-duty concrete mixer chassis. Failure to detect fatigue-induced cracks at an early stage in welded steel structures can lead to severe structural damage and safety risks. The AE method enables the detection of damage at the moment it occurs by capturing sudden energy releases within the material. In this study, a commercial AE sensor (R15α) and a low-cost V1 prototype sensor were evaluated together. MATLAB analyses showed that the normalized peak amplitude was measured as 1.0044 for the R15α sensor and 0.9243 for the V1 sensor, indicating that the V1 sensor produced 7.97% lower amplitude compared to R15α. However, the maximum correlation coefficient between the two sensors was found to be 1.000, demonstrating that their signal shape and timing almost perfectly overlap. The results show that the AE method is suitable for real-time early crack detection in heavy-duty chassis structures and that the V1 sensor provides a cost-effective alternative for field applications.

Keywords: Acoustic Emission, welded structures, early crack detection, field application, sensor comparison.

1. INTRODUCTION

Welded steel structures are critical components used in heavy-duty vehicles, construction machinery, pressure vessels, and industrial carrier systems that operate under high cyclic loading. Fatigue cracks frequently occur in the weld bead, root region, and heat-affected zone (HAZ), threatening the structural integrity of these systems. Cracks that initiate at the microscopic scale propagate under repeated loading and evolve into macroscopic damage, significantly reducing the load-bearing capacity of the equipment (Grosse & Ohtsu, 2008; Pollock, 2012; Shiwa & Ohtsu, 2000). Therefore, early detection of crack initiation is crucial for operational safety and maintenance efficiency in heavy-duty structures.

Conventional non-destructive testing (NDT) methods (UT, MT, PT, RT) are limited to periodic inspections and thus cannot capture the precise moment when crack initiation occurs (Scruby, 1987). These methods can identify visible or surface-adjacent defects, yet the early microscopic stages of fatigue cracks often remain undetected. With the advancement of real-time Structural Health Monitoring (SHM) techniques, the Acoustic Emission (AE) method has emerged as a prominent technology for early detection of fatigue damage. According to the ASTM E1316 standard, AE is defined as the detection of elastic waves generated by sudden energy releases within a material (ASTM E1316, 2020).

Experimental studies have demonstrated that AE parameter such as amplitude, energy, hit count, rise time, and frequency spectrum are directly linked to crack initiation and propagation mechanisms (Sachse & Kim, 1980; Gorman, 1991; Ohtsu, 2019; Miller & McIntire, 1987). Research on the frequency characteristics of AE signals indicates that resonance-type sensors operating within the 100–300 kHz frequency band exhibit high sensitivity to micro-cracks in welded steel structures (Shiwa & Ohtsu, 2000; Gorman, 1991). Furthermore, the ASTM E976 standard provides guidelines for verifying the frequency response of AE sensors, serving as a reference for proper sensor selection in field applications (ASTM E976, 2015).

Despite the proven effectiveness of AE in laboratory conditions, its applicability in field environments particularly in heavy-duty vehicles remains limited. Hydraulic motor vibrations, road-induced shocks, gearbox interactions, and environmental noise may elevate the noise floor of AE measurements and adversely affect signal accuracy (Shinde & Ravisankar, 2020; Chen et al., 2021). Therefore, sensor placement, coupling materials, filtering strategies, and signal processing techniques must be specifically optimized for real field conditions.

Concrete mixer trucks are especially prone to fatigue damage due to the continuous rotational torque, hydraulic drive mechanisms, and variable dynamic loads acting on the chassis. Dynamic effects originating from the rotating drum, gear reducer, and chassis vibrations further complicate the AE measurement environment by introducing additional noise sources. The number of studies directly investigating the application of the AE method on heavy-duty concrete mixer structures is highly limited in the literature, which highlights the novelty and relevance of the present study.

In this study, the applicability of the Acoustic Emission method on a heavy-duty concrete mixer chassis under real field conditions is comprehensively investigated. The innovative contributions of this work can be summarized as follows:

- The AE method is applied under real operating conditions on a high-vibration heavy-duty vehicle.
- The commercial R15α sensor and a cost-effective V1 prototype sensor are compared under identical working conditions.

- Field AE signals are analyzed in the MATLAB environment using time–frequency domain techniques.
- The influence of field noise sources on signal quality is evaluated, and suitable band-pass filter ranges are identified.
- Field findings are compared with laboratory data from previous studies, and the applicability of AE for early crack detection in heavy-duty vehicles is discussed in detail.
- This study fills an important gap in the literature regarding the field applicability of the AE technique on heavy-duty vehicles and provides valuable insights for industrial structural health monitoring applications.

2. METHOD

This section presents the experimental setup, sensor structures, the effect of field conditions on AE signals, the data acquisition system, and signal processing methods in detail.

2.1 Experimental Setup

Heavy-duty concrete mixer chassis are complex metal structures that operate under continuous vibration, bending moments, torsion, and impact loads. Therefore, noise sources in AE measurements are abundant. The chassis consists of two longitudinal beams, transverse cross-members connecting them, and multiple welded joints.

The most common regions where fatigue cracks initiate are:

- Connections between longitudinal beams and cross-members,
- Weld seams on the upper plate,
- Load-bearing console regions,
- The vicinity of lower mounting points.

Three areas near these locations were selected as critical regions, and sensor placement was planned accordingly. This section presents the experimental setup, sensor structures, the effect of field conditions on AE signals, the data acquisition system, and signal processing methods in detail (see Fig1 and Fig2).

Figure 1. AE sensors mounted on opposite sides of the concrete mixer chassis

Figure 2. Field deployment layout of the V1 sensors on the concrete mixer chassis

2.2 Sensors and Technical Specifications

Two sensors were compared in this study;

R15α Commercial Sensor

- Wide-band piezoelectric structure
- 150 kHz center frequency
- Industrial-grade metal housing
- High sensitivity and low noise level This sensor is considered a reference commercial solution in the AE literature.

V1 Prototype Sensor

- Low-cost prototype design
- Targets the same center frequency range
- Compact piezoelectric element
- Developed for field testing conditions

The purpose of the V1 sensor is to reduce the overall cost of AE systems while maintaining sufficient measurement accuracy for practical applications.

2.3 Sensor Placement

The placement of sensors directly affects the accuracy of AE measurements. Sensor positions were selected by considering wave propagation paths, weld geometry, and vibration transmission routes.

Installation procedure:

1. The surface was ground to remove paint and irregularities.
2. Surface roughness was reduced using 800-grit sandpaper.

3. A thin layer of acoustic coupling gel was applied.
4. The R15α sensor was fixed using its magnetic base.
5. The V1 sensor was mounted using a bolted clamping mechanism.

This procedure is critical for minimizing transmission losses in AE signals (see Fig-3-4-5).

Figure 3. Positioning of the R15α sensor on the contact surface near the weld zone

Figure 4. Mounting mechanism used in the installation of AE sensors

Figure 5. Mounting and wiring layout of the R15α and V1 sensors

2.4 Data Acquisition System

AE data were collected using a portable AE unit with a sampling frequency of 1 MHz.

Key settings used:

- Sampling frequency: 1 MHz
- Digital band-pass filter: 40–400 kHz
- Preamplifier gain: 40 dB
- Trigger level: 45 dB (avg.)
- Recording mode: continuous data acquisition

This configuration provides sufficient resolution to distinguish AE signals from environmental noise.

2.5 Signal Processing

The analytical formulations used in this section are based on standard AE signal processing definitions. The energy and frequency-center expressions in Equations (1) and (2) follow the conventional formulations presented by Grosse and Ohtsu (2008) and Ohtsu (2019), while the cross-correlation definition in Equation (3) is based on classical digital signal processing theory described by Oppenheim and Schafer (1999).

AE signals were analyzed in MATLAB. The analyses were divided into three main categories.

2.5.1 Time-Domain Analysis

AE energy is calculated using Equation (1):

Equation (1): $E = \Sigma V_i^2$

This expression represents the sum of squared signal amplitudes and provides information about burst energy.

2.5.2 Frequency-Domain Analysis

The frequency-weighted center frequency is computed using Equation (2):

Equation (2): $f_{(c)} = (\Sigma f_i A_i) / (\Sigma A_i)$

This formula is used to detect shifts in the frequency response of the sensors.

2.5.3 Correlation Analysis

The time alignment between two sensors was examined using cross-correlation.

Equation (3): $R_{(xy)}(\tau) = \Sigma x(t) \cdot y(t + \tau)$

The peak at delay τ indicates the time shift between the two sensor signals (Equ-3).

3. RESULTS

This section presents sensor comparisons, MATLAB results, noise analysis of field measurements, and the overall performance evaluation of both sensors (see Fig-6-7-8).

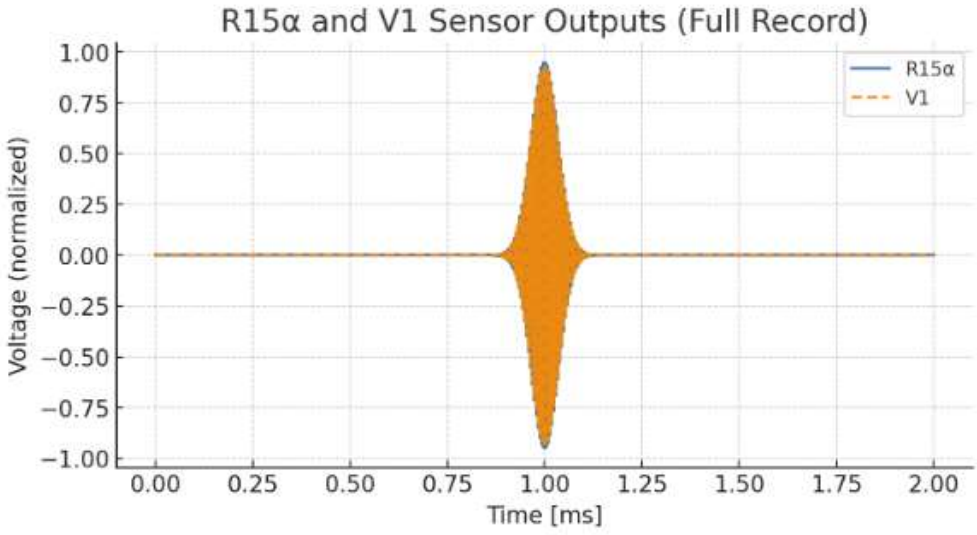

Figure 6. Time-domain signal comparison between the R15α and V1 sensors

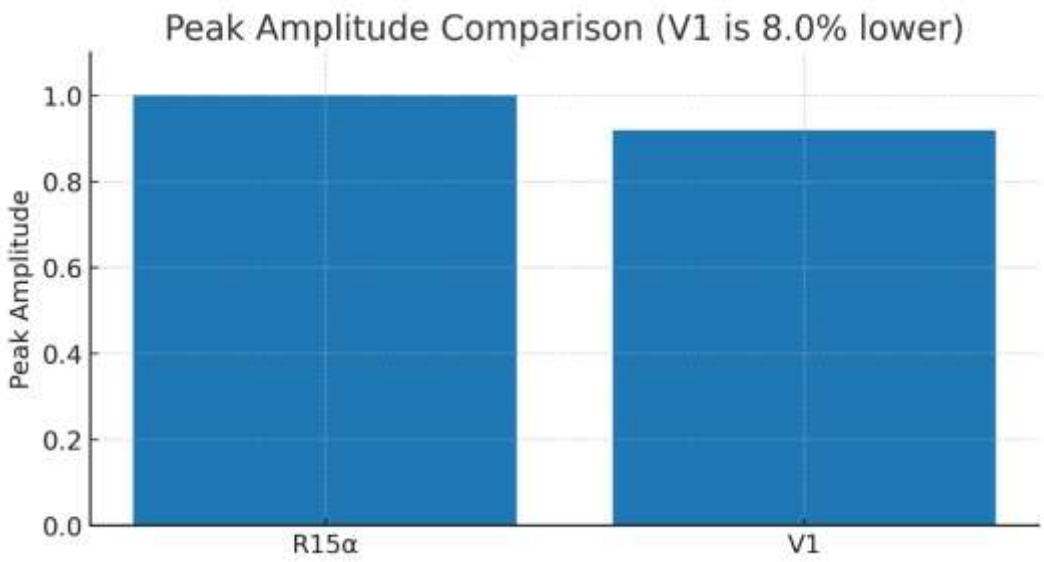

Figure 7. Zoomed view of the AE burst signal and the peak amplitude difference between the sensors

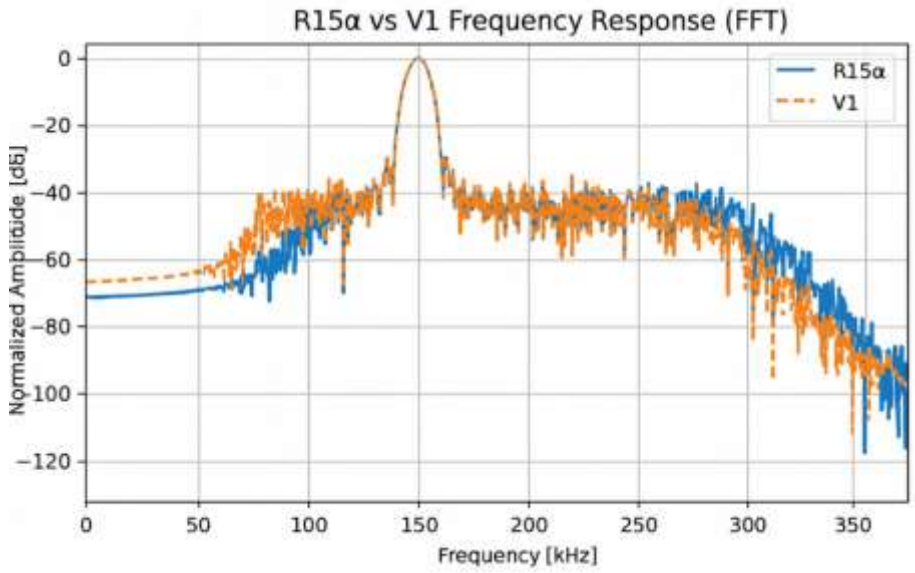

Figure 8. Comparison of the frequency spectra of the R15α and V1 sensors

AE bursts were recorded and normalized separately for both sensors. The results are as follows:

- R15α peak amplitude: 1.0044
- V1 peak amplitude: 0.9243
- Amplitude difference: 7.97% (V1 lower)
- Maximum correlation: 1.000

These results demonstrate that the V1 sensor exhibits nearly identical signal shape performance compared to the R15α.

3.1 Field Noise Analysis

During concrete mixer operation, several noise sources were present:

- Hydraulic motor noise,
- Drum rotation-induced vibrations,
- Vehicle aerodynamic noise,
- Chassis resonances.

Despite the vibration and noise in field conditions, the AE method was successfully implemented.These factors complicate AE signal interpretation. Therefore, filtering and threshold adjustments were critical. The signal-to-noise ratio (SNR) of field data was measured to be between 18–22 dB.

3.2 Sensor Comparison

The performance of both sensors can be summarized as follows:

- R15α: higher amplitude, industry-standard detection capability
- V1: low cost + high correlation advantage
- Both sensors exhibit excellent time alignment

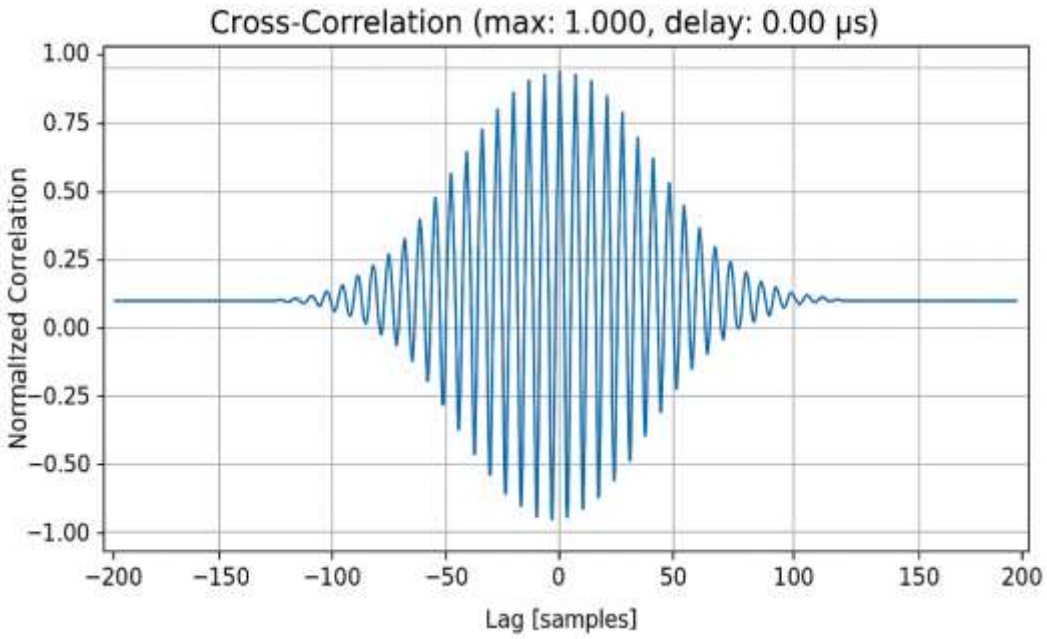

Figure 9. Cross-correlation plot between the R15α and V1 sensor signals

Although the V1 sensor is lower-cost, it demonstrates high accuracy in terms of signal shape and timing (see Fig-9).

4. DISCUSSION AND GENERAL EVALUATION

Despite challenging field conditions, the AE method provided reliable results. The V1 sensor's low-cost design, combined with its strong correlation with R15α, indicates substantial potential for industrial applications. The AE method is significantly more effective than classical NDT techniques in detecting the onset of crack formation.

4.1 Field Performance of the AE Method

Field tests demonstrated that:

- AE signals can be accurately distinguished even in high-noise environments.
- Noise generated by vibrations, mechanical impacts, and hydraulic motors can be controlled through filtering techniques.
- Despite field noise, the signal-to-noise ratio (SNR) remained in the range of 18–22 dB, which is sufficient for AE detection.
- Fatigue cracks in weld zones were observed to produce AE activity at early stages.

4.2 Importance of the AE Technique for Structural Health Monitoring

The AE method is superior to classical inspection techniques due to its continuous monitoring capability, detection of damage at the moment it occurs, and ability to localize sources. (Scruby, 1987; Miller & McIntire, 1987).

Engineering advantages include:

- Integration into early warning systems
- Reduction of unexpected downtime
- Decreased maintenance costs
- Detection of structural damage before it propagates

4.3 Recommendations for Future Work

- Source localization can be achieved using multi-sensor layouts.
- Sensitivity of the V1 sensor may be improved by testing different prototype variants.
- Machine learning methods can be applied for AE signal classification.
- Different loading conditions on the chassis can be evaluated.
- Field tests can be extended to other vehicle types.

5. CONCLUSIONS

This study comprehensively investigated the applicability of the Acoustic Emission (AE) method for early crack detection on a heavy-duty concrete mixer chassis. The advantages of AE in structural health monitoring were successfully validated despite challenging field conditions. Sensor comparisons, the influence of field noise on AE measurements, and MATLAB analyses provided valuable engineering insights.

ÖZET

İnsan vücudu birçok kemik türünden oluşur. Bu kemiklerde meydana gelen kırıkların hızlı tespiti büyük önem taşımaktadır. Tibia plato kırığı diz eklemi içindeki proksimal tibiada meydana gelen bir kırığı ifade eder. Geleneksel X-ışını görüntülemesi, ortopedik uygulamalarda kırık tanımada sıkça kullanılmakta olup hızlı ve basit avantajlar sunar. Ancak, artan tıbbi talep ve sınırlı sağlık kaynakları klinisyenler üzerinde baskı oluşturarak yanlış tanı riskini artırmaktadır. Bu nedenle, kırıkların hızlı tespiti için güvenilir yardımcı yöntemler geliştirmek gün geçtikçe önemli hale gelmiştir. Yapay zekâ ve özellikle evrişimli sinir ağları (ESA), görüntü analizinde üstün özellik çıkarma ve desen tanıma yeteneği sunarak tıbbi tanı süreçlerinde devrim yaratmaktadır. Çalışmamız kapsamında ESA modelleri kullanılarak Tibia plato kırığı tespiti için yumuşak oylama temelli yeni bir yöntem ortaya koyulması hedeflenmiştir. Bu amaçla tibia plato kırığı olan 260 adet Ön, 260 adet Yan çekim X-Ray görüntüsü ve herhangi bir kırık bulgusu olmayan 260 adet normal X-Ray görüntüsü kullanılmıştır. Veri seti, önerilen ESA modellerini eğitmek, doğrulamak ve test etmek için rastgele eğitim (%70), doğrulama (%15) ve test (%15) olmak üzere üç kümeye ayrılmıştır. ResNet101, EfficientNetb0, DenseNet201, ShuffleNet ve VGG16 gibi literatürde kullanılan ve farklı problemlerde başarılı sonuçlar sağlayan ESA mimarileri kullanılmıştır. İlk olarak yukarıda bahsedilen 3 farklı ESA modeli tibia plato kırığı tespiti için Ön ve Yan X-Işını görüntülerinin eğitim ve doğrulama veri setleri kullanılarak ayrı ayrı eğitilmiştir. Eğitilen modellerin Ön ve Yan X-Işını görüntüleri kullanılarak elde edilen tahmin sonuçları yumuşak oylama ile birleştirilmiş ve her bir mimari için nihayi karar elde edilmiştir. Tüm modeller için %80 ile %91 arasında tibia plato tespit doğruluğu elde edilmiştir. Elde edilen bu performans önerilen ESA temelli yöntemin tibia kırığı tespitinde umut verici olduğunu göstermektedir.

Anahtar Kelimeler: Tibia plato kırığı, yapay zeka, evrişimli sinir ağları, yumuşak oylama, karar destek sistemleri

DEVELOPMENT OF A DEEP LEARNING MODEL TO IDENTIFY TIBIA PLATEAU FRACTURES ON X-RAY IMAGES

ABSTRACT

The human body is composed of many types of bones. Rapid detection of fractures in these bones is crucial. A tibial plateau fracture refers to a fracture that occurs in the proximal tibia within the knee joint. Conventional X-ray imaging is frequently used for fracture diagnosis in orthopedic practice, offering the advantages of speed and simplicity. However, increasing medical demand and limited healthcare resources put pressure on clinicians, increasing the risk of misdiagnosis. Therefore, developing reliable ancillary methods for rapid fracture detection has become increasingly important. Artificial intelligence, and in particular convolutional neural networks (CNNs), are revolutionizing medical diagnostic processes by offering superior feature extraction and pattern recognition capabilities in image analysis. Our study aimed to develop a new soft-voting-based method for detecting tibial plateau fractures using CNN models. For this purpose, 317 anteroposterior and 317 lateral X-ray images with tibial plateau fractures and 339 normal X-ray images without any fracture findings are used. The dataset is randomly divided into three sets, namely training (70%), validation (15%), and testing (15%), to train, validate, and test the proposed CNN models. CNN architectures such as ResNet101, EfficientNetb0, DenseNet201, ShuffleNet, and VGG16, which are used in the literature and provide successful results in different problems, are used. First, the three different CNN models mentioned above are trained separately for tibial plateau fracture detection using training and validation datasets of frontal and lateral X-ray images. The prediction results obtained from the trained models using frontal and lateral X-ray images are combined using soft voting to obtain the final decision for each architecture. Tibial plateau detection accuracies between 80% and 91% are achieved for all models. This performance shows that the proposed CNN-based method is promising in the detection of tibia fractures.

Keywords: Tibial plateau fracture, artificial intelligence, convolutional neural networks, soft voting, decision support systems

1. INTRODUCTION

The human body is composed of various types of bones. The tibial plateau, located immediately below the femur, is the topmost portion of the tibia, the larger of the two lower leg bones. The term "tibial plateau fracture" (TPF) describes a fracture in the proximal tibia within the joint. This disorder is a serious articular injury that frequently results in considerable damage to the locomotor system, which limits joint functionality and produces worse than ideal clinical outcomes (Cho et al., 2017; Schulak and Gunn, 1997). The proximal tibia is vulnerable to several structural injuries, such as compression fractures, split fractures, bone deformities, or other damage brought on by severe traumatic loading, because it is a crucial location for force transmission in the lower leg (Hofmann et al., 2020; Xie et al., 2020).

Fractures at the top part of the tibia are usually complicated and frequently involve other knee components, including the meniscus, surrounding nerves, joint surface, and vascular tissues. Because treatment has a major impact on the patient's mobility and long-term quality of life, careful planning is necessary. The main diagnostic technique for TPFs is conventional X-ray imaging, which is prized for its ease of use, speed, and simplicity. Orthopedic doctors must accurately interpret X-ray images in order to ensure appropriate diagnosis and treatment. However, rising medical service demands and resource constraints can put pressure on clinicians, increasing the risk of missed or incorrect diagnoses, particularly with subtle fractures that may not be readily visible on X-rays (Liu et al., 2021). According to research, misinterpretation rates in radiography reach 40% due to severe, time-sensitive conditions and contributing factors such as recalcitrant patients and hasty decision-making. The serious health dangers associated with this circumstance highlight the necessity of trustworthy techniques for orthopedic professionals to quickly identify TPF (Guly, 2001; Pinto et al., 2016).

Computer science, mathematics, cybernetics, and determinism are all combined in the multidisciplinary field of artificial intelligence (AI). It is regarded as a 21st-century breakthrough technology that profoundly changes international operational frameworks. AI's main objective is to research human intelligence (HI) to create intelligent algorithms that let computers imitate and even surpass human cognitive capacities (Myers et al., 2020). AI, particularly in image analysis, has greatly evolved with the development of machine learning (ML), deep learning (DL), and convolutional neural networks (CNNs). Applications in computer vision, speech recognition, natural language processing, decision-making, and massive data analysis—particularly in the medical field—have resulted from artificial intelligence's adaptability (Wang et al., 2019). Research has demonstrated the efficacy of AI in imaging evaluations of orthopedic diseases such as scoliosis (Chen et al., 2021), osteoarthritis (Norman et al., 2019), and ligament injuries (Pedoia et al., 2019), as well as tumor identification (Wang et al., 2019).

Features like the femoral neck-shaft angle, intensity gradient, Gabor texture, and Markov Random Field texture are employed in one of the first investigations on fracture diagnosis. Support vector machines (SVM) and a Bayesian classifier are used, and combining various features and classification methods produced better outcomes than utilizing just one feature or classifier (Lim et al., 2004). Several image processing algorithms, such as corner and edge detection, are used in another related work to extract important and unique characteristics. A SVM classifier is then used to classify these features, resulting in a high degree of accuracy (Avinash Vishnu et al., 2015).

Our goal is to use state-of-the-art CNN models to create a novel soft-voting-based technique for tibial plateau fracture detection. For this, two distinct image datasets—anteroposterior (AP) and lateral (Lat)—that contained x-ray images with and without fractures are used.

2. MATERIALS AND METHOD

Within the scope of our study, it is aimed to present a new method based on soft voting for the detection of tibial plateau fractures from X-Ray images using Convolutional Neural Networks. The processing steps of the proposed method are given in Figure 2.1.

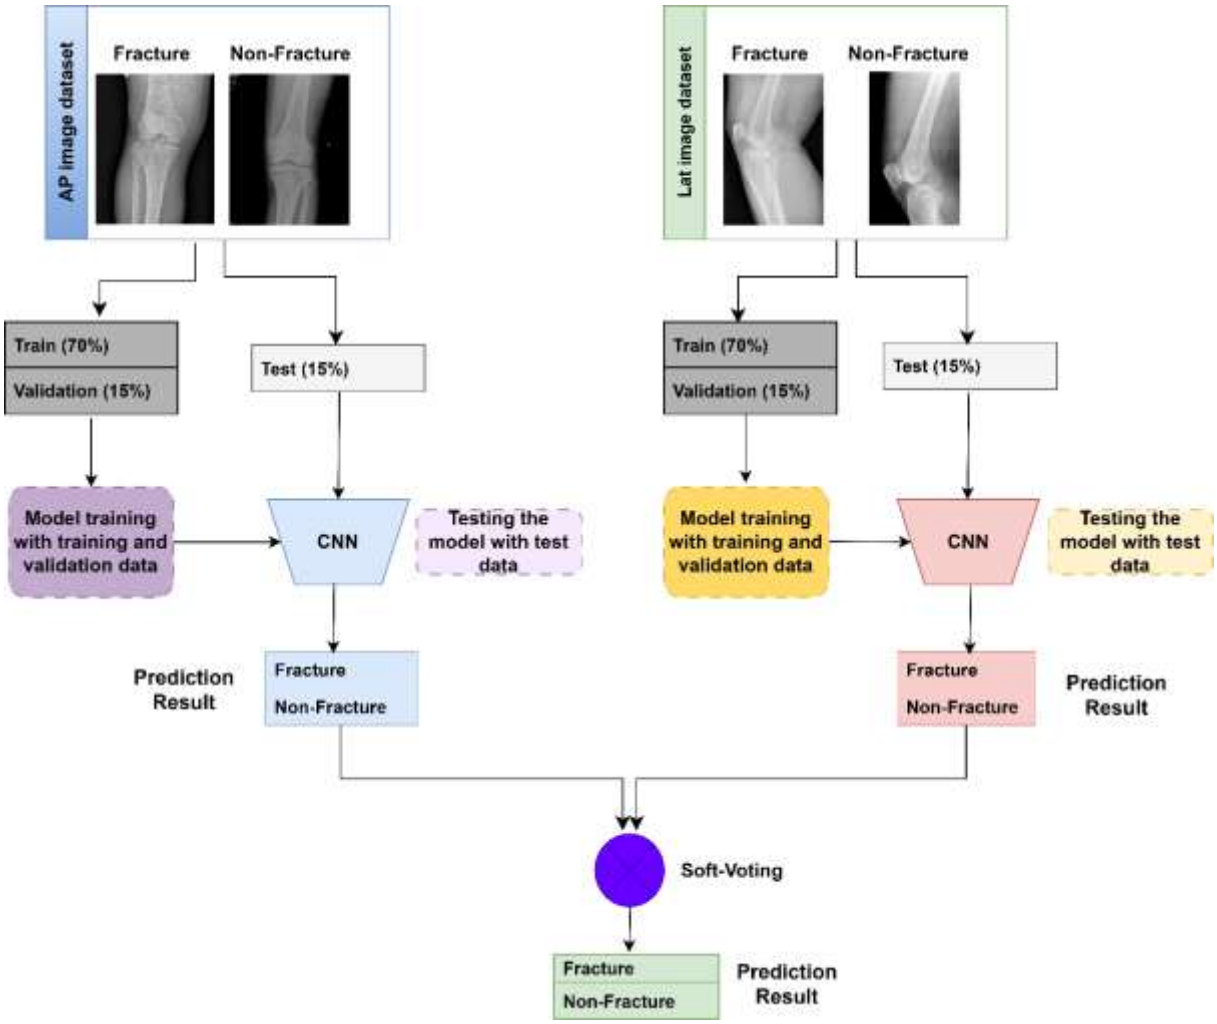

Figure 2.1. The overall framework of the proposed model.

2.1. Description of Datasets and Data Preprocessing

This study included adult patients (aged 18 years or older) diagnosed with tibial plateau fractures in the emergency department. These patients' X-Ray images are retrospectively reviewed, and their X-ray data are captured and recorded. 339 normal X-ray images without any fracture findings and 317 AP and 317 Lat X-ray images with tibial plateau fractures are used for the proposed study.

The input images are reduced to 224,224 pixels during the preprocessing stage in order to conform to the dimensions of the input layer of the applicable deep learning architecture. The complete dataset is then divided into three sets at random in order to train, validate, and test the suggested network. In this case, the training, validation, and test sets receive 70%, 15%, and 15% of the total data.

2.2. Tibial plateau fracture detection architecture

Convolutional neural network architectures, including ResNet101, EfficientNetb0, DenseNet201, ShuffleNet, and VGG16, which have been applied in the literature and have produced effective outcomes in a variety of tasks, are used in this study.

ResNet is an image recognition model that achieves notable improvements by using shortcut connections and deep residual learning. The residual block, which incorporates two convolutional layers and an activation function like ReLU, is its core component. By giving gradients an alternate and direct channel, these novel skip connections successfully address the vanishing gradient issue that is prevalent in deep networks. This increases accuracy, especially in classification, and speeds up training while lowering gradient issues. Additionally, ResNet makes an effort to comprehend the significance of acquired features by successfully lowering the weight of those that are thought to be unimportant for the task. However, because of dimensionality, adding additional skip connections may make the architecture more complex. Medical image processing often uses popular ResNet variants as ResNet18, ResNet50, and ResNet101. In our research, the ResNet101 architecture is employed (Salehi et al., 2023; Subasi, 2022). EfficientNet is an CNN model that leverages composite coefficients to reliably scale the depth, width, and resolution of the model. Initially, a base model, EfficientNetB0, containing convolutional and mobile reverse bottleneck (MB) convolutional blocks, was discovered via neural architecture search. In order to enhance its performance, this base model was subsequently scaled to larger models, ranging from EfficientNetB1 to B7. EfficientNetB0 is utilized in our investigation (Mahbod et al., 2025). ShuffleNet is an efficient CNN that seeks to achieve excellent accuracy on mobile devices with limited processing power while minimizing computational costs. It uses two key architectural innovations: pointwise group convolution (GConv), which reduces complexity by replacing traditional convolutions with discrete group convolutions, and the channel shuffle operation, which allows information to move across groups to increase feature capture. ShuffleNet outperforms lightweight approaches in terms of accuracy and computing complexity (Fang et al., 2022). DenseNet is an ESA-based model utilized in applications like medical image classification and retrieval. It enhances gradient flow by extending ResNet's skip connections through feedforward connections between all layers. The architecture includes dense blocks with multiple interconnected layers and transition layers for convolution and pooling. Notably, DenseNets maintain strong performance even at shallow depths, setting them apart from conventional network designs DenseNet201 is utilized in our investigation (Mahbod et al., 2025; Subasi, 2022). The design of the Visual Geometry Group (VGG) clearly demonstrates a trend toward deeper networks. These networks have been built with various layer configurations, from 11 to 19, but the most successful versions contain 16 or more layers. Performance is significantly improved by using smaller filter sizes throughout the network with greater depth. VGG uses a 2x2 pooling area and 3x3 convolutional filters. For convolution operations, stride and padding are set to 1. For pooling, stride=2 is used. After each pooling layer, the number of filters is often doubled; this is a notable aspect of the VGG architecture. VGG16 is utilized in our investigation (Mahbod et al., 2025; Subasi, 2022).

First, utilizing training and validation datasets of AP and Lat images, the distinct CNN models are trained independently for tibia plateau fracture detection. The test datasets are then used to evaluate the trained architectures' performance. We sought to improve classification performance using an ***ensemble learning*** approach in addition to the architectures' individual performance on the two image datasets. Combining multiple models to provide a final forecast that is more accurate and dependable than a single model is known as ensemble learning. This

method improves generalization to unknown data while utilizing the benefits of many models. A better combination of performance, efficiency, and memory can only be attained by selecting the finest CNN models and figuring out how to combine them. The literature discusses three ensemble learning techniques: weighted voting, ***soft voting***, and hard voting. ***Soft voting***: The predicted class probabilities are used in place of the class labels derived from each model (label 0 for the non-fracture image and label 1 for the fracture image). To choose the class with the highest probability, the ensemble learning approach averages or adds the probabilities. This approach often yields superior results by accounting for each model's degree of confidence in its predictions. In our study, individual results obtained from AP and Lat images using CNN architectures are used to obtain a general result with the soft voting approach.

2.3 Performance Evaluation

The performance of the trained CNN models is evaluated using a number of parameters, including accuracy (ACC), sensitivity (SEN), specificity (SPE), precision (PRE), and the Area Under the Receiver Operating Characteristic Curve (AUC-ROC).

$$SEN = \frac{TP}{TP + FN}$$
$$SPE = \frac{TN}{TN + FP}$$
$$PPV = \frac{TP}{TP + FP} \quad (1)$$
$$ACC = \frac{TP + TN}{TP + TN + FP + FN}$$

These metrics are derived from the confusion matrix's four components: True Positive (TP): Accurately classified fracture samples. True Negatives (TN) are Non-Fracture samples that have been correctly identified. False Positive (FP): When fracture is mistakenly diagnosed in Non-Fracture samples. False Negative (FN): Fracture samples that are incorrectly classified as Non-Fracture (Cura et al., 2023).

3. RESULTS AND DISCUSSION

This paper suggests an ensemble approach based on soft voting for the identification of tibial plateau fractures using CNNs. A dataset of 317 pairs of tibial plateau fractures and 339 normal X-ray images is presented in the study. Training (70%), Validation (15%), and Test (15%) sets are created by resizing the images to 224x224 pixels. Both AP and Lat image datasets are used to train five CNN architectures: ResNet101, EfficientNetb0, DenseNet201, ShuffleNet, and VGG16. Among the innovations is an ensemble approach that combines forecasts from these CNNs using soft-voting. By evaluating the model's performance using criteria like ACC, SEN, SPE, PPV, and AUC-ROC, a strong foundation for identifying tibial plateau fractures utilizing cutting-edge deep learning techniques is established.

Table 3.1. Classification performance using several CNN techniques, image datasets ans Soft-Voting.

		Validation					Test				
		ACC	SEN	SPE	PPV	FDR	ACC	SEN	SPE	PPV	FDR
ResNet101	AP	90.80	87.20	94.10	93.20	6.80	85.90	89.60	82.40	82.70	17.30
	Lat	89.80	87.20	92.20	81.10	8.90	84.80	93.80	76.50	78.90	21.10
	Soft-Voting	93.90	89.40	98.00	97.70	2.30	***90.90***	***91.70***	***90.20***	***89.80***	***10.20***
EfficientNetb0	AP	88.80	89.40	88.20	87.50	12.50	81.80	85.40	78.40	78.80	21.20
	Lat	88.80	78.70	98.00	97.40	2.60	82.80	77.10	88.20	86.00	14.00
	Soft-Voting	89.80	85.10	94.10	93.00	7.00	86.90	85.40	88.20	87.20	12.80
DenseNet201	AP	90.80	87.20	94.10	93.20	6.80	86.90	85.40	88.20	87.20	12.80
	Lat	86.70	83.00	90.20	88.60	11.40	82.80	85.40	80.40	80.40	19.60
	Soft-Voting	94.90	89.40	100.00	100.00	0.00	86.90	85.40	88.20	87.20	12.80
ShuffleNet	AP	90.80	89.40	92.20	91.30	8.70	85.90	87.50	84.30	84.00	16.00
	Lat	86.70	83.00	90.20	88.60	11.40	80.80	83.30	78.40	78.40	21.60
	Soft-Voting	89.80	85.10	94.10	93.00	7.00	88.90	91.70	86.30	86.30	13.70
VGG16	AP	89.80	91.50	88.20	97.80	12.20	81.80	87.50	76.50	77.80	22.20
	Lat	90.80	83.00	98.00	97.50	2.50	89.90	89.60	90.20	89.60	10.40
	Soft-Voting	91.80	89.40	94.10	93.30	6.70	87.90	91.70	84.30	84.60	15.40

The classification performance of five distinct CNN architectures (ResNet101, EfficientNetb0, DenseNet201, ShuffleNet, and VGG16) for identifying tibial plateau fractures are shown in Table 3.1. The final Soft-Voting ensemble from both the Validation and Test datasets, as well as images from AP (Anteroposterior) and Lat (Lateral), are displayed. The Soft-Voting ensemble consistently and significantly improved performance across almost all models and metrics, particularly on the independent test dataset. This is the most important finding from the table. Test set performance is used to assess model generalization, and soft-voting results highlight important discoveries. ResNet101 performs well in recognizing both fracture and non-fracture cases, achieving the greatest ACC (90.90%) and SPE (90.20%), as well as high SEN (91.70%). The efficacy of the ensemble strategy is validated by the Soft-Voting approach, which likewise consistently increases test ACC when compared to individual model results. Lat models, including ResNet101 Lat (93.80% SEN) and VGG16 Lat (89.60% SEN), outperformed AP models in the test set, suggesting that lateral pictures contain crucial information for fracture diagnosis. With VGG16 AP hitting 22.20%, the FDR İs noticeably high. ResNet101's decrease from 17.30%/21.10% to 10.20% is an example of how Soft-Voting decreased test FDR for all models. When moving from the validation to the test set, performance decreased, underscoring the difficulties with unknown data. The study demonstrates that the soft-voting ensemble learning strategy is successful in identifying tibial plateau fractures, with ResNet101 emerging as the best model with a test ACC of 90.90% and the best balance between SPE and SEN.

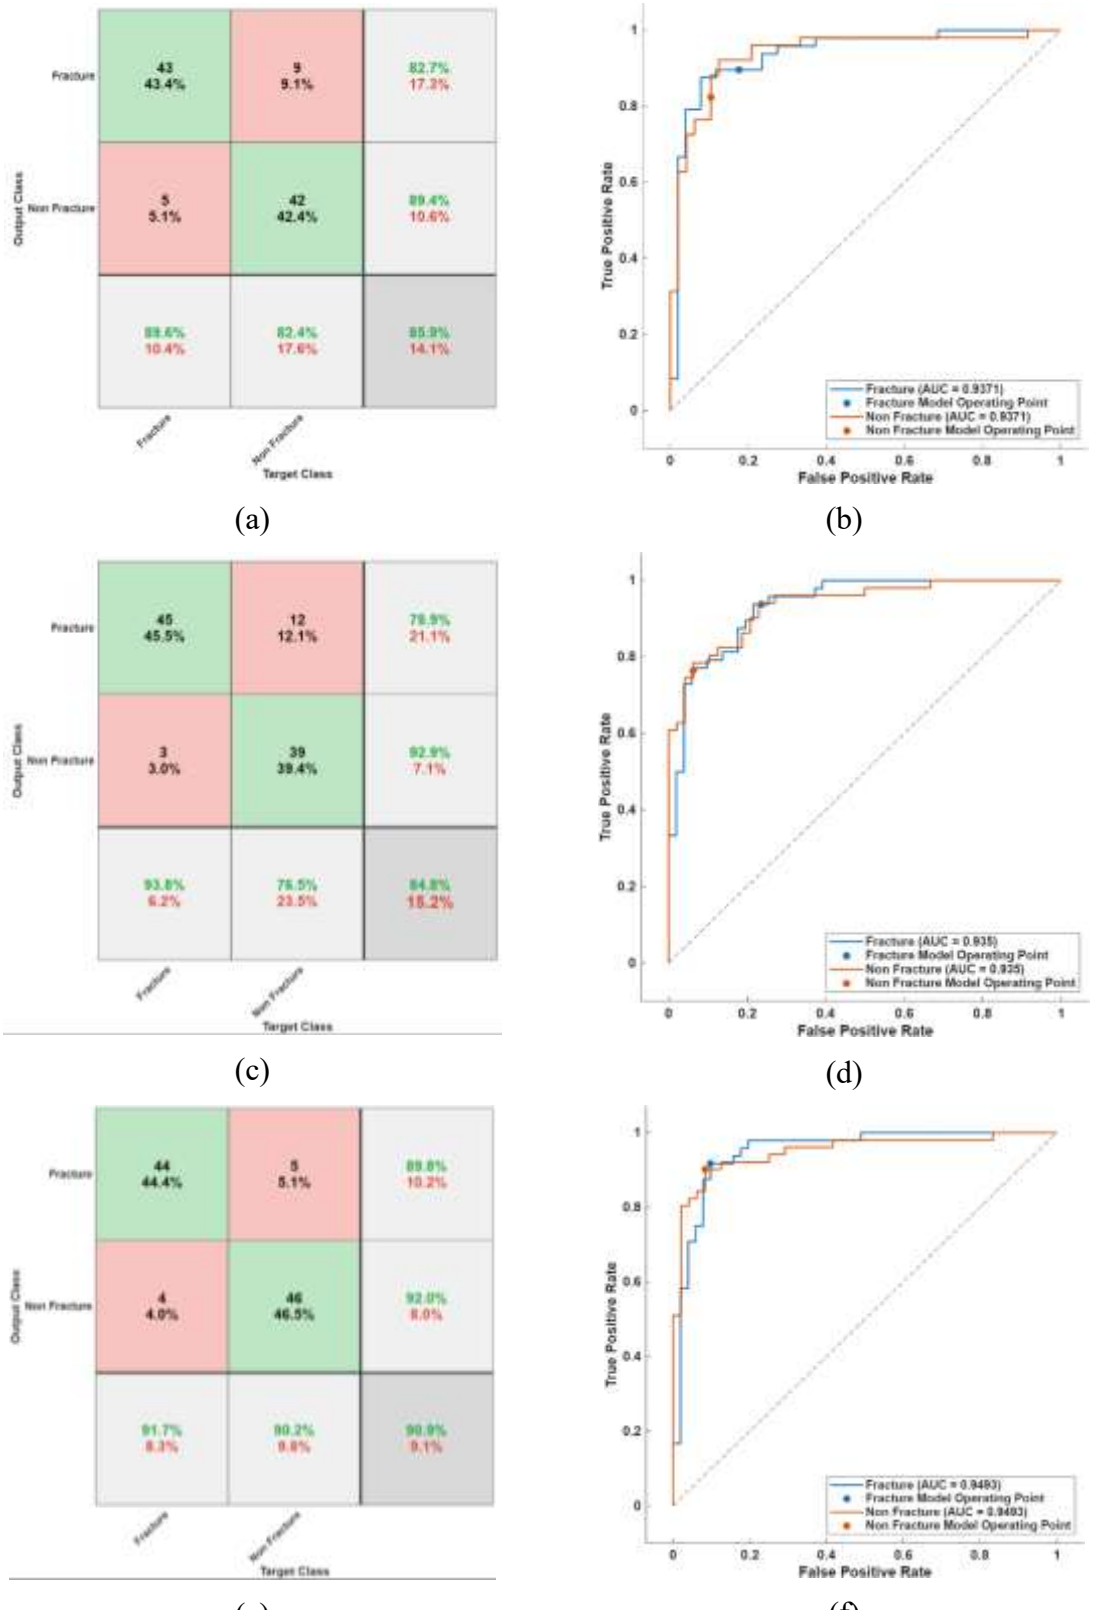

Figure 3.1. For test case of ResNet101: a) Confusion Matrix, b) ROC curve, and AUC value obtained for the App image dataset; c) Confusion Matrix, d) ROC curve, and AUC value obtained for Lat image dataset; e) Confusion Matrix, f) ROC curve, and AUC value obtained for the Soft-Voting

The ResNet101 architecture's comprehensive classification performance on the test dataset for AP image dataset (a, b), Lat image dataset (c, d), and the Soft-Voting (e, f) is shown in Figure 3.1. The Confusion Matrices (a, c, e) and Receiver Operating Characteristic (ROC) Curves with their corresponding Area Under the Curve (AUC) values (b, d, f) are the main subjects of the evaluation. The Soft-Voting model performs the best overall for fracture diagnosis, according to important findings from the study of confusion matrices. In comparison to the other models, it obtains the greatest True Positive rate (91.7%) and True Negative rate (90.2%), with a balanced decrease in False Positives. The Soft-Voting model has the highest AUC (0.9493), indicating superior discrimination ability, as shown by the ROC curve and AUC analysis. With AUCs above 0.930, all models perform well and show good classification abilities. Overall, the Soft-Voting model significantly enhances the predictive quality of the ResNet101 architecture, making it the most clinically dependable choice among the assessed configurations.

3. CONCLUSION

In order to automatically diagnose tibial plateau fractures in X-ray images, this study successfully designed and assessed a novel soft-voting-based ensemble method employing CNNs. Developing trustworthy ancillary techniques for quick fracture identification is becoming more crucial because to the demands on medical professionals and the possibility of incorrect diagnosis using traditional X-ray interpretation. Five well-known CNN architectures—ResNet101, EfficientNetb0, DenseNet201, ShuffleNet, and VGG16—are used in the study. Each CNN architecture is trained separately on both AP and Lat X-ray images. The effectiveness of integrating predictions is confirmed by the Soft-Voting ensemble technique, which consistently and considerably improved classification performance across nearly all models and metrics on the independent test dataset. With the greatest test ACC of 90.90% and the highest Specificity of 90.20%, the ResNet101 Soft-Voting ensemble proved to be the best overall model for generalized TPF identification. By reducing both missed fractures and false alarms, this model showed the most balanced prediction quality. In comparison to the individual AP (AUC 0.9371) and Lat (AUC 0.935) models, the Soft-Voting ensemble for ResNet101 likewise produced the highest Area Under the Curve (AUC) of 0.9493, demonstrating higher discrimination abilities between fracture and non-fracture cases. Because Lat models frequently obtained higher sensitivity than AP models, analysis of individual models revealed that Lat view images contain information essential for fracture diagnosis.

The Soft-Voting method effectively combined the advantages of both points of view. The suggested CNN-based soft-voting method achieved tibial plateau detection accuracies between 80% and 91% for all models, suggesting that this method is promising in the detection of tibia fractures and builds a strong foundation for a dependable decision support system in orthopedic practice. In conclusion, the suggested soft-voting ensemble approach is a reliable and promising supplementary tool for orthopedic practitioners, providing a significant increase in the precision and dependability of TPF diagnosis from X-ray pictures by optimizing deep learning.

EEG'DEN ŞİZOFRENİ TESPİTİ: DERİN ÖĞRENME VE BEYİN BAĞLANTISI YAKLAŞIMI

Özlem KARABİBER CURA

Izmir Katip Celebi University, Faculty of Engineering and Architecture, Department of Biomedical Engineering

ORCID: 0000-0001-8650-1137

ÖZET

Şizofreni, sıklıkla beyin bağlantılarındaki değişikliklerle ilişkili olan, biliş, algı ve davranış bozukluklarıyla karakterize çok yönlü bir nöropsikiyatrik durumdur. Kapsamlı araştırmalara rağmen, temel nörofizyolojik mekanizmalar hala tam olarak anlaşılamamıştır. Elektrofizyolojik sinyal işleme ve nörogörüntüleme alanındaki son gelişmeler, şizofreninin ağ tabanlı bir şekilde incelenmesini kolaylaştırarak yaygın beyin işlev bozukluklarına dair içgörüler sağlamıştır. Bu çalışma, şizofreniyle ilişkili beyin ağı işlev bozukluklarını keşfetmek için derin öğrenmeyle birlikte EEG tabanlı işlevsel bağlantı analizini kullanmaktadır. Şizofreni hastaları ve sağlıklı kontroller arasındaki işlevsel bağlantı farklılıklarını analiz etmek için iki adet kamuya açık EEG veri setini kullanılmıştır. EEG kayıtları 10 saniyelik aralıklarla segmentlere ayrılmış ve her segment için yedi bağlantı parametresi hesaplanmıştır: çapraz güç spektral yoğunluğu, büyüklüğün karesi alınmış koherans, kovaryans, korelasyon katsayısı, korentropi katsayısı, koherentropi katsayısı ve faz kilitleme değeri. Çıkarılan bu bağlantı özellikleri, N×N boyutunda bağlantı matrisleri oluşturmak için kullanılmıştır; burada N, EEG kanal sayısıdır. Elektrot çiftleri arasındaki işlevsel bağlantı, ilgili özelliğe göre bu matrislerle temsil edilmektedir. Her bağlantı matrisi, derin öğrenme sınıflandırma amaçları için 224×224 piksellik bir görüntüye dönüştürülmüştür. Araştırmamızda, elde edilen bağlantı tabanlı görüntülerde dört farklı evrişimli sinir ağı mimarisinin (ResNet18, ResNet50, DenseNet201 ve ShuffleNet) sınıflandırma performansını karşılaştırmalı olarak değerlendirdik. Her iki veri seti üzerinde yürüttüğümüz deneysel araştırmaya göre, DenseNet201 ve ShuffleNet modelleri, çeşitli bağlantı değişkenleriyle birleştirildiğinde şizofreni tanısında büyük sınıflandırma başarısı göstermiştir. Bu yaklaşım, derin öğrenmenin görüntü işlemedeki güçlü yönlerinden yararlanmış ve şizofreniyle bağlantılı EEG bağlantı modellerinin etkili bir şekilde sınıflandırılmasını sağlamıştır.

SCHIZOPHRENIA DETECTION FROM EEG: A DEEP LEARNING AND BRAIN CONNECTIVITY APPROACH

ABSTRACT

Schizophrenia is a multifaceted neuropsychiatric condition marked by impairments in cognition, perception, and behavior, frequently associated with altered brain connections. Despite comprehensive research, the fundamental neurophysiological mechanisms remain incompletely understood. Recent breakthroughs in electrophysiological signal processing and neuroimaging have facilitated a network-based investigation of schizophrenia, yielding insights into extensive brain dysfunctions. This study employs EEG-based functional connectivity analysis, combined with deep learning, to investigate brain network dysfunctions associated with schizophrenia. It employs two publicly available EEG datasets to analyze functional connectivity differences between patients with schizophrenia and healthy controls. EEG recordings are segmented into 10-second intervals, and seven connectivity parameters are computed for each segment: cross power spectral density, magnitude squared coherence, covariance, correlation coefficient, correntropy coefficient, coherentropy coefficient, and phase locking value. These extracted connectivity properties are used to create connectivity matrices of size N×N, where N is the number of EEG channels. These matrices represent the functional connectivity between electrode pairs according to the corresponding feature. Each connectivity matrix is transformed into a 224×224 pixel image for deep learning classification purposes. In our research, we comparatively evaluated the classification performance of four different convolutional neural network architectures (ResNet18, ResNet50, DenseNet201, and ShuffleNet) in the resulting connectivity-based images. DenseNet201 and ShuffleNet models, when combined with a variety of connectivity variables, demonstrated great classification success in schizophrenia identification, according to our experimental research conducted on both datasets. This approach takes advantage of deep learning's strengths in image processing and allows for the effective classification of EEG connectivity patterns linked with schizophrenia.

Keywords: Schizophrenia, Electroencephalography (EEG), Functional Connectivity, Deep Learning, Neurophysiological Biomarkers, Signal Processing

1. INTRODUCTION

Schizophrenia (SCH) is a chronic illness that causes delusions and hallucinations as well as a gradual decline in emotional behavior and cognitive function (Hassan, et al., 2023; Puri et al., 2025; Puri et al., 2026). Severe cognitive degeneration affected 25 million people globally in 2023, with those in their early twenties being particularly vulnerable. Long-term, costly medication strains families and healthcare systems, while misdiagnosis and treatment delays increase mortality (Puri et al., 2025; Puri et al., 2026). A dependable, affordable, and automated detection system is required (Hassan, et al., 2023; Puri et al., 2025; Puri et al., 2026).

The fundamental neurophysiological mechanisms of schizophrenia are still poorly understood despite decades of research. However, new developments in electrophysiological signal processing and neuroimaging have made it possible for researchers to study schizophrenia from a network-based approach, providing fresh perspectives on the disorder's altered brain dynamics. A popular non-invasive and temporally accurate technique for evaluating the electrical activity of the brain is electroencephalography (EEG). EEG is beneficial for investigating brain dynamics in mental illnesses like schizophrenia because of its great temporal resolution and affordability (Agarwal, and Singhal, 2023). Functional connectivity, which offers a way to evaluate synchronization and statistical interdependence across geographically diverse brain regions, has become a crucial framework in EEG research in recent years (Friston, 2011). The degree of collaboration between different brain regions is determined by functional connectivity, which makes it easier to comprehend the alterations in connectivity seen in conditions like schizophrenia. Schizophrenia patients' resting-state EEG investigations have shown decreased alpha activity in the frontal cortex along with elevations in delta, theta, and beta activity. This illustrates "hypofrontality," a condition that shows how the illness affects cognitive abilities (Ingvar, and Franzén, 1974; Ragland et al., 2007). Several signal processing methods, such as coherence, cross-power spectral density (CPSD), phase-locking value (PLV), correlation, covariance, correntropy, and cohentropy, can be used to evaluate functional connectivity in EEG data (Sarwer et al., 2025; Stam, and Reijneveld, 2007). These techniques aid in the discovery of possible biomarkers and advance knowledge of the altered connection patterns in the brain networks of people with schizophrenia. Patients with schizophrenia have often been found to exhibit altered patterns of functional connectivity, indicating aberrant integration of neural information across distant brain networks (Pettersson-Yeo et al., 20211). The disorder's cognitive and perceptual deficits are assumed to be caused by a disruption in large-scale brain synchronization, which is reflected in these abnormalities (Rubinov, and Sporns, 2010).

This research is focused on identifying changes in functional brain connectivity associated with schizophrenia symptoms. We will achieve this by analyzing EEG data using a novel framework that integrates signal processing, functional connectivity analysis, and deep learning analysis. The ultimate goal is to offer fresh insights into brain network dysfunctions and establish a critical foundation for developing neurophysiological biomarkers.

2. MATERIALS AND METHOD

Figure 2.1 illustrates the whole approach, which uses deep learning based on Electroencephalography (EEG) connectivity properties to classify SCH and CS. To eliminate artifacts and isolate pertinent times, the procedure starts with pre-processing operations including filtering and segmentation (e.g., into 10-second segments). To measure the functional relationships between different parts of the brain, several connectivity parameters are taken from EEG channels. These features are arranged into NxN connectivity matrices, which are then transformed into heatmap images to be fed into a pre-trained CNN architecture. Through

deep learning, the CNN improves diagnostic support by identifying high-level spatial patterns in these images and producing a binary diagnostic output of CS or SCH.

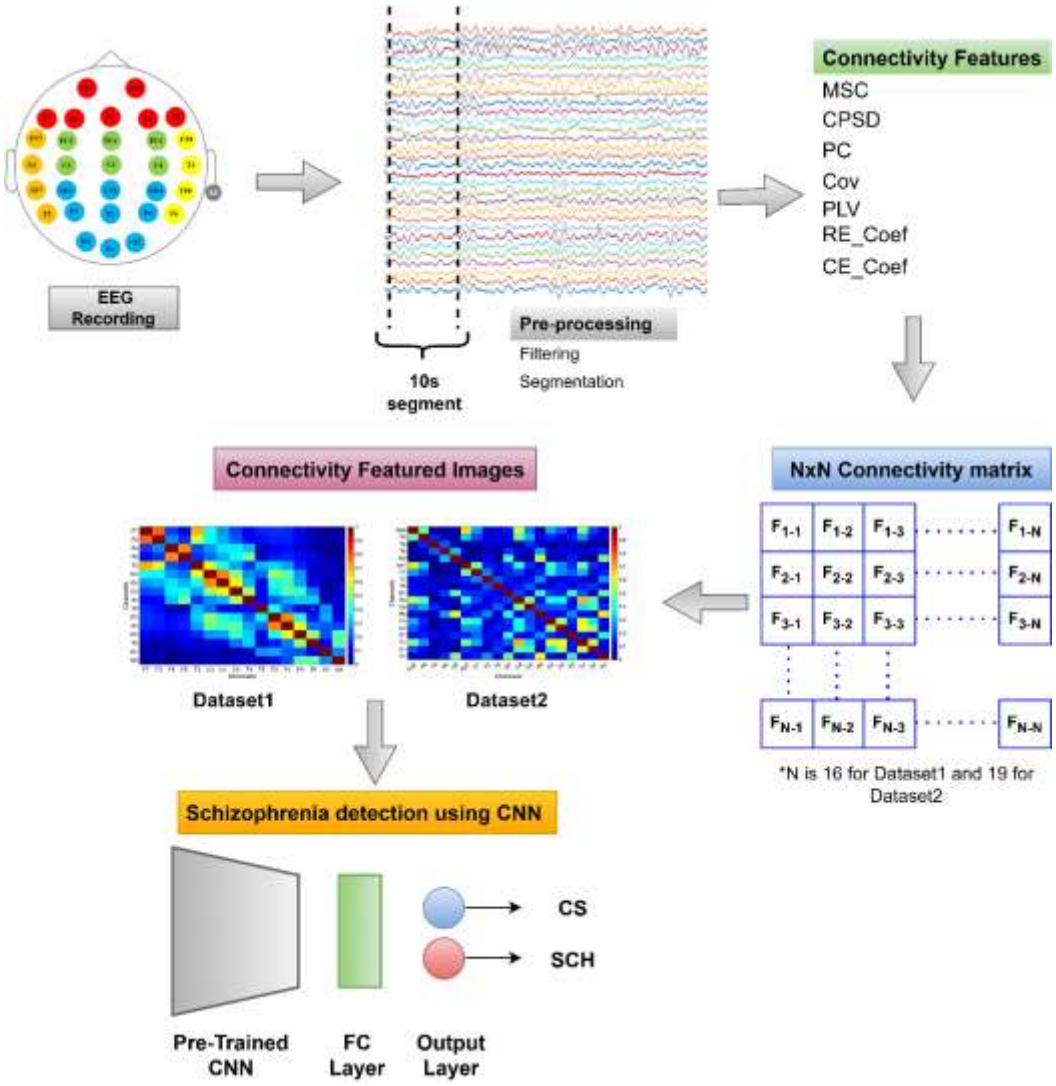

Figure 2.1. Block diagram of the suggested methodology

2.1. Description of EEG Datasets

This study examined functional connectivity differences between people with schizophrenia and healthy controls using two publicly available EEG datasets.

2.1.1 Schizophrenia EEG Datasets-1 (Dataset 1)

This study's initial dataset came from M.V. Lomonosov Moscow State University's Laboratory for Neurophysiology and Neuro-Computer Interfaces. It includes EEG recordings taken during resting-state conditions from 84 teenagers, ages 11 to 14. 39 healthy controls (CS) and 45 people exhibiting symptoms of schizophrenia (SCH) were the two groups of volunteers. Doctors at the Mental Health Research Center (MHRC) verified diagnoses for the schizophrenia group using the ICD-10 categorization (codes F20, F21, and F25) [12]. Crucially, none of the participants had been treated before the EEG was recorded. Over the course of a minute, each EEG sample was collected at a sampling rate of 128 Hz, yielding 7680 data points per channel. 16 electrodes spread over five different brain regions—frontal (F), central (C), parietal (P), temporal (T), and occipital (O)—were used to record the EEG data.

F7, F3, F4, F8, T3, C3, Cz, C4, T4, T5, P3, Pz, P4, T6, O1, and O2 were the precise electrode placements. The signals were denoised to remove artifacts before being added to the dataset. The data is organized as a 16 × 7680 matrix for each participant.

2.1.1 Schizophrenia EEG Datasets-2 (Dataset 2)

The second dataset came from research done at the Polish Institute of Psychiatry and Neurology in Warsaw. It contains EEG recordings from 28 persons in total, including 14 patients with paranoid schizophrenia (SCH) (ICD-10 code F20.0) and 14 age-and gender-matched healthy control subjects (CS). Before the EEG recordings, the patients had completed a minimum of seven days of drug washout. Each participant provided written informed consent, and the Institute's Ethics Committee approved the study. The typical worldwide 10–20 system with 19 electrodes (Fp1, Fp2, F7, F3, Fz, F4, F8, T3, C3, Cz, C4, T4, T5, P3, Pz, P4, T6, O1, O2) was used to capture EEG data during a 15-minute eyes-closed resting-state session at a sampling frequency of 250 Hz. At FCz, the reference electrode was positioned.

2.2. EEG Pre-processing and Segmentation

We carefully clean the EEG data to guarantee accuracy and eliminate unnecessary signals during the pre-processing phase. First, 10-second non-overlapping windows are created from Datasets 1 (16 channels, 128 Hz) and 2 (19 channels, 250 Hz). Each channel is then subjected to a second-order Butterworth band-pass filter (0.5–45 Hz) to eliminate high-frequency noise and low-frequency drifts. Each subject underwent separate filtering and segmentation, and the processed segments are stored for later examination.

2.3. Featured Image Generation based on EEG Connectivity

Three steps are involved in the development of the EEG connectivity-based featured image: calculating the connectivity feature, creating a NxN connectivity matrix, and creating the connectivity-based featured image.

Seven connectivity features—magnitude square coherence (MSC), cross-power spectral density (CPSD), correlation coefficient (PC), covariance (Cov), cohentropy coefficient (CE-Coef), correntropy coefficient (RE-Coef), and phase locking value (PLV)—are computed in this study using various combinations of EEG channel pairs. While CPSD examines cross-correlation in time series for covariance distribution across frequencies (Li et al., 2020) , MSC calculates the relationship between two brain signal frequencies to forecast complicated signals using linear models (Malekpour et al., 2018). By quantifying linear correlation between data, PC uses the covariance matrix to reveal changes in brain activity (Dauwels et al., 2010). By normalizing centered cross-correntropy via mean subtraction and standard deviation division, the RE-Coef finds higher-order statistical or nonlinear correlations. Furthermore, in the frequency domain, the CE-Coef functions as a nonlinear coherence function extension (Gunduz, and Principe, 2009; Cura et al., 2023). Additionally, the synchronization of two signals' phases over time is reflected in the PLV, a connection metric. When phase discrepancies are stable, a PLV value close to one denotes good synchronization, whereas a number near 0 suggests independence and random phase variations (Adams et al., 2020).

The seven connectivity-based parameters described above are computed for every pair of EEG channels in the two schizophrenia datasets (Dataset 1 and Dataset 2). The calculated features are then normalized using the maximum-minimum normalization method. For Dataset 1, the normalized connectivity feature values derived from the subject's 16 EEG channel pairings are organized in a 16x16 connectivity matrix. Similarly, for Dataset 2, normalized connectivity feature values from the subject's 19 EEG channel pairings are organized in a 19x19

connectivity matrix. The connectivity matrix is then converted to a 224x224 resolution using nearest neighbor interpolation to preserve the relative proportions of the data points, offer consistent formatting, and improve visual clarity. Finally, the connectivity data is visualized as 224x224 pixel featured images using a "jet" colormap. These images are stored in PNG format and arranged into folders based on feature types and class labels (SCH or SC). Across the two datasets, the total image count for each feature type generated is (i) for Dataset 1: 234 CS images and 270 SCH images, and (ii) for Dataset 2: 1,299 CS images and 1,579 SCH images. All processes are carried out using MATLAB 2025a. Figure 2.2 (b,e) and (c,f) provide examples of images for a control participant and an SCH patient. MSC is used to demonstrate great coherence in red and low coherence in dark blue.

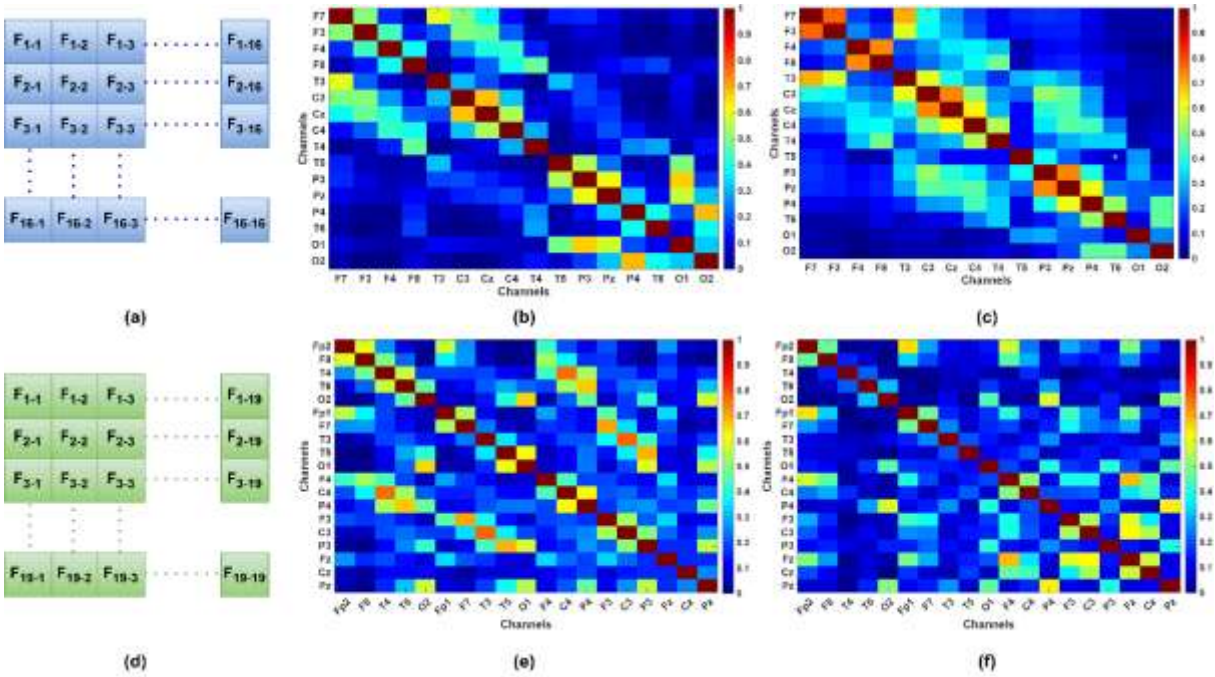

Figure 2.2. Featured image generation steps for MSC feature: (a) Brain connectivity matrix, connectivity based featured image of (b) CS (c) SCH of Dataset1; (d) Brain connectivity matrix, connectivity-based featured image of (e) CS, (f) SCH of Dataset2.

2.4 CNN-Based Classification Process

CNN-based models frequently outperform conventional hand-crafted features in classification tasks due to their great effectiveness. They are a very attractive option for the feature extraction phase of a classification pipeline due to their exceptional performance. We use a number of well-known deep CNN architectures in this study, which are well-known in artificial intelligence (AI) for their unique categorization skills. Four pre-trained CNN models—ResNet18, ResNet50, DenseNet201, and ShuffleNet—are used in this work to categorize connectivity-based featured images of SCH and CS. ResNet18 and ResNet50 are two well-known ResNet architectures. Faster training without compromising performance is the goal of ResNet18. It has an FC layer, two pooling layers, five residual blocks, and a 7x7 convolutional layer. ResNet50 is a 50-layer residual CNN that uses shortcut connections to address the backpropagation vanishing gradient issue (Shaheema, and Muppalaneni, 2025). A CNN with 201 layers, DenseNet201 is distinguished by dense connection, which enables each layer to be directly connected to every layer that came before it inside the same dense block. By using fewer parameters than conventional CNNs, this architecture ensures parameter efficiency, encourages feature reuse, and reduces the vanishing gradient issue. The design consists of

transition layers that incorporate batch normalization, 1x1 convolution for feature map reduction, and 2x2 average pooling for down-sampling, as well as dense blocks that apply the dense connectivity pattern (Yu, et al., 2019). ShuffleNet is an effective CNN that aims to minimize computational expenses while achieving high accuracy on mobile devices with low processing capacity. It makes use of two major architectural innovations: the channel shuffle operation, which permits information flow across groups to improve feature capture, and pointwise group convolution (GConv), which substitutes distinct group convolutions for conventional convolutions to reduce complexity. When compared to lightweight designs, ShuffleNet performs better, providing greater accuracy with less computational complexity (Fang, et al., 2022).

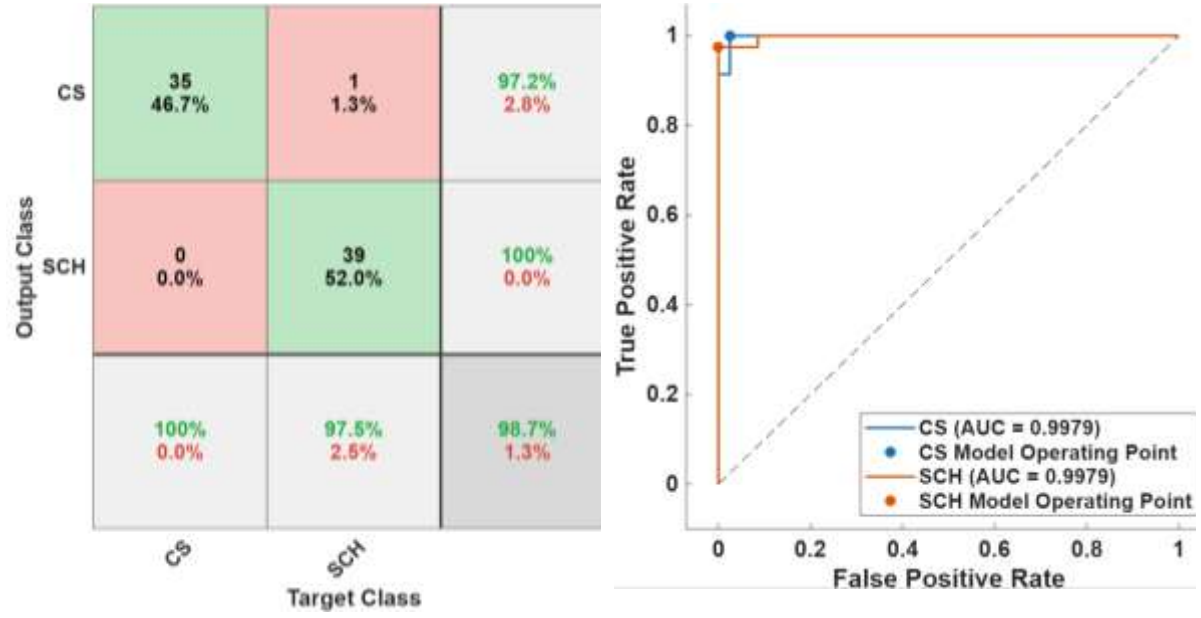
2.5 Performance Evaluation

To evaluate CNN's performance, the connectivity-based featured image datasets are divided into three subsets: training (70%), validation (15%), and testing (15%). Several evaluation criteria, such as accuracy (ACC), sensitivity (SEN), specificity (SPE), precision (PRE), and the Area Under the Receiver Operating Characteristic Curve (AUC-ROC), are employed to assess the performance of the trained CNN models.

$$SEN = \frac{TP}{TP + FN}$$
$$SPE = \frac{TN}{TN + FP}$$
$$PRE = \frac{TP}{TP + FP} \quad (1)$$
$$ACC = \frac{TP + TN}{TP + TN + FP + FN}$$

These metrics are obtained from the four components of the confusion matrix: True Positive (TP): Samples of schizophrenia that are correctly classified. Correctly identified control samples are known as True Negatives (TN). False Positive (FP): Inaccurate diagnosis of schizophrenia in control samples. False Negative (FN): Samples with schizophrenia that are mistakenly categorized as controls (Cura et al., 2023).

3. RESULTS AND DISCUSSION



In this work, we use CNN and connectivity-based featured pictures to propose a classification method for CS and SCH patients based on their EEG signals. Seven different connectivity features—MSC, CPSD, PC, Cov, PLV, RE_Coef, and CE_Coef—are first calculated as part of our techniques. The RGB images that serve as the connectivity-based featured images are created from these computed features. To take advantage of CNN models' shown ability to distinguish SCH from CS, these connectivity-based featured images are fed into four different CNN models (ResNet18, ResNet50, DenseNet201, and ShuffleNet).

Using a variety of connectivity-based featured images (such as MSC, CPSD, PC, Covv, RE_Coef, CE_Coef, and PLV), Table 1 provides a thorough performance evaluation of four different CNN architectures—ResNet18, ResNet50, DenseNet201, and ShuffleNet—on the classification problem for Dataset 1. Perfect validation scores (ACC: 100%, SEN: 100%, SPE: 100%, PRE: 100%) and near-perfect test scores (ACC: 98.70%, SEN: 97.50%, SPE: 100%, PRE: 100%) are obtained by the ShuffleNet architecture with the RE_Coef feature set. With no false positives, the model exhibits outstanding generalization. While ResNet18 + RE_Coef and ResNet50 + MSC exhibit strong test ACC (94.70% and 98.70%, respectively), ResNet18

+ MSC also records perfect test results, raising concerns about possible data leaking among classic deep models. DenseNet201, on the other hand, performs poorly with a maximum test ACC of 84.00% and limited sensitivity in some situations. Deeper models like ResNet50 and DenseNet201 are matched or outperformed by the ShuffleNet architecture. It is the most computationally efficient choice for situations with limited resources, with a high non-perfect test ACC of 98.70%. On the test set, DenseNet201, on the other hand, frequently exhibits overfitting and insufficient feature use. Overfitting in some models is indicated by instances of notable declines in validation scores on the test set. DenseNet201 + PLV, for instance, has a validation ACC of 44.70%, which falls to 45.30% test ACC, and a validation SEN of 2.40% as opposed to 2.50% test SEN, indicating little learning. The top-performing models, ShuffleNet + RE_Coef and ResNet50 + MSC, on the other hand, show very small dips, suggesting outstanding generalization. In particular, ShuffleNet with RE_Coef achieves a test ACC of 98.70% with flawless precision and specificity, emphasizing the significance of the RE_Coef for upcoming model development.

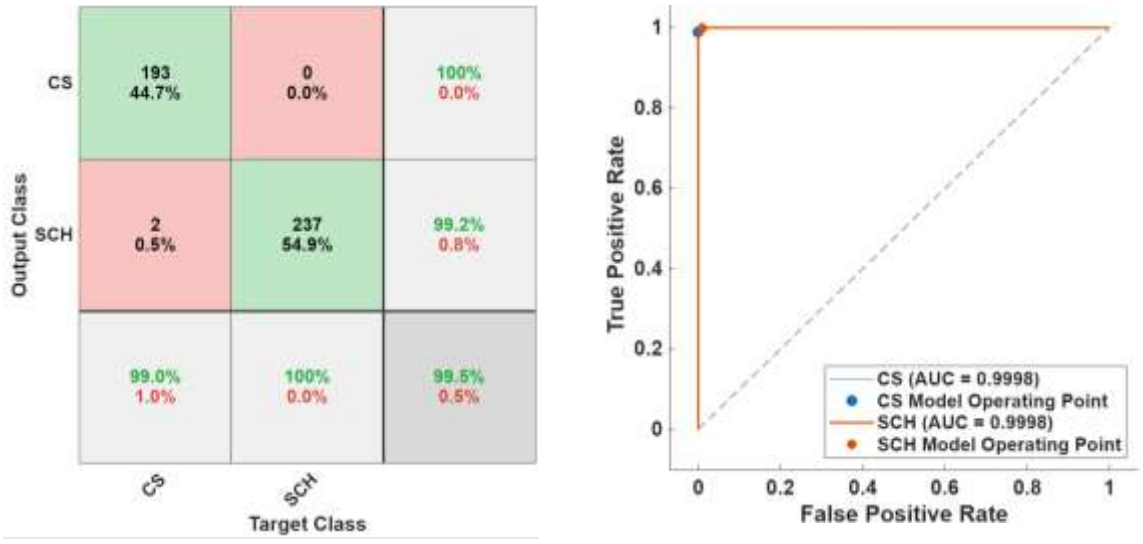
a) **b)**

Figure 3.1. a) Confusion Matrix, b) ROC curve, and AUC value obtained for the RE_Coef connectivity-based featured image test set of the ShuffleNet method for Dataset1



The test classification results for the ShuffleNet technique using the RE_Coef connectivity featured image set are shown in Figure 3.1, which validates the remarkable performance of the method as shown in previous tables. There are two parts to it: a) Confusion Matrix, b) Receiver Operating Characteristic (ROC) Curve with matching Area Under the Curve (AUC) value. The ShuffleNet architecture, integrated with the RE_Coef connectivity feature set, demonstrates exceptional performance in classification tasks, achieving approximately 98.7% accuracy and zero False Negatives, critical for medical diagnosis. The model's outstanding discriminatory capacity is further demonstrated by the ROC Curve and AUC of approximately 0.998, underscoring its potential as a valuable diagnostic support tool in clinical settings.

Table 3.2 presents the performance of four deep learning architectures on Dataset 2, with an emphasis on the Validation and Test set metrics to identify the optimal generalization capabilities. Both ResNet18 and ResNet50 perform well, but ResNet50 performs particularly well with the MSC and PC, obtaining test ACC of 99.50%, SEN of 100.00%, and SPE of 99.00%. With an ACC of 100.00% on validation and 97.70% on test, ShuffleNet with the RE_Coef likewise performs competitively. On the other hand, DenseNet201 shows a considerable drop in performance with some features, especially PLV, where it records a test ACC of 54.90% and SPE of 0.00%. Although ResNet50 achieves slightly higher peak metrics, ShuffleNet demonstrates greater efficiency and robust performance, especially with the PC and Re_Coef.

Table 3.2. Dataset 2's classification performance using several CNN techniques and connectivity-based featured images.

Its remarkable ability to detect affirmative classes is demonstrated by its flawless SEN of 100% on the test set using Re_Coef and its perfect validation ACC of 100% with PC. It also achieves a test ACC of 99.50% with Re_Coef, making it a leading rival in terms of total performance. The supremacy of ShuffleNet as a small and effective neural network specialization for mobile and low-resource contexts is supported by its architecture. In comparison to ResNet50, which has a more complicated architecture, it drastically lowers computational cost and model size by using methods like group convolutions and channel shuffling. ShuffleNet has the best performance-to-cost ratio with classification metrics of 99.50% accuracy and 100.00% sensitivity. Its applicability for real-world high-performance applications is demonstrated by its ability to reach peak accuracy comparable to bigger models while maintaining lower latency, power consumption, and memory footprint.

a) **b)**

Figure 3.2. a) Confusion Matrix, b) ROC curve, and AUC value obtained for the RE_Coef connectivity-based featured image test set of the ShuffleNet method for Dataset2

The test classification outcomes of the ShuffleNet method using the RE_Coef connectivity-based featured image set on Dataset 2 are shown in Figure 3.2. A ROC curve with the associated AUC value and a confusion matrix make up the figure. The model exhibits perfect ACC and SEN (100.0%). The error rate is 0.5% because there are only two false positives. The ShuffleNet design with the RE_Coef connectivity-based featured image set on Dataset 2 performs exceptionally well, as shown in these figures, with an AUC of 0.9998 and SEN of 100.0%, showing great diagnostic confidence with little false alarms. Its 99.5% total accuracy ranks it among the best for jobs involving medical classification.

4. CONCLUSION

The study effectively suggested a unique classification technique based on connectivity-based featured images for differentiating between control subjects and schizophrenia patients based on their EEG signals. The methodology used the image processing power of Convolutional Neural Networks to convert NxN connectivity matrices (generated from seven distinct functional connectivity parameters, such as RE_Coef and MSC) into images.

ShuffleNet with the RE_Coef feature outperformed the other four pre-trained CNN architectures (ResNet18, ResNet50, DenseNet201, and ShuffleNet) on two publicly available datasets. It obtained a near-perfect AUC of roughly 0.998, 100.00% sensitivity, and test accuracy of 98.70% and 99.50%. With relatively few false negatives, the model showed exceptional discriminatory strength, particularly on Dataset 2. ShuffleNet demonstrated its efficacy in low-resource environments by outperforming deeper models such as ResNet50 and DenseNet201. While DenseNet201 shows overfitting, the RE_Coef function is essential for success. Overall, this study highlights the value of ShuffleNet and RE_Coef in the diagnosis of schizophrenia and promotes the use of EEG connectivity patterns in Transfer Learning-based CNNs.

ÖZET

Funguslar, bakteriler, virüsler ve nematodlar gibi bitki patojenleri, küresel ürün verimliliğini ve gıda güvenliğini tehdit etmektedir. Geleneksel yönetim stratejileri, patojenlerin evrimi, çevresel kaygılar ve yavaş üreme döngüleri nedeniyle sıklıkla sınırlamalarla karşılaşmaktadır. CRISPR/Cas genom düzenleme teknolojisi, patojen kontrolü için hassas ve sürdürülebilir bir alternatif sunmaktadır. Cas9 gibi yaygın olarak kullanılan nükleazlar, Cas12a, Cas13, baz düzenleyiciler ve prime düzenleyiciler ile birlikte, konakçı veya patojen genomlarının ve transkriptomlarının hedefe yönelik modifikasyonunu mümkün kılar. RNA'yı hedefleyen varyantlar, viral patojenlerle geçici olarak etkileşime girerek transgenik olmayan hastalık kontrolü sağlar. CRISPR/Cas uygulamaları, fonksiyonel gen karakterizasyonunu, dayanıklı direnç mühendisliğini ve omik, HIGS ve nanopartikül aracılı teslimat ile entegrasyonu destekler. Temel zorluklar arasında dağıtım verimliliği, hedef dışı etkiler, düzenlemeler ve kamuoyu algısı bulunmaktadır. Gelecekteki yönelimler arasında çoklu düzenleme, AI destekli hedef tasarımı ve sahada kullanıma hazır dağıtım bulunmaktadır. Genel olarak, CRISPR/Cas, dayanıklı çeşitler geliştirmek ve sürdürülebilir tarımı ilerletmek için büyük bir potansiyele sahiptir.

Anahtar Kelimeler: CRISPR/Cas Genom Düzenleme, Bitki Patojen Direnci, Fungus, Bakteriyel ve Viral Hastalıklar, Duyarlılık Geni/Genleri Düzenleme, Sürdürülebilir Ürün Koruma

CRISPR-BASED GENOME EDITING STRATEGIES FOR SUSTAINABLE AND PRECISE CONTROL OF FUNGAL, BACTERIAL, VIRAL, AND NEMATODE PLANT PATHOGENS

ABSTRACT

Plant pathogens including fungi, bacteria, viruses, and nematodes threaten global crop productivity and food security. Conventional management strategies often face limitations due to pathogen evolution, environmental concerns, and slow breeding cycles. CRISPR/Cas genome-editing technology offers a precise and sustainable alternative for pathogen control. Widely used nucleases like Cas9, along with Cas12a, Cas13, base editors, and prime editors, enable targeted modification of host or pathogen genomes and transcriptomes. RNA-targeting variants allow transient interference with viral pathogens, providing non-transgenic disease control. CRISPR/Cas applications support functional gene characterization, engineering durable resistance, and integrating with omics, HIGS, and nanoparticle-mediated delivery. Key challenges include delivery efficiency, off-target effects, regulations, and public perception. Future directions involve multiplex editing, AI-assisted target design, and field-ready deployment. Overall, CRISPR/Cas holds great potential to develop resilient crops and advance sustainable agriculture.

Keywords: CRISPR/Cas Genome Editing, Plant Pathogen Resistance, Fungal, Bacterial, and Viral Diseases, Susceptibility Gene(s) Editing, Sustainable Crop Protection

1. INTRODUCTION

Plant pathogens including fungi, bacteria, viruses, and nematodes—pose major threats to global agriculture, causing severe yield losses and compromising food security. Conventional strategies like chemical pesticides and traditional breeding face limitations due to pathogen evolution, environmental concerns, and long development times (Ali et al., 2024; Mubeen et al., 2024). Genome-editing technologies, particularly CRISPR/Cas, offer a precise and efficient alternative for developing disease-resistant crops (Wang et al., 2020). CRISPR/Cas, derived from prokaryotic adaptive immunity, enables targeted DNA and RNA modifications using simple single-guide RNAs (sgRNAs) (Wang and Doudna, 2023). It can enhance plant resistance by editing host susceptibility (S) genes, boosting resistance (R) gene expression, or directly targeting pathogen genomes (Scheben et al., 2017). Applications include conferring resistance to fungal pathogens such as *Magnaporthe oryzae* in rice, *Zymoseptoria tritici* in wheat, and *Botrytis cinerea* in tomato, as well as degrading viral RNA genomes with CRISPR/Cas13 to combat potyviruses and geminiviruses (Islam et al., 2022). Beyond crop protection, CRISPR facilitates functional analysis of host and pathogen genes, revealing mechanisms of susceptibility, immunity, and resistance (Park et al., 2024). Integration with omics and systems biology approaches—genomics, transcriptomics, metabolomics provides comprehensive insights into plant defense networks and pathogen adaptation (Borah et al., 2024). Challenges remain in field applications, including off-target effects, delivery efficiency, regulatory hurdles, and public acceptance, as well as potential pathogen adaptation to CRISPR interventions (Hajiahmadi et al., 2019). Multiplex editing and combination with conventional breeding or biotechnological strategies can address these issues. Overall, CRISPR/Cas represents a transformative tool for sustainable agriculture, enabling rapid development of resilient crops, reducing reliance on chemical inputs, and offering durable, broad-spectrum pathogen resistance. Integrating CRISPR with AI, multi-omics, and complementary technologies promises to further enhance crop protection and productivity in the 21st century.

2. OVERVIEW OF CRISPR/CAS SYSTEMS

The CRISPR/Cas system, originally discovered as an adaptive immune mechanism in bacteria and archaea, has become a powerful tool for precise genome editing in plants. It functions through small CRISPR RNAs (crRNAs) that guide Cas nucleases to complementary DNA or RNA sequences, enabling targeted cleavage (Sorek et al., 2013). Among the many variants, Cas9 is the most widely used in plants, relying on a single-guide RNA (sgRNA) to introduce double-strand breaks at specific genomic loci. This break is then repaired by cellular mechanisms such as non-homologous end joining (NHEJ) or homology-directed repair (HDR), leading to insertions, deletions, or precise sequence modifications. Beyond Cas9, new variants like Cas12a (Cpf1), Cas13, and Cas14 expand the editing toolbox. Cas12a recognizes different protospacer adjacent motif (PAM) sites and creates staggered cuts, while Cas13 specifically targets RNA, opening avenues for transient control of pathogens without permanent genome modification (Yang et al., 2020). Prime editing and base editing further enhance precision by enabling nucleotide substitutions without double-strand breaks. These advancements highlight the versatility of CRISPR/Cas platforms in tailoring plant genomes for improved pathogen resistance (Liu et al., 2022).

3. APPLICATIONS IN PLANT PATHOGEN RESISTANCE

The application of CRISPR technology in crop protection has transformed how researchers and breeders approach plant disease management. Unlike traditional breeding, which relies on naturally occurring alleles of resistance (R) genes, CRISPR allows precise modification of host genomes to either enhance natural resistance or disrupt susceptibility (S) genes that pathogens

exploit (Zaidi et al., 2018). This strategy provides a faster, more targeted pathway to develop resistant cultivars that can withstand diverse classes of pathogens, including fungi, bacteria, viruses, and nematodes. Fungal, bacterial, viral, and nematode pathogens pose major threats to global agriculture, causing significant yield losses. Traditional control strategies, including fungicides, bactericides, and conventional breeding, are limited by environmental concerns, pathogen evolution, and slow development cycles. CRISPR/Cas genome-editing offers precise, efficient, and durable alternatives for crop protection. Fungal pathogens: Targeting host susceptibility (S) genes, such as the MLO family in wheat and barley or OsERF922 in rice, confers broad-spectrum resistance to powdery mildew and blast disease (Banerjee, 2025; Wang et al., 2016). Multiplex editing of multiple S genes enhances resistance durability, while direct targeting of fungal genomes is being explored to silence pathogenicity genes (Zhang et al., 2021). Bacterial pathogens: CRISPR/Cas9 editing of host S genes, such as OsSWEET promoters in rice, prevents bacterial effectors from hijacking host systems, conferring resistance to bacterial blight while maintaining growth (Blondel et al., 2016; Pacheco et al., 2018). CRISPR can also serve as a programmable antimicrobial, selectively eliminating pathogenic bacteria without affecting beneficial microbiota (Palacios et al., 2021). Viral pathogens: CRISPR/Cas9 targets DNA viruses like geminiviruses, suppressing replication and disease symptoms, while RNA-targeting Cas13 degrades RNA viral genomes, offering broad-spectrum protection against potyviruses and cucumber mosaic virus (Ali et al., 2024; Loriato et al., 2020). Multiplexed gRNAs against conserved viral regions reduce the risk of escape mutants (Roy et al., 2019). Nematodes: CRISPR-mediated disruption of host S genes or enhancement of immune receptors reduces nematode infection and gall formation (Dutta et al., 2023). Editing host factors involved in vector recognition can also limit transmission of insect-borne viruses (Huang et al., 2023).

4. CHALLENGES AND LIMITATIONS

CRISPR-based plant pathogen control holds great promise, but several technical, biological, regulatory, and socio-economic challenges must be addressed for field deployment. A major concern is off-target mutations, where Cas nucleases cleave unintended genomic sites, potentially causing unwanted phenotypes or reduced resistance (Ali et al., 2024). High-fidelity Cas variants and computational tools mitigate risk but cannot fully eliminate it, especially in polyploid crops like wheat (Nadeem et al., 2020). Efficient delivery of CRISPR components remains a bottleneck. Traditional methods such as *Agrobacterium*-mediated transformation and particle bombardment are labor-intensive and species-specific, while many crops remain recalcitrant to transformation. Alternatives like nanoparticle-mediated delivery, viral vectors, and protoplast transfection show promise but require further optimization for efficiency, stability, and scalability (Shivashakarappa et al., 2025; Levengood et al., 2024). Pathogens can evolve to overcome CRISPR-mediated resistance, similar to conventional R gene resistance. Viral escape mutants, such as in CRISPR-edited cassava targeting geminiviruses, highlight the need for multiplex editing, targeting conserved regions, and stacking edits with traditional resistance strategies (Metha et al., 2019; Sarfraz et al., 2025). Regulatory uncertainty also limits adoption. Policies differ globally, with countries like the US and Japan adopting permissive frameworks for non-transgenic edits, while the EU treats genome-edited crops as GMOs (Rozas et al., 2022). Harmonized, science-based regulations are needed for global deployment and trade (Brookes and Smyth, 2024). Finally, complex disease resistance traits governed by multiple genes remain challenging. Multiplex editing in polyploids and precise homology-directed repair (HDR) are technically difficult, limiting the introduction of complex resistance alleles. New tools such as prime editors may improve the efficiency of multi-gene editing and enable more durable disease resistance (May et al., 2023; Barka and Lee, 2022).

5. CONCLUSION

CRISPR/Cas technologies have emerged as a revolutionary tool in plant pathogen management, offering unprecedented precision, efficiency, and versatility. By enabling targeted editing of host susceptibility and resistance genes, as well as direct interference with pathogen genomes, CRISPR provides a powerful alternative to conventional breeding and chemical control methods. The diversity of CRISPR systems including Cas9, Cas12a, Cas13, base editors, and prime editors allows tailored approaches for DNA and RNA pathogens, facilitating broad-spectrum and durable resistance across a wide range of crops. Case studies in cereals, horticultural crops, and model plants demonstrate the practical potential of CRISPR to improve pathogen resistance while maintaining plant growth and yield. Integration with complementary technologies, such as omics-based target discovery, host-induced gene silencing, and advanced delivery systems, further enhances the efficacy and applicability of genome editing. Despite its promise, challenges remain, including off-target effects, delivery limitations, regulatory hurdles, and public acceptance. Addressing these concerns through improved Cas variants, multiplex editing strategies, AI-assisted design, and transparent stakeholder engagement will be critical for successful implementation. Overall, CRISPR/Cas-based approaches represent a transformative opportunity to develop resilient crops, reduce dependence on chemical inputs, and contribute to sustainable agriculture and global food security.

ÖZET

Bitkiler, funguslar ve miroorganizmalar tarafından üretilen biyojenik nanopartiküller (NP'ler), bitki büyümesini ve verimliliğini artırmak için çevre dostu, biyolojik olarak parçalanabilir ve biyouyumlu çözümler sunar. Bu NP'ler besin alımını artırır, fitohormonları uyarır, antioksidan savunmayı güçlendirir ve kuraklık, tuzluluk ve ağır metallere karşı toleransı artırır. Ag, ZnO, CuO ve TiO_2 gibi yaygın biyojenik NP'ler çimlenme, kök ve sürgün büyümesi, klorofil içeriği, biyokütle ve verimi önemli ölçüde iyileştirir. Tohum hazırlama, yaprak spreyi ve toprak ıslahı gibi uygulama yöntemleri hedefe yönelik dağıtımı mümkün kılarken, hassas tarımla entegrasyon verimliliği artırır. Biyojenik NP'ler ayrıca besin döngüsünü ve bitki sağlığını desteklemek için faydalı mikroplarla sinerjik olarak çalışır. Doz optimizasyonu ve çevresel değerlendirme yoluyla güvenli kullanımın sağlanması hala çok önemlidir. Genel olarak, biyojenik NP'ler bitki büyümesini teşvik etmek ve stresi azaltmak için sürdürülebilir araçlar olarak güçlü bir potansiyel göstermektedir, ancak saha doğrulaması, uygulama optimizasyonu ve akıllı tarım teknolojileriyle entegrasyon konusunda gelecekte daha fazla çalışma yapılması gerekmektedir.

Anahtar Kelimeler: Biyojenik Nanopartiküller, Bitki Büyümesini Teşvik Etme, Stres Toleransı, Nano Gübreler, Sürdürülebilir Tarım

BIOGENIC NANOPARTICLES FOR SUSTAINABLE ENHANCEMENT OF PLANT GROWTH: MECHANISMS, APPLICATIONS, AND FUTURE PROSPECTS

ABSTRACT

Biogenic nanoparticles (NPs) produced by plants, fungi, and microbes offer eco-friendly, biodegradable, and biocompatible solutions for improving plant growth and productivity. These NPs enhance nutrient uptake, stimulate phytohormones, strengthen antioxidant defenses, and boost tolerance to drought, salinity, and heavy metals. Common biogenic NPs such as Ag, ZnO, CuO, and TiO_2 significantly improve germination, root and shoot growth, chlorophyll content, biomass, and yield. Application methods—including seed priming, foliar sprays, and soil amendments enable targeted delivery, while integration with precision agriculture increases efficiency. Biogenic NPs also work synergistically with beneficial microbes to support nutrient cycling and plant health. Ensuring safe use through dose optimization and environmental assessment remains essential. Overall, biogenic NPs show strong potential as sustainable tools for plant growth promotion and stress mitigation, with future work needed on field validation, application optimization, and integration with smart farming technologies.

Keywords: Biogenic Nanoparticles, Plant Growth Promotion, Stress Tolerance, Nano-Fertilizers, Sustainable Agriculture

1. INTRODUCTION

Agriculture is increasingly threatened by soil nutrient depletion, environmental stresses, and excessive use of chemical fertilizers and pesticides, all of which reduce crop productivity and long-term sustainability. As a result, innovative solutions are needed to enhance plant growth while minimizing environmental impact. Nanotechnology offers one such approach, with biogenic NPs emerging as particularly promising due to their eco-friendly synthesis and multifunctional roles in plants (Tolisano and Del Buono, 2023). Produced from natural sources such as plants, bacteria, fungi, and algae, biogenic NPs are safer for crops, soil microbes, and ecosystems compared to chemically synthesized NPs. Their unique physicochemical and biological properties enable them to enhance nutrient uptake, stimulate plant hormones, and improve tolerance to both abiotic and biotic stresses (Bhati, 2023). They also interact positively with soil microorganisms, supporting microbial activity and overall soil health. Biogenic NPs function as nano-fertilizers, bio-stimulants, and stress mitigators, making them attractive tools for precision and sustainable agriculture. Interest in their use has expanded rapidly in recent years (Mishra, 2024), driven by their potential to reduce dependence on synthetic fertilizers and improve crop performance in a targeted manner. Ongoing research focuses on clarifying their mechanisms of action and optimizing their safe application in field conditions (Ali et al., 2024).

Despite their promise, key challenges remain, including dose optimization, phytotoxicity assessment, environmental safety, and scalable production (Deshmukh et al., 2023). Addressing these issues requires interdisciplinary collaboration across nanotechnology, plant physiology, soil science, and environmental research. Future directions include integrating biogenic NPs with smart delivery systems, precision agriculture tools, and data-driven approaches. Overall, biogenic NPs represent a rapidly advancing and sustainable strategy to enhance plant growth, nutrient efficiency, and stress resilience while minimizing environmental risks.

2. SYNTHESIS OF BIOGENIC NPS

2.1 Plant-Mediated Synthesis

Plants are rich in biomolecules such as flavonoids, phenolics, terpenoids, and proteins that can reduce metal ions to form NPs. Extracts from leaves, roots, fruits, and seeds have been widely used to synthesize silver, zinc oxide, copper oxide, and titanium dioxide NPs (Shyam et al., 2021). In these extracts, reducing agents convert metal salts into nanoscale particles, while natural capping agents stabilize them and prevent aggregation. This green synthesis is simple, cost-effective, and environmentally safe, with particle size and shape easily controlled by adjusting extract concentration, temperature, pH, and reaction time. Plant-mediated NPs are highly biocompatible with plants and soil microbes (Khan et al., 2025). For example, leaf extracts of *Azadirachta indica* and *Ocimum sanctum* have been used to produce silver and zinc oxide NPs that enhance seed germination and early seedling growth in wheat and tomato (Giri et al., 2023; Ansari et al., 2023). These NPs also exhibit strong antimicrobial activity, helping protect crops from pathogens. Because the process avoids toxic chemicals, it reduces environmental risks and yields biodegradable, non-toxic NPs suitable for agriculture. Advances in phytochemical analysis are helping identify the specific plant compounds responsible for nanoparticle formation (Zuhrotun et al., 2023), enabling better optimization of synthesis conditions for uniform and functionally enhanced NPs. Additionally, agricultural waste is increasingly being explored as a low-cost feedstock for NP production. Overall, plant-mediated synthesis offers an efficient, sustainable, and highly functional approach for generating biogenic NPs to support plant growth and stress tolerance.

2.2 Microbe-Mediated Synthesis

Microorganisms including bacteria, fungi, and algae can synthesize NPs through enzymatic reduction of metal ions. Fungi are especially effective producers due to their abundant extracellular enzymes and metabolites (Zhou et al., 2024), while bacterial genera such as *Bacillus* and *Pseudomonas* have been widely used to generate silver, gold, and zinc NPs. Depending on the microbial strain, growth conditions, and metal precursor concentration, NPs can be produced intra- or extracellularly with tunable size and morphology (Tsekhmistrenko et al., 2020). Algal species are also emerging as efficient NP producers, often yielding particles enriched with bioactive compounds that further enhance plant growth (Koul et al., 2021). Microbe-mediated NP synthesis is sustainable, avoids hazardous chemicals, and naturally stabilizes NPs through microbial proteins. These NPs interact synergistically with plant roots, improving nutrient uptake and stimulating growth-promoting hormones. The process is scalable under controlled conditions, making it suitable for commercial production. Additionally, microbial systems offer complementary benefits such as soil enrichment and biocontrol activity (Koskey et al., 2021). Recent work shows that fungal-derived ZnO NPs can boost chlorophyll levels and antioxidant activity in crops (Singh et al., 2024). Integrating microbial NPs with biofertilizers represents a promising strategy for sustainable and circular agriculture, utilizing low-cost microbial biomass and residues.

3. MECHANISMS OF PLANT GROWTH ENHANCEMENT

3.1 Improved Nutrient Uptake and Bioavailability

Biogenic NPs enhance plant nutrient uptake by increasing the availability and mobility of macro- and micronutrients (Semenova et al., 2024). Their high surface-area-to-volume ratio facilitates nutrient adsorption and transport, while slow release of ions from NPs like ZnO, Ag, and Cu improves root absorption and phosphorus and iron mobilization (Kachel et al., 2021). NPs can penetrate roots and leaves, interacting with transport proteins and stomata to boost nutrient assimilation (Hong et al., 2021), and they also support soil microbes in solubilizing otherwise inaccessible nutrients. Applications such as seed priming or foliar sprays improve germination, early growth, chlorophyll content, protein synthesis, and overall plant vigor, while reducing fertilizer losses and environmental contamination (Fatima et al., 2021). By activating root transporters and enhancing ion uptake under nutrient-limited conditions (Zhao et al., 2024), biogenic NPs optimize nutrient efficiency, maintain soil fertility, and act as nano-fertilizers and growth promoters, supporting sustainable agriculture.

3.2 Stimulation of Phytohormones

Nanoparticles (NPs) can modulate plant hormone levels and signaling pathways, enhancing growth and development. They influence the synthesis of auxins, cytokinins, gibberellins, and abscisic acid, promoting root elongation, lateral root formation, shoot growth, leaf expansion, chlorophyll synthesis, stem elongation, and flowering (Tripathi et al., 2022). Seed priming with NPs accelerates early development by activating hormone-related genes (Khan et al., 2023), improving nutrient allocation, stress tolerance, photosynthetic efficiency, and secondary metabolite production. Controlled NP doses optimize hormonal balance without toxicity, and integration with bio-stimulants or microbial inoculants can further enhance effects. Studies report increased biomass, leaf area, and faster germination in crops treated with biogenic NPs (Mickky, 2025), highlighting their potential as a sustainable, non-chemical strategy to boost crop growth.

3.3 Enhanced Stress Tolerance

Abiotic stresses such as drought, salinity, heavy metals, and extreme temperatures limit global crop productivity. Biogenic NPs enhance plant stress tolerance by activating antioxidant systems, including superoxide dismutase, catalase, and peroxidase, reducing oxidative damage (Shaikh et al., 2025). Zinc oxide NPs, for example, improve drought tolerance in wheat by increasing osmolyte accumulation, chlorophyll content, membrane stability, and water retention. NPs can chelate heavy metals, maintain ion homeostasis in saline soils, and trigger stress-responsive genes, boosting photosynthesis, energy metabolism, root growth, and yield (Tombuloglu et al., 2024). Their small size allows cellular-level action, and synergistic interactions with beneficial microbes further enhance resilience (Anas et al., 2025). Biogenic NPs thus function as effective nano-protectants, helping plants withstand environmental stresses.

4. APPLICATIONS OF BIOGENIC NPS IN AGRICULTURE

Biogenic NPs have versatile applications in agriculture, enhancing plant growth, productivity, and stress tolerance. Seed priming with Ag, ZnO, and CuO NPs improves germination, seedling vigor, root and shoot development, water uptake, enzyme activity, and resistance to abiotic stresses while reducing seed-borne pathogens (Kathiravan et al., 2024). Foliar sprays deliver nutrients directly through stomata, boosting chlorophyll content, photosynthesis, antioxidant activity, and drought and salinity tolerance. Soil amendments enhance nutrient availability, root growth, microbial activity, nitrogen fixation, and mycorrhizal symbiosis, while mitigating nutrient leaching and heavy metal stress. Integration with hydroponics and precision agriculture allows targeted nutrient delivery and real-time monitoring, optimizing yield and quality with minimal environmental impact (Bouarroudj et al., 2025). Combining NPs with bio-stimulants or beneficial microbes further improves nutrient use efficiency and stress resilience. Overall, biogenic NPs provide a sustainable, multifunctional, and eco-friendly approach to modern crop production.

5. SAFETY AND ENVIRONMENTAL CONSIDERATIONS

Biogenic NPs are generally safe for agriculture, but excessive concentrations can cause phytotoxicity by disrupting cellular metabolism, inducing oxidative stress, and damaging membranes. Dose optimization, particle size control, and appropriate application methods are therefore crucial. Low to moderate doses of Ag, ZnO, and CuO NPs enhance growth, whereas higher doses can inhibit germination, reduce biomass, and impair chlorophyll synthesis and root development (Wohlmuth et al., 2022). Green-synthesized NPs are more biocompatible than chemical ones, and coatings or controlled-release systems can further reduce toxicity. While NPs can interact with soil, water, and microbes, optimized applications support beneficial microbial activity, reduce chemical fertilizer use, and minimize environmental contamination (Elsilk et al., 2024). Long-term field studies, monitoring, and regulatory frameworks are essential to ensure sustainable use, addressing safe concentrations, environmental impacts, and phytotoxicity (Vilela et al., 2023). Careful application and adherence to guidelines make biogenic NPs an eco-friendly and effective tool for sustainable agriculture.

6. CONCLUSION

Biogenic NPs represent a transformative tool for sustainable agriculture. Their green synthesis using plants, fungi, and microbes ensures biocompatibility, biodegradability, and reduced environmental risks. These NPs enhance plant growth through improved nutrient uptake, stimulation of phytohormones, and activation of antioxidant defenses. They provide increased

tolerance to abiotic stresses such as drought, salinity, and heavy metals. Seed priming, foliar sprays, and soil amendments are effective methods for delivering NPs to crops. Integration with hydroponics and precision agriculture further maximizes their efficiency and sustainability. Silver, zinc oxide, copper oxide, and titanium dioxide NPs are the most widely studied and have demonstrated significant improvements in germination, biomass, yield, and quality. Safety and environmental considerations, including dose optimization, phytotoxicity assessment, and microbial impact, are essential for responsible use. Overall, biogenic NPs offer a promising strategy to enhance plant growth, resilience, and productivity in a sustainable and environmentally responsible manner. Their multifunctional role as growth promoters, nutrient enhancers, and stress mitigators positions them as a key innovation in next-generation agriculture. With continued research, optimized application strategies, and regulatory support, biogenic NPs have the potential to revolutionize sustainable crop production worldwide.

ÖZET

Ege Bölgesi'ndeki en büyük yüzey alanına sahip ve en önemli balıkçılık sahalarından biri olan Demirköprü Baraj Gölü'nde (Manisa) ticari balıkçılığın serbest olduğu Haziran 2024-Şubat 2025 döneminde ayda 2 gün olmak üzere karaya çıkış noktalarında gözlem ve balıkçılarla anket yapılarak balıkçıların günlük av miktarları, kullandıkları av araçlarının türü (uzatma ağı, pinter, paraketa) ve miktarları tespit edilmiştir. Çalışma boyunca 349'u sadece uzatma ağı kullanan, 27'si sadece pinter kullanan, 23'ü sadece paragat kullanan, 37'si uzatma ve pinteri birlikte kullanan, 30'u uzatma ve paragatı birlikte kullanan olmak üzere toplam 466 balıkçı teknesi örneklenmiştir. Av miktarı ve çaba (uzatma ağı, pinter, paraketa miktarı) verileri kullanılarak; av sezonu ve aylar için birim çaba başına düşen av miktarı (CPUE) değerleri av aracı bazında olmak üzere uzatma ağı (kg / m / gün), pinter (kg / adet / gün) ve paragat (kg / 100 iğne / gün) için hesaplanmıştır. Av sezonu için av aracı bazında CPUE değerleri uzatma ağında 0,030 ± 0,015 kg/m/gün, pinterde 0,139 ± 0,078 kg/adet/gün ve paragat için 0,153 ± 0,075 kg/100 iğne/gündür. CPUE değerlerinin aylık karşılaştırmalarında, üç av aracında da aylar arasında istatistik olarak anlamlı farklılık tespit edilmiştir (uzatma ağı için p = 0,001; pinter için p = 0,016; paragat için p = 0,028).

DETERMINATION OF FISHING EFFORT AND CATCH PER UNIT EFFORT (CPUE) BASED ON FISHING GEAR IN DEMİRKÖPRÜ DAM LAKE FISHERY

ABSTRACT

Surveys were conducted with fishermen at landing points twice a month to determine the daily catch, the types and quantities of fishing gear (gillnets, trawls, longlines) during the period when commercial fishing season (June 2024–February 2025) at the Demirköprü Dam Lake (Manisa), which has the largest surface area and is one of the most important fishing areas in the Aegean Region. A total of 466 fishing vessels were sampled, 349 of which used only gillnets, 27 of which used only fyke nets, 23 of which used only longlines, 37 of which used both gillnets and fyke nets, and 30 of which used both gillnets and longlines. Using the catch amount and effort (gillnet, fyke net, longline amount) data, the catch per unit effort (CPUE) values for the fishing season and months were calculated on a fishing gear basis for gillnet (kg/m/day), fyke net (kg/number /day) and longline (kg/100 hooks/day). For the fishing season, the CPUE values on a gear basis were 0.030±0.015 kg/m/day for gillnets, 0.139±0.078 kg/number/day for fyke nets and 0.153±0.075 kg/100 needles/day for longlines. Statistically significant differences were found in monthly comparisons of CPUE values for all three types of fishing gear (for gillnets p=0,001; for fyke nets p=0,016; for longlines p=0,028).

Keywords: Demirköprü Dam Lake, CPUE, gillnet, fyke net, longline

GİRİŞ

Ege Bölgesi'nin en fazla yüzey alanına sahip baraj gölü olan Demirköprü Baraj Gölü'nde (Anonim, 1989; Ünal vd., 2011) yürütülen bilimsel çalışmalar ve literatür incelendiğinde; kullanılan av araçları ve hedeflenen ticari türler (Dereli ve diğ., 2018), gümüşi havuz balığının biyolojik özellikleri (Dereli ve diğ., 2021), sazan balıkçılığındaki uzatma ağlarının av verimi/seçiciliği ve sazan balıkçılığının yönetimi (Dereli ve diğ., 2022), sazan balığının büyüme modelleri (Dereli ve Bayhan, 2023) konularının ele alındığı görülmektedir.

Birim çaba başına düşen av miktarı (CPUE), temel balık stoklarının zaman içindeki göreceli bolluğu veya göreceli biyokütle eğilimlerindeki geniş eğilimlerin birinci dereceden değerlendirilmesi için sıklıkla kullanılan temel bir balıkçılık bilimi ölçüsüdür (Skalski ve diğerleri, 2005; Belhabib ve diğerleri, 2018). CPUE'nin sınırlamaları olsa da, özellikle daha ayrıntılı verilerin ve stok değerlendirmelerinin mevcut olmadığı (Stamatopoulos, 2002) ve açık veya yarı açık erişimli balıkçılığın baskın olduğu, yani kısıtlayıcı olduğu durumlarda, bir balıkçılığın uzun vadeli eğiliminin izlenmesinde faydalı olabilir (Zeller ve diğ., 2021). Bu çalışmada; Demirköprü Baraj Gölü için balıkçılık çabası ve CPUE değerlerinin av aracı bazında tespit edilmesi amaçlanmıştır.

MATERYAL VE METOT

Demirköprü Baraj Gölü'nde (Manisa) ticari balıkçılığın serbest olduğu Haziran 2024-Şubat 2025 döneminde ayda 2 gün olmak üzere karaya çıkış noktalarında gözlem ve balıkçılarla anket yapılarak balıkçıların günlük av miktarları, kullandıkları av araçlarının türü (uzatma ağı, pinter, paraketa) ve miktarları tespit edilmiştir. Uzatma ağlarının donam faktörleri, balıkçılarla görüşülerek, karaya çıkış noktalarında ağlar kontrol edilerek ve ağları yapan balıkçılarla görüşülerek tespit edilmiştir. Av miktarı ve çaba (uzatma ağı, pinter, paraketa miktarı) verileri kullanılarak; av sezonu ve aylar için birim çaba başına düşen av miktarı (CPUE) değerleri av aracı bazında olmak üzere uzatma ağı (kg/m/gün), pinter (kg/adet/ gün) ve paragat (kg/100 iğne/gün) için hesaplanmıştır.

Veriler, IBM SPSS Statistics 22.0 (IBM Corp., Armonk, New York, ABD) istatistik paket programında değerlendirilmiştir. Tanımlayıcı istatistikler olarak örneklem sayısı (n), ortalama ±standart sapma ($\bar{x} \pm ss$), %95 güven aralığı (GA), Medyan ve IQR (çeyrekler arası aralık) değerleri verilmiştir. Sayısal değişkenlere ait verilerin normal dağılımı Shapiro Wilk normallik testi ve Q-Q grafikleri ile değerlendirilmiştir. CPUE değerlerinde gruplar (aylar) arası karşılaştırmalar, normal dağılım gösteren değişkenlerde tek yönlü varyans analizi ile, normal dağılım göstermeyen değişkenlerde Kruskal-Wallis analizi ile yapıldı. Çoklu karşılaştırma testi olarak normal dağılan değişkenlerde Tukey HSD, normal dağılmayan değişkenlerde Dunn-Bonferroni testi kullanıldı. $p<0,05$ değeri istatistiksel olarak anlamlı kabul edildi.

BULGULAR

Aylık örneklemelerde 9 aylık çalışma boyunca örneklenen 466 balıkçı teknesinin 349'u sadece uzatma ağı kullanan, 27'si sadece pinter kullanan, 23'ü sadece paragat kullanan, 37'si uzatma ve pinteri birlikte kullanan, 30'u uzatma ve paragatı birlikte kullanan teknelerdir.

Uzatma ağlarında donam faktörleri ve bir posta ağ uzunluğu; 50 mm göz açıklığına sahip ağlarda 0,40 (80,8 m), 65 mm göz açıklığına sahip ağlarda 0,39 (77,7 m), 70 mm göz açıklığına sahip ağlarda 0,35 (68,9 m), 75 mm göz açıklığına sahip ağlarda 0,32 (64,3 m), 80 mm göz açıklığına sahip ağlarda 0,30 (60,3m), 85 mm göz açıklığına sahip ağlarda 0,27 (52,9 m), 90 mm göz açıklığına sahip ağlarda 0,24 (47,2 m) olarak hesaplanmıştır.

Uzatma ağı için kg/m/gün, pinter için kg/adet/gün ve paragat için kg/100 iğne/gün olarak hesaplanan aylık ve av sezonu CPUE değerlerinin tanımlayıcı istatistikleri Tablo 1'de verilmiştir. Av sezonu ortalama CPUE değerleri uzatma ağında 0,030±0,015 kg/m/gün, pinterde 0,139±0,078 kg/adet/gün ve paragat için 0,153±0,075 kg/100 iğne/gün olarak hesaplanmıştır (Tablo1).

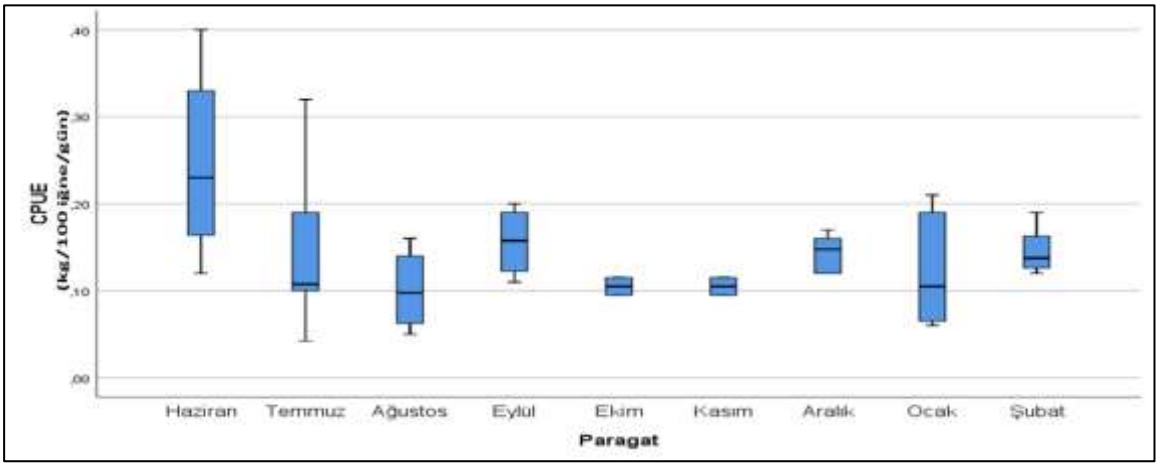
[a, b, c] üst simgeleri gruplar arası farklılığı göstermektedir. Aynı harflerin yer aldığı gruplarda fark bulunmamaktadır.

Uzatma ağında, Haziran ayındaki CPUE değerleri istatistik olarak anlamlı derecede Temmuz, Ağustos, Eylül, Ekim aylarından daha yüksektir. Eylül ve Ekim ayları değerleri diğer tüm aylardan istatistik olarak anlamlı derecede daha düşüktür ($p<0,05$) (Tablo 2 ve Şekil 1).



Şekil 1: Uzatma ağı CPUE değerlerinin aylık değişimi

Pinterde CPUE değerlerinin istatistik olarak anlamlı derecede fark bulunmamakla birlikte Haziran ayında en yüksek, Şubat ayında ise en düşük olduğu belirlenmiştir (Tablo 2 ve Şekil 2).

Şekil 2: Pinter CPUE değerlerinin aylık değişimi

Paragatta en yüksek CPUE değeri, istatistik olarak anlamlı derecede fark bulunmamakla birlikte Haziran ayında, en düşük ise Ağustos ayında tespit edilmiştir (Tablo 2 ve Şekil 3).

Şekil 3: Paragat CPUE değerlerinin aylık değişimi

TARTIŞMA VE SONUÇ

Demirköprü Baraj Gölü balıkçılığında uzatma ağı, pinter ve paragat av araçlarını tek başına kullanan tekneler olduğu gibi, iki av aracını (uzatma ağı ve pinter; uzatma ağı ve paragat) birlikte kullanan tekneler de bulunmaktadır. Av aracı bazında tespit edilen CPUE'larda aylık değerler arasında istatistiksel farklılık vardır. En yüksek değerler, paragat ve pinterde istatistiksel fark bulunmamakla birlikte av sezonu başında Haziran ayındadır.

Balıkçılar her üç av aracıyla da sazan ve yayın türünü hedeflemekte olup uzatma ağı balıkçılığında 65-90 mm ağ göz genişliklerindeki ağları kullanmaktadırlar. Balıkçılar, av miktarındaki düşüş nedeniyle Kasım ayından itibaren *Carassius sp.* türlerini hedefleyerek daha düşük göz genişliklerindeki uzatma ağlarını da (50 mm) kullanmaktadırlar. Bu sebeple toplam av miktarı, Kasım-Şubat döneminde *Carassius sp.* türünün av vermesiyle sezon başı değerlerine ulaşamasa da artmıştır.

Ülkemizde içsu balıkçılığında Beyşehir Gölü (Konya) (Balık, 2001), Uluabat Gölü (Bursa) (Balık ve Çubuk, 2001), Homa Lagünü (İzmir) (Acarlı ve diğ, 2009), Demirköprü Baraj Gölü

(Manisa) (Şen, 2016, Eğirdir Gölü (Isparta) (Korkmaz ve Kuşat, 2020), Beymelek Lagünü (Antalya) (Özbolat, 2022)], Atikhisar Baraj Gölü (Çanakkale) (Demirkıran ve Özekinci, 2022) ve Van İlinde bulunan baraj gölleri (Demir, 2023) için uzatma ağlarında CPUE hesaplanmıştır. Uzatma ağları için elde edilen bulguları, önceki çalışmaların birçoğuyla hedef tür veya CPUE birim farklılığı nedeniyle karşılaştırmak mümkün olmamıştır. Bu çalışmada monofilament uzatma ağında (50, 60, 65, 70, 75, 80 ve 90 mm ağ göz genişliklerinde) av sezonu için elde edilen CPUE değeri (0,030±0,015 kg/m/gün), Balık (2011) tarafından Beyşehir Gölü'nde 28, 40, 50 ve 60 mm ağ göz genişliğindeki monofilament (22,39 g/m) ve multifilament uzatma ağlarında (11,12 g/m) hesaplanan değerlerden daha yüksektir. Ancak daha küçük ağ göz genişlikleri (18, 20, 22, 26, 30 ve 36 mm) kullanan diğer bir çalışmadan (Balık ve Çubuk 2001)'den ise oldukça düşüktür. Değerlerdeki farklılıkların, habitat ve hedef tür farkı ile Balık (2001) ve Balık ve Çubuk (2001)'den daha küçük ağ gözleri kullanılmasından kaynaklandığı düşünülmektedir. Balıkların uzatma ağına yakalanmasında ağ gözü açıklığı önemli rol oynamaktadır (Stewart 1987). Av araçlarının birim av miktarları, yakalanması hedeflenen balık türünün yoğunluğuna bağlıdır (Stewart 1987).

Hedef türün ve göz açıklıklarının kısmen benzediği diğer bir çalışmada ise Demir (2023), Van baraj göllerinde sazan için CPUE 55, 60, 65 ve 70 mm ağ göz genişliklerinde uzatma ağında Sarımemet Baraj Gölünde 0,85 kg/100 m/posta, Koçköprü Baraj Gölünde 0,99 kg/100 m/posta, Zernek Baraj Gölünde 0,67 kg/100 m/posta olarak saptanmıştır.ve bu çalışmadan daha yüksektir. Farklılığın habitat farklılığından kaynaklandığı düşünülmektedir. Habitatın yanı sıra birim av miktarını (CPUE) etkileyen su sıcaklığı, besin durumu, oksijen miktarı, akıntı, ay ışığı, gece ve gündüz sürelerindeki değişim gibi pek çok faktör vardır. Bilindiği üzere, pasif olan uzatma ağları ile avcılıkta balıkların aktiviteleri çok önemlidir. Balıkların aktiviteleri de bu faktörlere bağlı olarak değişiklik gösterebilmektedir (Balık ve Çubuk, 2001).

Habitatın aynı olduğu, hedef türün ve göz açıklıklarının kısmen benzediği diğer bir çalışmada ise (Şen, 2016), Demirköprü Baraj Gölü'nde (Manisa) sazan için 65, 70, 75, 80 mm ağ göz genişliğine sahip multifilament uzatma ağlarında ve toplamda CPUE sırasıyla 21,90±10,03; 15,98±7,59; 9,44±5,28; 14,11±6,48 ve 15,36±7,34 g/m/operasyon olarak tespit edilmiş olup, bizim değerlerimiz daha düşüktür. Farklılığın bu çalışmada monofilament ağ kullanılmasından ve sazana ilaveten Yayın ve *Carassius* sp. balıklarının da hedeflenmesinden kaynaklandığı düşünülmektedir. Monofilament (misina) ağlar şeffaf olmalarından dolayı multifilament ağlara oranla balıklar tarafından daha zor görülürler. Bu sebeple monofilament ağların av verimliliği daha yüksektir (Karlsen ve Bjarnason, 1987; Korkmaz ve Kuşat, 2020).Aynı göz genişliğine sahip multifilament uzatma ağlarının monofilament ağlardan daha düşük CPUE'ye sahip olduğu diğer çalışmalarda da vurgulanmıştır (Balık, 2001; Balık ve Çubuk, 2001; Korkmaz ve Kuşat, 2020).

Ülkemiz içsularında pinterlerle kerevit (*Pontastacus leptodactylus* Eschscholtz, 1823) avcılığında CPUE değerleri, Atikhisar Baraj Gölü'nde (Çanakkale) adet/tuzak/gün (Demirkıran ve Özekinci, 2022), Fırat Nehri üzerinde bulunan Keban Baraj Gölü'nde (Elazığ) (Dartay, 2023; Demirol ve Yüksel, 2014) ve Hirfanlı Baraj Gölü'nde (Kırşehir) (Cilbiz ve diğ., 2021) g/pinter/gün olarak hesaplanmıştır. Bu çalışmada ise CPUE sazan ve yayın için pinterde kg/adet/gün olarak hesaplanmış olup, çalışma bulguları hedef tür farklılığı nedeniyle önceki çalışmalarla karşılaştırılamamıştır.

Paragat için Ülkemiz içsularında CPUE değerlerini belirlemeye yönelik çalışmaya rastlanılmamış olup, sınırlı sayıda çalışmanın (Şensurat ve Akyol, 2019; Dereli ve diğ., 2015) denizlerdeki küçük ölçekli balıkçılıkta yürütüldüğü belirlenmiştir. Yayın türünü hedefleyen paragatta CPUE değerini kg/100iğne/gün olarak hesaplayan bu çalışmanın Ülkemiz içsularında

bu konuda yürütülmüş ilk çalışma olması nedeniyle literatürdeki önemli bir boşluğu dolduracağı düşünülmektedir.

Sonuç olarak, bu çalışma ile Demirköprü Baraj Gölü'nde balıkçılık çabası ve av araçlarının CPUE'leri belirlenmiş olup, sazan ve yayın türlerini hedefleyen pinter için ve yayın türünü hedefleyen paragat için CPUE değerleri ilk kez ortaya konmuştur. Bu çalışmaların gelecekte de devam ettirilmesi, CPUE vasıtasıyla balık stoklarına ilişkin dolaylı bilgi edinmek ve bu stoklar üzerinde sağlıklı balıkçılık yönetimi kararları alabilmek için gereklidir.

TEŞEKKÜR

Bu çalışma, TÜBİTAK tarafından desteklenen 2209-A Üniversite Öğrencileri Araştırma Projeleri Destek Programı (1919B012322934 başvuru numaralı) kapsamında yürütülmüş olup, projeye sağladığı desteklerden dolayı Türkiye Bilimsel ve Teknolojik Araştırma Kurumu'na (TÜBİTAK) teşekkür ederiz. Saha çalışmalarında avcılık verilerini paylaşarak projeye önemli katkılarda bulunan S.S. Köprübaşı Balıkçılık Kooperatifi Başkanı Sayın Ramazan UYSAL'a ve değerli kooperatif üyelerine teşekkürlerimizi sunarız.

ÖZET

Artan gıda talebi, broyler sektöründe hızlı büyüme ve yüksek canlı ağırlık hedeflerinin öncelikli hale gelmesine yol açmıştır. Bu durum iskelet gelişimi ile büyüme hızı arasındaki dengesizliğe, bacak kemikleri, eklemler ve bağ dokuların zayıflamasına yol açmakta ve broyler piliçlerde topallık ile iskelet kas sistemi problemlerini arttırmaktadır. Bacak sağlığının korunması, üretim performansı ile hayvan sağlığı ve refahı açısından kritik öneme sahiptir. Topal piliçlerin hareket edememesi ve yem ile suya ulaşmakta zorlanması, hem ağrı ve ızdıraba neden olur hem de üretim kayıpları ile gıda güvenliği risklerini artırmaktadır. Broyler piliçlerin yürüme fonksiyonunu ve sürü refahını değerlendirmek için geliştirilen yöntemler, gözlemsel ve teknolojik yaklaşımlar olarak sınıflandırılabilir. Gözleme dayalı yöntemler, hayvanın davranış ve fiziksel durumunu incelemeye dayalı olup**,** yürüyüş skorlama, ayak tabanı ve diz eklemi yangısı skorlamaları ile Yatmanın Gecikmesi Testi gibi uygulamaları içerir. Teknolojik yöntemler ise ivme ölçerlerin kullanıldığı sensör tabanlı otomatik ölçümler, bilgisayar görüntüleme tekniklerinin kullanıldığı optik akış ve kinetik analizler ile kızılötesi termografi değerlendirmeleri gibi uygulamaları kapsar**.** Bu yöntemler, ekipman gereksinimi, uygulama kolaylığı ve gözlemci eğitim gereksinimi gibi özellikler bakımından farklılık göstermektedir. Piliçlerde bacak sağlığı ve yürüme fonksiyonunun değerlendirilmesinde kullanılacak yöntemin seçimi, ölçümün amacı, uygulanabilirlik ve doğruluk kriterleri dikkate alınarak yapılmalıdır. Bu bildiride, broyler piliçlerde bacak fonksiyonlarını değerlendirmek için geliştirilen gözleme dayalı manuel yöntemler ile teknolojik yöntemleri içeren güncel bilimsel gelişmeler özetlenmiştir. Ayrıca, hassas hayvancılık uygulamalarına dayalı yeni yöntemlerin ticari koşullara uyarlanması ve doğrulanmasının, broyler piliçlerin refahını izleme ve üretim performansını arttırmadaki potansiyel katkıları tartışılmıştır.

Anahtar Kelimeler: Broyler Piliç, Değerlendirme Yöntemleri, Bacak Sağlığı, Yürüme Fonksiyonu

ASSESSMENT OF LEG HEALTH AND LOCOMOTOR FUNCTION IN BROILER CHICKENS

ABSTRACT

Rapid growth and high body weight targets have been prioritised in the broiler industry due to rising global demand for food. This has led to an imbalance between the development of the skeleton and its growth rate, resulting in weaker leg bones, joints, and connective tissues, and an increase in the prevalence of lameness and skeletal disorders in broiler chickens. Maintaining leg health is crucial for production efficiency and animal welfare. Lame birds have difficulty moving and accessing feed and water, which causes them pain and distress and contributes to production losses and increased food safety risks. Methods developed to assess walking ability and flock welfare in broiler chickens can be broadly classified as either observational or technological. Observational methods involve directly examining behaviour and physical condition, including gait scoring, footpad and hock burn scoring, and the latency-to-lie test. Technological approaches include sensor-based automated measurements using accelerometers and optical flow, as well as kinematic analyses employing computer vision techniques and infrared thermography assessments. These methods differ in terms of their equipment requirements, how easily they can be implemented, and whether observer training is necessary. The choice of an appropriate method for evaluating leg health and walking ability in broiler chickens should consider the purpose of the measurement, as well as the feasibility and accuracy criteria. This paper summarises recent scientific advancements and examines both manual observation-based methods and technological approaches developed for assessing leg function in broilers. Furthermore, this paper discusses the potential contributions of precision livestock technologies to monitoring broiler welfare and enhancing production performance, including their adaptation and validation under commercial conditions

Keywords: Broiler Chicken, Assessment Methods, Leg Health, Locomotor Function

GİRİŞ

Hızlı büyüme yönünde selekte edilen ağır yapılı broyler piliçlerde, gelişimsel, dejeneratif ve enfeksiyöz kökenli bacak problemleri ve buna bağlı topallık sık görülmektedir. Bu durum endüstride verim düşüklüğü ve ekonomik kayıplara yol açmaktadır (Bradshaw vd. 2002; Caplen vd. 2012). Topallık, yürüyüş yeteneğinde belirgin bozulma olarak tanımlanır ve sahada manuel olarak değerlendirilmesi zaman alıcı, maliyetli ve hayvanları rahatsız edici olduğundan genellikle üretim döngüsünün sonunda ve çoğunlukla bir kez olmak üzere sürüden alınan bir örneklem üzerinde gerçekleştirilmektedir (Weeks vd. 2000; Mullan vd. 2009). Broylerlerde yaygın olarak kullanılan geleneksel deri lezyonları ve yürüyüş skorlama yöntemleri eğitimli değerlendiricilerin gözlemleyerek ve manuel olarak gerçekleştirdikleri değerlendirmeler olması nedeniyle subjektif, zaman alıcı ve operasyonel açıdan maliyetlidir (Kestin vd. 1994; Reiter ve Bessei 1997; Butterworth 1999; Bessei, 2006; Pearce vd. 2023; Kwon vd. 2024). Broyler piliç yetiştirme sistemlerinde ve özellikle barındırma yoğunluğunun yüksek olduğu koşullarda bacak hastalıkları ve yürüyüş bozukluğu sağlık ve performansı olumsuz etkiler ve sürü ve birey düzeyinde yapılacak geleneksel değerlendirmelerle başarı şansı daha düşük olmaktadır (Bokkers ve de Boer 2009; Dawkins 2017; Pereira vd. 2025). Geleneksel metotlarla yapılan bireysel izleme yöntemleri, binlerce broyleri barındıran ticari işletmelerde pratik zorluklara neden olmaktadır ve sürü hareketinin izlenmesine ilişkin hayvan refahı değerlendirmelerinin de yapılmasında güçlükler meydana gelmektedir **(**Gebhardt-Henrich vd. 2021; Pereira vd. 2025;). Ayrıca bu değerlendirmeler sınırlı sayıda piliç üzerinde yapılmaktadır ve elde edilen sonuçlar hem incelenen bireyin yaşamının tamamındaki refah durumunu yansıtmak bakımından hem de tüm sürüye ilişkin olası sağlık ve refah problemlerinin zamanında belirlenmesinde yeterli olmamaktadır. Bu nedenle, canlı piliçlerden sürekli veri toplayabilen sistemlerle refah parametrelerinin düzenli ve otomatik olarak izlenmesi piliçlerin refahı standartlarının karşılanması yanı sıra yetiştiriciler ve hayvan ıslahçılarının ihtiyaç duydukları veri setlerini elde edebilmeleri için çok önemlidir (Dawkins vd. 2009; Wurtz ve Riber, 2024). Son dönemde davranış ve sağlık göstergeleri dahil olmak üzere hayvan refahının gerçek zamanlı ve otomatik izlenmesini sağlayabilecek Hassas Hayvancılık Teknolojilerinin (PLF) geliştirilmesine yönelik çabalar artmaktadır (Dawkins vd. 2017; Pearce vd. 2023). Bu amaçla bilgisayar teknolojisi ve yapay zekâ tabanlı algoritmalara dayalı çeşitli otomatik izleme sistemleri geliştirilmiştir (Dawkins vd. 2013; Pereira vd. 2025). Bu sistemler arasında ivmeölçerlerin kullanıldığı sensör tabanlı otomatik ölçümler, bilgisayar görüntüleme tekniklerinin kullanıldığı optik akış analizleri ve kinetik analizler ile kızılötesi termografi **gibi yöntemler** öne çıkmaktadır (Kashiha vd. 2013; Weimer vd. 2019; Pearce vd. 2023). Bu teknolojiler kullanılarak broylerlerde topallık, davranış, beden sıcaklığı, aktivite ve bazı sağlık göstergelerinin izlenmesine yönelik çalışmalar yapılmaktadır. Bu alandaki ilerlemeler, kanatlı refahının izlenmesine yönelik daha güvenilir ve işletme koşullarına uyarlanabilir teknolojilere duyulan ihtiyacı **açık bir biçimde ortaya koymaktadır** (Aydin 2017; Okinda vd. 2020; Dawkins vd. 2012). Bu bildiride, broyler piliçlerde **ayak ve bacak sağlığı ile topallığın** değerlendirilmesinde kullanılan gözleme dayalı manuel yöntemler ile yenilikçi teknolojik yöntemler ele alınmış, konuya ilişkin güncel bilimsel gelişmeler özetlenmiş ve hassas hayvancılık uygulamalarına dayalı yeni yöntemlerin ticari koşullara uyarlanması ve doğrulanmasının, broyler piliçlerin refahını izleme ve üretim performansını **arttırmadaki potansiyel katkıları tartışılmıştır.**

2. METOT

Broyler piliçlerde bacak sağlığı ve yürüme fonksiyonunun değerlendirilmesini ele alan güncel hakemli bilimsel makaleler açık erişimli kaynakları kapsayacak şekilde taranmıştır. Bu kapsamda PubMed, Web of Science ve Google Scholar veri tabanlarından yararlanılmıştır.

Anahtar kelimeler arasında “broiler welfare”, “lameness”, “behavioral indicators”, “locomotor function”, “leg health” ve “assessment methods” yer almıştır. Sistematik tarama sonucunda incelenen çalışmalar, bacak sağlığı, topallık ve yürüme fonksiyonunun değerlendirilmesine ilişkin somut bulgular sunan, gözleme dayalı ve teknoloji tabanlı yöntemleri ayrı ayrı yada karşılaştırmalı biçimde ele alan araştırmalarla sınırlandırılmıştır. İncelenen bilimsel çalışmalardan elde edilen bulgular doğrultusunda, broyler piliçlerde bacak sağlığı ve yürüme fonksiyonunun değerlendirilmesinde kullanılan **gözleme dayalı yöntemler ile teknoloji tabanlı ölçüm yaklaşımları karşılaştırmalı olarak tartışılmıştır.**

3. BROYLERLERDE AYAK VE BACAK SAĞLIĞI İLE YÜRÜYÜŞÜN GÖZLEME DAYALI DEĞERLENDİRİLMESİ

Ayak tabanı ve diz eklemi yangısı, broyler piliçlerde ayak tabanı ve diz bölgesindeki derinin sert altlıkla uzun süre temas etmesi sonucu ortaya çıkan bir temas dermatitidir ve deri hasarına, iltihaplanmaya ve rahatsızlığa yol açar (Berg 2004; Kjaer vd. 2006; Meluzzi vd. 2008; Kwon vd. 2024). Bu **deri yangıları**, broyler üretiminde yaygın karşılaşılan ve ayak tabanı ile dizlerde ağrıya, iltihaba ve ülserasyona yol açan **temas dermatit türü lezyonlardır**. Özellikle piliçler nemli ve kirli altlık üzerinde uzun süre kaldığında bu lezyonlar daha da artar ve ciddi refah ve ekonomik sorunlara neden olur (Broom ve Reefmann 2005; Dawkins vd. 2009). Bu lezyonların yaygınlığı ve düzeyi hayvan refahının önemli göstergeleri olarak kullanılmakta ve bu değerlendirmeler genellikle **sürüyü temsil eden bir örneklem üzerinde** ve manuel olarak, **yoğun iş gücüyle** gerçekleştirilmektedir (Greene vd. 1985; Berg 2004; Haslam vd. 2007; de Jong vd. 2012; Dawkins vd. 2017; Liu vd. 2023; Kwon vd. 2024). Ayak tabanı yangılarının belirlenmesi ve şiddetinin değerlendirilmesi amacıyla Welfare Quality Kanatlı Refahı Değerlendirme Protokolünde yer alan standartlaştırılmış bir skorlama sistemi yaygın şekilde kullanılmaktadır (Welfare Quality 2009). Bu sistemde incelenen piliçlerin ayak tabanındaki lezyon durumu beş dereceli bir skala ile mukayase edilerek incelenmektedir (0: normal; 4: şiddetli ülserasyon ve inflamasyon) (Berg 2004; Heitmann vd. 2018). Bu değerlendirmede hayvanların ayak tabanındaki lezyonların yaygınlığı, şiddeti ve inflamasyonun düzeyi dikkate alınarak skorlama yapılmaktadır (Berg 2004; Heitmann vd. 2018; Liu vd. 2023; Kwon vd. 2024**).** Broyler piliçlerde refahın değerlendirilmesinde sıkça kullanılan diğer bir yöntem diz eklemi derisindeki yangı ve lezyonların incelenmesidir. Diz eklemi yangısının belirlenmesi ve lezyonların şiddetinin değerlendirilmesi için de yaygın olan yöntem Welfare Quality Kanatlı Refahı Değerlendirme Protokolü’nde standartlaştırılmış skorlama sistemin kullanılmasıdır. Diz eklemi yangısında da diz eklemi bölgesinde deri lezyonlarının durumu beş dereceli bir skala ile değerlendirilir (0: normal; 4: en şiddetli ülserasyon ve inflamasyon) (Welfare Quality 2009; Pereira vd. 2025). Ayak tabanı ve diz eklemi yangılarının şiddeti arttıkça, lezyon çevresindeki enfekte ve nekroze alanlar kızılötesi termografi (IRT) kullanılarak invaziv olmayan bir şekilde tespit edilebilir ve bu yöntem deri sağlığının değerlendirilmesinde kullanılabilmektedir (Wilcox vd. 2009; Weimer vd. 2019; Liu vd. 2023). Broylerlerde kas ve iskelet sistemi problemlerinin tespit edilmesi için kullanılan gözleme dayalı diğer bir değerlendirme yöntemi yürüyüş skorlamasıdır (Kestin vd. 1994; Reiter ve Bessei 1997; Butterworth, 1999). Yürüyüş skorlama sistemleri, hayvanlarda yürüyüş kalitesini ve topallık durumunu belirlemek amacıyla kullanılan değerlendirme yöntemleridir. Manuel yürüyüş skorlama yöntemi, genellikle en yaygın kullanılan yöntemdir (Silvera vd. 2017; Wurtz ve Riber 2024). Bristol Yürüyüş Skorlama Sistemi ve Welfare Quality® Protokolü, broyler piliçlerin bir gözlemci tarafından izlenerek yürüyüşlerinin 6 puanlı (0 puan: normal yürüyüş; 5 puan: yürüyemeyen hayvanlar) bir skala ile değerlendirilmesini sağlar ve bu yöntem altın standart olarak kabul edilir (Kestin vd. 1992; Hartcher ve Lum 2020; Wurtz ve Riber 2024). Saha koşullarında, kümesteki popülasyonu temsil edecek şekilde rastgele seçilen 100–150 hayvanlık

bir örneklemdeki tüm piliçler, tek bir gözlemci tarafından bireysel olarak izlenir ve yürüyüşün normal olup olmadığı ve var ise topallık durumunun derecesine göre skorlama yapılır (Kestin vd. 1992; Welfare Quality 2009; Liu vd. 2023). Altı puanlı yürüyüş skorlama yöntemi hızlı, ekipmansız ve geçerli bir değerlendirme sağlar, ancak değerlendiricilerin eğitimini ve uygulamanın düzenli kontrol edilmesi gerektirir. Ayrıca sürü veya işletmeler arasında gözlemciler arası güvenilirlik derecesi düşük olabilir ve hayvanların yürümeye zorlanması skorlama sırasında yanıltıcı sonuçlara neden olabilir (Mench 2004; Dawkins vd. 2004; Webster vd. 2008; Welfare Quality, 2009; Wurtz ve Riber 2024). Bristol Yürüyüş Skorlama Sistemi revize edilerek piliçlerin yürüyüşünün yukarıdan ve hayvan seviyesinden olmak üzere iki değerlendirici tarafından izlenmesi yönteme dahil edilmiştir (Garner vd. 2002). Broyler piliçlerde bacak sağlığının değerlendirilmesinde kullanılan invaziv olmayan yöntemler arasında hayvan davranışlarının gözlenmesine dayanan Yatmanın Gecikmesi Testi (Latency to Lie) bulunmaktadır (Weeks vd. 2002). Bu test, kanatlı hayvanların ne kadar süre ayakta kalabildiğini ölçerek yürüme yeteneğini değerlendiren, doğrulanmış ve nesnel bir davranışsal testtir. Testin suyun varlığı veya yokluğu, bireysel ya da grup halinde uygulanması ve bir kap içinde ya da kümes içinde sınırlama olmadan yapılması gibi çeşitli varyasyonları bulunmaktadır (Weimer vd. 2020; Wurtz ve Riber, 2024). Su kullanılarak yapılan test yönteminde, hayvanlar sığ suyla kaplanmış bir alana veya kap içerisine yerleştirmekte ve oturana kadar geçen süre kronometre ile ölçülmektedir (Weeks vd. 2002; Wurtz ve Riber 2024). Bacaklarında bir problem olmayan ve sağlıklı bacaklara sahip olan hayvanlar daha uzun süre ayakta kalabilirken, ağrısı veya topallığı olanlar kısa sürede yatmaktadır (Berg ve Sanotra 2003;Silvera vd. 2017). Yakalama stresini azaltmak amacıyla geliştirilen ve su kullanılmadan yapılan Yatmanın Gecikmesi Testi ise kümes ortamında yapılmakta ve yatan broyler piliçler arasından örneklemle belirlenenlere yaklaşılarak hafif bir uyarı ile ayağa kalkmaları teşvik edilmektedir. Hayvanın tekrar yere yatmasına kadar geçen süre kronometre ile ölçülerek onun ne kadar süre ayakta kaldığı belirlenmektedir. Bacakları sağlıklı ve güçlü olan piliçler daha uzun süre ayakta kalabilirken, ağrılı veya zayıf bacaklara sahip piliçler daha kısa sürede yatmaktadır (Bailie ve O'Connell 2014; Okinda vd. 2020).

4. BROYLERLERDE BACAK SAĞLIĞI VE YÜRÜYÜŞÜN TEKNOLOJİK DEĞERLENDİRİLMESİ

Sağlıklı bir broylerin belirli bir süre boyunca düzenli adımlarla kesintisiz şekilde yürümesi, iyi refahın temel göstergelerinden birisidir ve bu davranış **makineler tarafından görece kolay algılanabilmektedir** (Caspersen vd. 1985; Kleanthous vd. 2022; Dawkins 2024). Broylerlerde hızlı büyüme, artan vücut ağırlığı ve morfolojik değişiklikler, aktivitenin azalmasına ve bunun sonucunda yürüyüş bozukluklarının ortaya çıkmasına yol açabilmektedir (Bokkers ve Koene 2003; Pearce vd. 2023). Bu çerçevede ivmeölçer sensörler, adım frekansı, duruş değişiklikleri ve aktivite düzeyi gibi hareket parametrelerini kaydederek broylerlerde yürüme ve davranış örüntülerini izler ve topallığın erken ve objektif tespitini sağlar (Abeyesinghe vd. 2021; Pearce vd. 2023; Wurtz ve Riber 2024). Lokomotor dinamikleri kaydetmek için kullanılan vücuda takılan ivmeölçerler, hayvan aktivitesini izlemek amacıyla giderek daha fazla kullanılmakta olup, hayvan refahı ve hastalık izlemede zaman kazandıran, sürekli ve nesnel bir yöntem sunmaktadır (Brown vd. 2013; Abeyesinghe vd. 2021; Pearce vd. 2023; Wurtz ve Riber, 2024). Sensörlerin uygulanmasında iki temel yöntem bulunmaktadır. İlk yöntem, cihazın bir sırt çantası aracılığıyla hayvanın sırtına yerleştirilmesidir (Stadig vd. 2018; Dawson vd. 2021). İkinci yöntem ise sensörün doğrudan deriye, Hypafix® gibi bantlarla yapıştırılmasıdır (Nathan vd. 2012; Hall vd. 2016; Pearce vd. 2023). Manuel yapılan geleneksel yürüyüş skorlama yöntemi, öznel ve zaman alıcı olup genellikle az sayıda hayvanı kapsadığı için broylerlerin yaşam boyu refahını izlemede sınırlıdır (Mullan vd. 2009; Caplen vd. 2012). İvmeölçerler ise

bireysel düzeyde sürekli ve objektif veri sağlayarak topallığı erken ve hassas biçimde saptamayı mümkün kılabilir ve sensör ve video tabanlı otomatik sistemlerle birlikte kullanıldığında manuel değerlendirmenin kısıtlılıkları azaltır (Pearce vd. 2023; Wurtz ve Riber 2024). Kinetik analizler, piliçlerin yürüyüş sırasında ayaklarının yere uyguladığı kuvvet ve basıncı ölçerek yürüyüş yeteneği ve bacak sağlığını sayısal olarak değerlendirmeyi amaçlar. Bu analizlerde temel olarak ayak kuvvetleri ve basınç dağılımı, adım ve yürüyüş özellikleri incelenir (Nääs vd. 2010; Sandilands vd. 2011; Wurtz ve Riber 2024). Ölçümler, yürüyüş yoluna gömülü kuvvet plakaları veya piezoelektrik sensörler aracılığıyla gerçekleştirilir. Piliçler yürüyüş yoluna yerleştirilir ve doğal veya yönlendirilmiş yürüyüşleri sırasında sensörler ilgili verileri kaydeder (Nääs vd. 2010; Sandilands vd. 2011; Fodor vd. 2025). Kinetik analizler, bacak veya ayaktaki ağrı ile iskelet ve kas dokularındaki sorunlar nedeniyle beden ağırlığın bacaklar üzerinde taşınmasına ilişkin değişiklikleri tespit ederek topallığı belirler (Nääs vd. 2010; Okinda vd. 2020; Wurtz ve Riber 2024). Topallık genellikle ayak kuvvetlerinde asimetri, maksimum dikey kuvvet değişiklikleri, yürüyüş hız ve adım özelliklerindeki değişiklikler ve ayak tabanı basınç dağılımındaki farklılıklarla ortaya konmaktadır (Corr vd. 2003; Nääs vd. 2010; Sandilands vd. 2011; Silvera vd. 2017). Bilgisayarlı görüntüleme yöntemleri kapsamında kullanılan o**ptik akış**, broylerlerin yürüme yeteneği, topallık ve duruş değişimlerini video üzerinden otomatik olarak izleyen bir yöntemdir. Optik akış **b**ireylerin sürekli takip edilmesine olanak sağlar ve en az veri ile yürüyüş skorları hakkında bilgi verir. Optik akış desenlerinin çarpıklık ve basıklığı zayıf yürüyüş yeteneğiyle ilişkilidir **(**Dawkins vd. 2012; Dawkins vd. 2013; Okinda vd. 2020; Wurtz ve Riber 2024). Grup düzeyinde elde edilen desenler, anormal yürüyen broyler oranı ve genel bacak sağlığı sorunlarıyla korelasyon göstermektedir (Dawkins vd. 2012; Pearce vd. 2023; Pereira vd. 2025). Böylece optik akış, hem birey hem de grup düzeyindeki refah sonuçlarını dolaylı biçimde yansıtan, ucuz ekipmanla sürekli ve otomatik veri üretebilen müdahalesiz bir ölçüm yöntemi olarak öne çıkmaktadır. (Dawkins vd. 2009; Dawkins vd. 2017; Pearce vd. 2023**)**. Özellikle sürü yaşamının ilk iki haftasında elde edilen optik akış desenleri, ilerleyen haftalardaki mortalite ve diz eklemi yangısı prevalansı gibi temel refah göstergeleriyle anlamlı şekilde ilişkili bulunmuştur (Pereira vd. 2025). Bu da yöntemin erken uyarı amacıyla kullanılabileceğini ve farklı çevre ile yönetim koşullarında bile ticari kullanım potansiyeline sahip olduğunu göstermektedir (Dawkins vd. 2021; Wurtz ve Riber ve 2024; Pereira vd. 2025).

5. SONUÇ VE ÖNERİLER

Bu çalışmada incelenmiş bilimsel araştırmalarda sunulan bilimsel gelişmelerden yola çıkarak ulaşılan sonuçlar ve öneriler özetle aşağıda sunulmuştur:

- Broyler piliçlere bacak sağlığı ve refahı artırmak için uygun besleme, barınma koşulları ve refahı destekleyen yönetim uygulamaları sağlanmalıdır. Ayrıca, piliçlerde bacak problemlerinin oluşumu önlenmeli ve topallık ile diğer sağlık sorunlarının gelişmemesi için düzenli izleme yapılmalıdır.

- Broylerlerde refahın izlenmesi, geleneksel yöntemlerin yanı sıra kamera ve bilgisayar tabanlı tekniklerle desteklenmelidir. Özellikle sürü ve bireysel düzeyde davranış, hareketlilik ve sağlık takibi için mevcut sürü yönetim sistemlerine, optik akış gibi bilgisayarlı görüntüleme yöntemleri entegre edilmelidir.

- Gelecek dönemde yapılacak çalışmalar, hassas hayvancılık uygulamalarının broyler genotiplerine özgü davranış analizleri ile farklı barındırma sistemleri dikkate alınarak, doğruluk ve güvenilirliği artıracak şekilde ticari koşullara uyumlu hâle getirilmelidir. Elde edilen veriler, modern kanatlı üretiminde hayvan refahı, sürdürülebilirlik, genomik ıslah ve yönetim stratejilerinin geliştirilmesinde etkin bir şekilde kullanılabilir.

ÖZET

Broyler eti üretimi, dünya genelinde en hızlı büyüyen hayvansal protein sektörüdür. Bu nedenle diğer çiftlik hayvanlarına göre çok daha fazla sayıda broyler yakalanmakta, taşınmakta ve kesilmektedir. Taşınmak üzere hayvanların yakalanıp nakil ünitelerine yerleştirilmesi, hayvana temas edilmesi ve alışılmadık çevresel koşullar piliçlerde akut strese neden olmaktadır. Piliç yakalama işlemi, kesim öncesi üretim zincirinin en hassas aşamalarından biridir ve hayvan refahı ve karkas kalitesi açısından büyük öneme sahiptir. Manuel yakalamada, genellikle çalışanlar piliçleri bacaklarından tutularak, başları aşağıda olacak şekilde taşıma kasa veya modüllerine yerleştirir. Mekanik yakalamada ise piliçler el değmeden kümes zemininden toplanıp taşıma kasa veya modüllerine aktarılırlar. Her iki yakalama yönteminin meydana gelen hayvan stresi ve karkas kayıpları bakımından etkileri farklılık göstermektedir. Piliçlerin uygun şekilde yakalanmaması sonucu ortaya çıkan kanat ve bacak kırıkları, morluklar ve deri sıyrıkları gibi lezyonlar karkas reddine ve ekonomik kayıplara neden olmaktadır. Ayrıca, piliçlerin yakalanması ve yüklenmesi görevli personel açısından önemli ölçüde ergonomik zorluklar ve iş güvenliği riskleri içermektedir. Bu nedenle, piliç yakalamada kullanılacak yöntemin, hayvan refahı, çalışan sağlığı ve ekonomik etkiler arasında hassas bir dengeyi sağlaması gerekir. Broyler endüstrisi, genetik seleksiyonlar, hayvan refahı gereklilikleri, tüketici baskısı ve hassas teknoloji alanındaki yeniliklerin etkisiyle önemli bir yapısal dönüşüm sürecine girmiştir. Bu bildiride broyler piliçleri yakalamak için kullanılan yöntemlerin hayvan refahı, karkas kalitesi, ergonomik ve ekonomik sonuçlar üzerindeki etkilerine ilişkin en güncel bilimsel gelişmeler özetlenmiş, yakalama yöntemleri hayvan refahı, çalışan sağlığı ve çiftçi geliri arasında hassas bir denge sağlama potansiyeli bakımından tartışılmıştır.

Anahtar Kelimeler: Broyler Piliç, Hayvan Refahı, Karkas Kalitesi, Yakalama Yöntemi

THE EFFECTS OF CATCHING METHODS ON BROILER WELFARE AND CARCASS QUALITY

ABSTRACT

Broiler production is currently the fastest growing sector of the animal protein industry worldwide. Consequently, a much larger number of broilers are captured, transported and slaughtered than other farm animals. The process of handling birds for transport, including capturing them and placing them in crates for transportation, as well as their exposure to unusual environmental conditions, can induce acute stress. The process of catching the animal is one of the most critical stages in the chain of events that take place before slaughter, and it is of great importance for both the animal welfare and the quality of the carcass. In manual catching, birds are grasped by the legs and load them into trasport crates or modules while the birds are held upside down. In contrast, in mechanical catching, birds are collected from the floor without direct human contact and transferred into conveyor systems and into crates. These two methods differ in terms of the animal stress they induce and the resulting carcass losses. Improper catching practices can lead to lesions such as wing and leg fractures, bruising and skin abrasions, which increase carcass condemnation rates and cause economic losses. In addition, broiler catching and loading tasks present considerable ergonomic challenges and occupational safety risks for personnel. The choice of catching method must carefully balance animal welfare, worker safety and financial outcomes. The broiler industry has undergone significant structural changes in recent years due to genetic selection, animal welfare requirements, consumer demands and the adoption of precision technologies. This paper summarises the latest scientific research on the impact of broiler catching methods on animal welfare, carcass quality, ergonomics and economic performance. It also discusses how different catching techniques could help to strike a balance between animal welfare, worker health and safety, and farm profitability.

Keywords: Broiler Chicken, Animal Welfare, Carcass Quality, Catching Method

1. GİRİŞ

Küresel gıda talebinin artması, kanatlı sektörünün büyümesini hızlandırmıştır ve çiftlikten kesimhanelere taşınan tavuk sayısını oldukça çok arttırmıştır (Delezie vd. 2005; Dutra vd. 2021; Delanglez vd. 2025). Kümes veya kafes içinde yetiştirilen tavukların yakalanması ve ele alınması, nakil kasa veya modüllerine yerleştirilmesine kadar geçen yakalama ve taşıma süreci stres, yaralanma ve ölüm riskine yol açabilmektedir (Kittelsen vd. 2018; Wolf vd. 2019; Delanglez vd. 2025). Bu süreçteki işlemlerin operasyonel verimliliğinin hayvan refahı ve ekonomik çıktılar üzerindeki etkisi çok önemlidir (Cockram vd. 2020; Weeks vd. 2024).

Piliç yakalama manuel veya mekanik olarak gerçekleştirilebilirken birçok ülkede yakalama işlemi hâlâ büyük ölçüde manuel yöntemlere ve özellikle baş aşağı yakalama yöntemine dayanmaktadır (Delezie vd. 2006; Langkabel vd. 2015; Beňo vd. 2021). Ancak baş aşağı yakalama yöntemi hayvan refahı açısından önemli sorunlar meydana getirmektedir (Delezie vd. 2006; Beňo vd. 2021; Nielsen vd. 2022). Ayrıca farklı yakalama yöntemlerinin hem çiftlik ekonomisi hem de hayvan refahı üzerine değişen ölçülerde etki yapabileceği bildirilmektedir (Jacobs vd. 2017; Kittelsen vd. 2018; Cockram vd. 2020; Delanglez vd. 2024b).

Yakalama süreci çalışanlar açısından kümes içi zorlu çevre koşulları, fiziksel zorlanma ve yorgunluk, yaralanma riski ve artan iş yükü nedeniyle önemli bir iş sağlığı ve güvenliği sorunu oluşturmaktadır (Nijdam et al., 2004; Delezie ve ark., 2006; Dutra vd. 2021; de Lima vd. 2019). Son yıllarda geliştirilen mekanik yakalama sistemleri, iş gücünü azaltma ve hayvanlarda oluşan stresi sınırlama potansiyeli nedeniyle sektörde giderek daha fazla önem kazanmaktadır. (Duncan vd. 1986; Dutra vd.2021; Delanglez vd. 2025). Hangi yakalama yönteminin tercih edileceği, çoğunlukla hayvan refahı, çalışan ergonomisi ve çiftlik ekonomisi arasındaki dengenin kurulmasına bağlıdır. Bununla birlikte, broylerlerde baş aşağı, dik ve mekanik yakalama yöntemlerini karşılaştıran çalışmalar sınırlı olup, bu kapsamda hayvan refahı daha fazla incelenmiş ancak ergonomik ve ekonomik etkilere ilişkin çalışmalar oldukça azdır (Lacy ve Czarick, 1998; Kittelsen vd. 2018; Delanglez vd. 2024b).

Bu bildirinin amacı, broyler piliçlerin nakil öncesinde yakalanması ve taşıma ünitelerine yerleştirilmesi sürecine odaklanarak literatürde mevcut bilimsel verilerin sistematik biçimde incelenmesi, yakalama yöntemlerinin hayvan refahı, karkas kalitesi, çalışan sağlığı ve ekonomik çıktılar üzerindeki etkilerini bütüncül olarak değerlendirilmesidir. Bu bildiride **broyler piliçleri yakalamak için kullanılan yöntemlerin hayvan refahı, karkas kalitesi, ergonomik ve ekonomik sonuçlar üzerindeki etkilerine ilişkin en** güncel bilimsel gelişmeler özetlenmiş, yakalama yöntemleri hayvan refahı, çalışan sağlığı ve çiftçi geliri arasında hassas bir denge sağlama potansiyeli bakımından tartışılmış ve yeni nesil yakalama sistemlerinin geliştirilmesi sürecinde sektör paydaşlarına yönelik öneriler sunulmuştur.

2. METOT

Broyler endüstisinde kullanılan piliç yakalama yöntemlerinin etkilerini araştıran bilimsel çalışmalar incelenmiştir. Literatür taraması, 1985–2025 yılları arasında yayımlanan hakemli bilimsel makaleler ve açık erişimli kaynakları kapsayacak şekilde Web of Science, PubMed ve Google Scholar üzerinden gerçekleştirilmiştir. Araştırmada “broiler catching”, “manual vs mechanical catching”, “pre-transport stress”, “animal welfare” “ergonomic” “carcass quality” ve “economic outcomes” anahtar kelimeleri kullanılmıştır. Seçilen çalışmalar, piliç yakalama yöntemlerinin **hayvan refahı, karkas kalitesi, ergonomik ve ekonomik sonuçlar** üzerine etkileri karşılaştırmalı olarak değerlendirmiştir.

3. TAŞIMA ÖNCESİ BROYLER YAKALAMA YÖNTEMLERİ

3.1. Manuel Yakalama

Manuel yakalama sırasında çalışanlar her bir elinde genellikle 3 veya 4 broyler pilici bacaklarından kavrayarak taşır ve hayvanlar bu süreç boyunca baş aşağı pozisyonda kasa ve modüllere yerleştirilir (Langkabel vd. 2015; Gerritzen vd. 2022; Wessel vd. 2022; Weeks vd.2024). Saha koşullarında en yaygın manuel yakalama yöntemi baş aşağı yakalamadır. Bu yöntemde işte uzmanlaşmış profesyonellerin bulunduğu yakalama ekipleri piliçleri bacaklarından tutulup baş aşağı sarkıtılarak taşırlar (Beňo vd. 2021; Gerritzen vd. 2022; Delanglez vd. 2025). Taşıma ekibinin tavuğu tek bir bacağından kavraması durumunda yöntem tek bacaktan yakalama, tek eliyle iki bacağı birden kavraması durumunda ise iki bacaktan yakalama olarak sınıflandırılır. Manual yöntemde piliçler bir veya iki bacaklarından tutulur, baş aşağı taşınır ve daha sonra taşıma modüllerine yerleştirilerek araçlara yüklenir (Nielsen vd. 2022; Delanglez vd. 2025). Avrupa Birliği'nin Nakil Yönetmeliği'ne (Regulation (EC) No 1/2005) göre uygun olmamakla birlikte, piliçlerin tek bacaktan yakalanmasına dayalı yakalama uygulamalarına halen rastlanmaktadır (Council of the European Union 2005; Nielsen vd. 2022; Delanglez vd. 2004a; Delanglez vd. 2025). Baş aşağı taşıma, tek seferde daha fazla piliç taşımaya olanak tanıdığı için iş verimliliğini artırdığı ve nakil maliyetini düşürdüğü için daha fazla tercih edilmektedir (Langkabel vd. 2015; Nielsen vd. 2022; Delanglez vd. 2024b).

Manuel yakalamanın bir diğer yöntemi olan dik pozisyonda yakalamada, yakalayıcı tavuğu başı doğal konumunda yani yukarıya ve hafifçe öne doğru bakacak şekilde tutar. Tavuğun gövdesi dik pozisyona getirilir ve yakalayıcı, bir eliyle karın bölgesinin altından destek verirken diğer eliyle kanatların üzerinden kavrayarak hayvanı kendi vücuduna doğru sabitler (Kittelsen vd. 2018; de Lima vd. 2019; Gerritzen vd. 2022).

Dik pozisyonda yakalama yönteminde aynı anda iki piliç yan yana ve dengeli bir şekilde taşınabilir. Yakalayıcının her iki eli de piliçlerin göğüs altına yerleştirilir, parmakları kanatların üzerinden geçerek kanatları tavuğun gövdesine yaslar ve sabitler. Böylece piliçlerin kanat çırpmasının önüne geçilir, hayvan taşınırken dengede kalır ve hem tavuğun hem de yakalayıcının yaralanma riski azaltılmış olur (Mönch vd. 2020; Gerritzen vd. 2022; Weeks vd. 2024; Delanglez vd. 2024a). Baş aşağı yakalamaya göre bu yöntem her bir yakalama işleminin daha kısa sürede yapılmasına olanak tanır ancak tüm sürünün yakalanması için gerekli toplam süre daha uzun olmaktadır (Kittelsen vd. 2018; Delanglez vd. 2024b). Dik yakalama yöntemi stres ve yaralanmaları azaltabilmekte ancak yakalayıcılar açısından %70 daha fazla iş gücü gerektirmekte ve daha yorucu olmaktadır. Bu nedenle dik yakalama yönteminin baş aşağı yakalamaya göre 1.5 kat, mekanik yakalamaya göre ise 1.2 kat daha maliyetli olduğu bildirilmiştir (Langkabel vd. 2015; Kittelsen vd. 2018; Delanglez vd. 2024b; Dalengez vd. 2025).

3.2. Mekanik Yakalama

Mekanik yakalama, broyler piliçleri elle tutmak yerine çeşitli makinelerle yakalayıp taşıma kasa ve modüllerine yerleştirme işlemidir. Mekanik yakalama, insanlar ile hayvanlar arasındaki doğrudan teması sınırlandırılmış olur (Lacy ve Czarick 1998; Weeks vd. 2024). Zorlayıcı ve zorlayıcı olmayan şeklinde iki tip mekanik yakalama bulunmaktadır (Nijdam vd. 2005; Wolff vd. 2019; Delanglez vd. 2025). Bu makineler, pnömatik veya vakum sistemleriyle piliçleri yerden kaldıran, konveyörlerle toplayan ya da birden fazla hayvanı aynı anda yakalayabilen kombine sistemlerden oluşur (Lacy ve Czarick, 1998; Nijdam vd. 2005; Wolff vd. 2019; Mönch ve ark. 2020). Zorlayıcı (forced) yakalama sistemlerinde piliçler, döner mekanizmalar üzerine yerleştirilmiş ve hayvanlara zarar vermeyecek şekilde tasarlanmış yumuşak, esnek

kauçuk parmaklar aracılığıyla kavranarak toplanır. Bu kauçuk parmaklar, piliçleri nazikçe yakalayıp belirli bir yöne doğru sürerek bir araya toplar, piliçle temas ettiğinde onu nazik ama kontrollü bir şekilde kavrar, böylece hayvan yere bastırılmadan veya sert bir şekilde çekiştirilmeden toplama hattına ve taşıma modüllerine doğru yönlendirilir. **Zorlayıcı olmayan mekanik yakalama sistemlerinde** ise piliçler herhangi bir **fiziksel kavrama, sıkıştırma ya da tutma işlemine maruz bırakılmaksızın** bir konveyör bant üzerinde dik pozisyonda taşınır. Bu sistemlerde piliçlerin doğal hareketlerini destekleyerek onların **kendi adımlarıyla** konveyör yüzeyine geçmelerini sağlayan, **geniş ve yumuşak zeminli özel konveyör bantlar bulunmaktadır**. Makine, piliçlerde stres oluşturmadan yönlendirmek amacıyla genellikle **alttan veya yandan düşük şiddetli bir yönlendirme** uygular. Piliçler, herhangi bir baskı veya zorlamaya maruz kalmadan konveyöre geçtikten sonra bant sistemi tarafından **dik pozisyonda** taşınarak taşıma modüllerine sevk edilirler (Ramasamy vd. 2004; Made in China 2005; Nijdam vd. 2005; Wolff vd. 2019; Šemrov ve Bedenik 2025; Peer System 2025; Delanglez vd. 2025)

Mekanik yakalama için çeşitli sistemler geliştirilmiştir (Knierim ve Gocke, 2003; Nijdam vd. 2005). Apollo Generation 1 ve Anglia Autoflow gibi basit mekanik yakalama sistemleri, broylerleri konveyör bantlar, dönen parmaklar ve pnömatik veya vakum sistemlerini içerirler ancak bazı basit modeller hâlen manuel müdahale gerektirmektedir (Knierim ve Gocke 2003; Ramasamy vd. 2004; Nijdam vd. 2005). Gelişmiş sistemlerde ise mekanik kollar, yüksek kapasiteli konveyörler ve yumuşak hava akışı gibi yeni teknolojiler kullanılmaktadır, piliçler dik pozisyonda ve el değmeden taşınmakta ve böylece stres ve yaralanma riski azaltılmaktadır (Nijdam vd. 2005; Mönch vd. 2020; CMC Industries 2025). Diğer gelişmiş otomatik yakalama makineleri ise (Peer System Catching Machine ve Chicken Cat Harvester, vs.) dönen kauçuk parmaklar, esnek konveyörler, modüler toplama üniteleri ve mekanik olarak yakalanan piliçleri toplayarak modüller veya treylerli kamyonlara aktaran otomatik taşıma sistemleri ile entegre şekilde çalışmaktadır (Knierim ve Gocke 2003; Mace ve Knight 2022; CMC Industries 2025; Peer Sysstem 2025).

Yeni nesil otomatik ve robotik sistemler bilgisayarlı görüş ve sensör teknolojisiyle piliçlerin yakalanması, taşınması ve taşıma modüllerine yerleştirilmesi işlemini robotik kollar, bilgisayarlı görüş altyapısı ve entegre konveyör sistemleri aracılığıyla **tamamen otomatik olarak gerçekleştirilebilmektedir.** Bu yeni sistemlerde tüm işlemlerin personel müdahalesinin en aza indirilerek hassas bir biçimde yönetildiği ve **hayvan refahının en üst düzeyde korunmasının mümkün olduğu bildirilmektedir** (Made in China, 2005; Beňo vd. 2021).

4. YAKALAMA YÖNTEMİNİN ETKİLERİ

4. 1. Hayvan Refahı Üzerine Etkiler

Yakalama ve yükleme işlemleri, ticari kanatlıların yaşamındaki en stresli dönemlerden birisidir ve hayvan refahı açısından önemli riskler içermektedir (Wolff vd. 2019; Delanglez vd. 2024a; Dutra vd. 2021). Manuel yöntemlerden dik pozisyonda yakalamaya göre, piliçlerin bacaklarından tutularak baş aşağı yakalanması daha fazla sayıda piliç taşımayı kolaylaştırmakta ise de hayvan stresini arttırmaktadır (Jones 1992; Jacobs vd. 2017; Kittelsen vd. 2018; Mönch vd. 2020; Smith ve Pierdon, 2025). Broyler piliçlerde ideal manuel yakalama yöntemi baş dik pozisyonda, kanatlar kapalı şekilde ve iki elle hayvanın gövdesinden kavrayarak yapılır. Büyük işletmelerde bu mümkün değilse, piliçler iki bacaktan yakalanmalı ve tek elde en fazla 3 hayvan olmalıdır (**Humane Slaughter Association, 2011;** Warin vd. 2019; Nielsen vd. 2022; Wessel vd.2022). Tek bacaktan baş aşağı yakalamanın bacak eklemlerine aşırı yük binmesine neden olduğu, piliçlerin can acısıyla ve korkuyla çırpınması sonucu kemik ve eklemlerde hasarların arttığı, hayvanlarda stres, ağrı ve ızdırabın meydana

geldiği ortaya konmuştur (Langkabel vd. 2015; Hassan ve Lashin, 2017; Mönch 2020; Dutra vd. 2021; Nielsen vd. 2022).

Mekanik yakalamada, insan teması olmadığı için piliçlerde korku tepkilerinin ve yaralanma oranlarının daha az olduğu bildirilmiştir (Hassan ve Lashin, 2017; Wolff vd.2019; Dutra 2021; Smith ve Pierdon 2025). Mekanik piliç hasat makinaları ile konteynerlerdeki hayvan yoğunluğu broyler piliçlerin canlı ağırlığına göre ayarlanabilir ve bu özellik piliç refahının arttırılmasına katkı yapabilir (Wolff vd. 2019;Mönch vd. 2020). Ancak bu yöntemde yakalama işlemleri daha yavaş olduğundan, özellikle hava sıcaklığının yüksek olduğu dönemlerde uzun süreli yakalama işlemlerinin hayvanlarda stresi arttırdığı ve nakil sürecinde öldüğü belirlenen hayvan oranının yükselmesine neden olduğuna ilişkin bildirimler bulunmaktadır (Duncan vd. 1986; Knierim ve Gocke 2003; Delezie vd. 2006; Hassan ve Lashin 2017; Mönch vd. 2020; Weeks vd. 2024).

4.2. Karkas Kalitesi Üzerine Etkiler

Yakalama sırasında meydana gelen yaralanmalar karkas kalitesini düşürmektedir. Manuel yakalamada özellikle kanat kırıkları, kanat hematomları ve bacak yaralanmaları sık görülmekte olup tek bacaktan yakalama ve baş aşağı taşıma yöntemleri bu tür kemik kırıkları, morarma ve deri altı hematom riskini daha da artırmaktadır (Lacy ve Czarick 1998; Jacobs vd. 2017; Kittelsen vd. 2018; Dutra vd. 2021;Wessel vd. 2022; Delanglez vd. 2025). Gövde, kanat ve bacaklardaki yaralanmalar ve hasarlar karkas reddine ve dolayısıyla önemli ekonomik kayıplara neden olmaktadır (de Lima vd. 2019; Wolff vd. 2019; Delanglez vd. 2024b; Delanglez vd. 2025).

Mekanik yakalamaya bağlı yaralanma riskine ilişkin çalışmalar oldukça sınırlıdır. Genel olarak gövde ve bacak yaralanmalarının daha az olduğu ancak kanat ucu hematomları ile nakil sürecinde meydana gelen ölümlerin daha yüksek olduğu bildirilmiştir. Operatör deneyimi arttıkça otomatik yakalama sistemlerinde kanat hematomları oranı, karkas kusurları ve refah kayıplarının azaltılabileceği değerlendirilmektedir (Lacy ve Czarick 1998; Nijdam vd. 2005; Wolff vd. 2019; Mönch vd. 2020; Nielsen vd. 2022; Smith ve Pierdon, 2025; Delezie vd. 2005).

4.3. Ergonomik ve Ekonomik Etkiler

Yakalama işleminin, piliçlerin yakalanmasında görevli personelin sağlığını ve güvenliğini etkilediği bildirilmektedir. Manuel yakalamanın hem fiziksel hem de zihinsel olarak zorlayıcı olduğu, yakalayıcılarda bel, omuz ve kol yaralanmalarına yol açabildiği görülmektedir. Ayrıca yüksek amonyak, toz ve nem gibi kümes koşulları çalışan sağlığını olumsuz etkilemektedir (Mora vd. 2016; Kittelsen vd. 2018; Delanglez vd. 2025). Yorgunluk, piliçlerin yakalanması sırasında yakalayıcı personelin dikkat ve özenini sürdürmesini zorlaştırarak piliç refahını olumsuz etkilemektedir (Langkabel vd. 2015; de Lima vd. 2019). Tek bacaktan yakalama, daha hızlı olmasına rağmen iş gücü açısından yorucudur ve ergonomik riskleri artırır. Dik yakalama daha ergonomik olsa da personelin daha fazla efor sarf etmesini gerektirir ve toplam iş süresini uzatarak süreci daha yorucu hale getirebilir (Kittelsen vd. 2018; de Lima vd. 2019, Delanglez vd. 2024a). Bununla birlikte manuel yakalama yapan personelin yakalanan piliçlerin kaçma veya direnme davranışlarını gözlemleyebileceği için tutuş tekniğini anlık olarak ayarlayarak piliç refahının arttırılmasına katkı yapabileceği bildirilmektedir (Dutra vd. 2021; Mönch vd. 2020).

Mekanik yakalama, yüksek başlangıç yatırımı gerektirmektedir ancak yakalayıcıların piliçlerle doğrudan temasını ve fiziksel olarak zorlanmasını azaltması nedeniyle personel sağlığının korunmasına daha uygun olduğu ve özellikle iş gücünün temininin zor veya pahalı olduğu bölgelerde avantaj sağladığı bildirilmektedir (Nijdam vd. 2004; Wolff vd. 2019; de Lima vd.

2019; Delanglez vd. 2025). Yakalayıcı personelin sağlığı ve ergonomik açıdan dik manuel yakalama ve mekanik yakalama yöntemlerinin baş aşağı veya tek bacaktan manuel yakalamaya göre ve özellikle uzun vadede daha avantajlı olduğu bildirilmiştir (Kittelsen ve ark., 2018, Dutra vd. 2021; Gerritzen vd. 2022; Delanglez vd. 2025).

5. SONUÇ VE ÖNERİLER

Bu çalışmada sulunun bilimsel gelişmelerden çıkarılan sonuç ve öneriler özetle aşağıda sunulmuştur:

- Hayvan refahı ve sağlığının daha iyi olması, yakalamaya bağlı ekonomik kayıpların azaltılabilmesi için en uygun manuel yöntemin dik pozisyonda ve iki bacağından desteklenerek yakalama olduğu anlaşılmaktadır. Baş aşağı taşıma yalnızca zorunlu olduğu koşullarda ve ancak piliçler her iki bacağından yakalanıp gövdesine destek sağlanarak yapılmalıdır.

- Mekanik yakalamaya ilişkin yakın zamandaki araştırmalar bu yöntemin piliç refahı, personel güvenliği ve iş verimliliği açısından önemli avantajlar sağlayabileceğini göstermektedir. Ancak, yeni nesil hasat makinelerinin kullanımıyla oluşan kanat yaralanmaları ve hayvan ölümlerinin azaltılması bakımından hataların en aza indirilmesi için operatörlerin eğitilmesi ve kümeslerin mekanik yakalama sistemleriyle uyumlu hale getirilmesi önemlidir.

- Seçilecek olan yakalama yöntemi yüksek verimlilikte ve operasyonel planlama ile uyumlu olmalıdır. Hızlı veya aceleyle yapılan yakalama işlemi piliçlerde yaralanma ve stres riskini artırırken uzun süren yakalamalar da hayvan refahını olumsuz etkileyebilmektedir.

- Piliç refahı, karkas kalitesi, ekonomik kayıp ve personel güvenliğine ilişkin riskler sadece yakalama yöntemiyle ilişkilendirilemez, çevresel ve genetik faktörlerin de etkileri dikkate alınmalıdır. Bu nedenle mevcut koşullara en uygun yakalama yöntemi seçilmelidir. Manuel yakalama ve yeni nesil otomatik hasat makinelerinin hayvanlar ve çalışanlar üzerindeki etkilerine ilişkin mevcut bilgiler halen yetersizdir. Gelecek dönemlerde geliştirilecek yeni genetik hatlar da dikkate alınarak, yakalama yöntemlerini mukayeseli ve saha koşullarında inceleyen daha fazla araştırmaya ihtiyaç bulunmaktadır.

ÖZET

Sığır eti, hem Türkiye'de hem de dünya genelinde yaygın olarak tüketilen bir gıda olup zoonotik bakteriyel patojenlerin taşınması açısından önemli bir risk grubudur. Bu patojenler arasında *Salmonella spp.* ve Shiga toksinjenik *Escherichia coli* (STEC), ciddi akut gastroenterit vakaları, hemolitik üremik sendrom (HÜS) ve gıda kaynaklı salgınlarla ilişkilendirilen en kritik etkenler arasında yer almaktadır. Bu derlemenin amacı, dünya genelinde ve Türkiye'de sığır eti ve kıyma ürünlerinde *Salmonella spp.* ile Shiga toksin üreten *Escherichia coli* (STEC) varlığına ilişkin güncel literatürü incelemek, prevalans düzeylerini karşılaştırmak ve antimikrobiyal direnç profillerini değerlendirmektir. Ayrıca bu patojenlerin halk sağlığı açısından oluşturduğu riskler ile küresel antimikrobiyal direnç sorunu kapsamındaki önemini ortaya koymak hedeflenmiştir. 2000–2024 yılları arasında yayımlanmış bilimsel çalışmalar için PubMed, Scopus, Web of Science, Science Direct, Google Scholar ve ulusal veri tabanları taranmıştır. Arama stratejisinde "*Salmonella*, *STEC*, *E. coli O157:H7*, beef, ground beef, minced meat, prevalence, antimicrobial resistance, meat safety" gibi anahtar kelimeler kullanılmıştır. Dahil edilen çalışmalar kültür yöntemleri, PCR tabanlı analizler, serotiplendirme ve antimikrobiyal duyarlılık testlerine dayanan bulgular içermektedir. Literatürde *Salmonella spp.* prevalansının ülkeler arasında büyük farklılık gösterdiği; Etiyopya (%12,5), Meksika (%41,7), Senegal (%63) gibi yüksek oranların yanında Namibya gibi bölgelerde oranların %1'in altında olduğu görülmüştür. Türkiye'de kıyma ve köfte örneklerinde *Salmonella* pozitifliği %3–24 arasında bildirilmiştir. STEC prevalansı %2–44 arasında değişmekte, bazı çalışmalar *E. coli* O157:H7 oranlarını %10'a kadar göstermektedir. Birçok çalışmada tetrasiklin, ampisilin, streptomisin ve sefalosporinlere karşı yüksek düzeyde çoklu ilaç direnci saptanmıştır. Sığır eti ve kıyma ürünleri, hem *Salmonella spp.* hem de STEC açısından önemli bir kontaminasyon kaynağı olup, bu patojenler küresel ölçekte ciddi bir halk sağlığı tehdidi oluşturmaktadır. Prevalansın yüksekliği ve MDR suşların yaygınlığı, üretim zinciri boyunca hijyen uygulamalarının geliştirilmesi, etkili sürveyans programlarının güçlendirilmesi ve antimikrobiyal dirençle mücadele stratejilerinin önceliklendirilmesi gerekliliğini ortaya koymaktadır.

Anahtar Kelimeler: Sığır eti, *Salmonella,* STEC, Antimikrobiyal direnç.

THE RISK OF *Salmonella* spp. AND SHIGA TOXIGENIC *Escherichia coli* (STEC) IN RAW BEEF SAMPLES

ABSTRACT

Beef is a widely consumed food both in Türkiye and worldwide and represents a significant risk group for the carriage of zoonotic bacterial pathogens. Among these pathogens, *Salmonella* spp. and Shiga toxin-producing *Escherichia coli* (STEC) are among the most critical agents associated with serious acute gastroenteritis cases, hemolytic uremic syndrome (HUS) and foodborne outbreaks. This review aims to examine the current literature on the presence of *Salmonella* spp. and Shiga toxin-producing *Escherichia coli* (STEC) in beef and ground-meat products worldwide and in Türkiye, to compare prevalence levels and to evaluate antimicrobial resistance profiles. It also aims to highlight the public-health risks posed by these pathogens and their significance within the global antimicrobial resistance problem. Scientific studies published between 2000 and 2024 were searched in PubMed, Scopus, Web of Science, Science Direct, Google Scholar and national databases. The search strategy used keywords such as "Salmonella," "STEC," "E. coli O157:H7," "beef," "ground beef," "minced meat," "prevalence," "antimicrobial resistance" and "meat safety." The studies included contain findings based on culture methods, PCR-based analyses, serotyping and antimicrobial susceptibility tests. The literature shows that the prevalence of *Salmonella* spp. varies greatly between countries: high rates have been observed in Ethiopia (12.5 %), Mexico (41.7 %) and Senegal (63 %), while regions such as Namibia reported rates below 1 %. In Türkiye, Salmonella positivity in minced meat and meatball samples has been reported between 3 % and 24 %. STEC prevalence ranges from 2 % to 44 %, with some studies showing *E. coli* O157:H7 rates up to 10 %. Many studies have detected a high level of multidrug resistance against tetracycline, ampicillin, streptomycin and cephalosporins.Beef and minced-meat products are an important source of contamination for both *Salmonella* spp. and STEC, and these pathogens pose a serious public-health threat on a global scale. The high prevalence and widespread presence of MDR strains highlight the need to improve hygiene practices throughout the production chain, strengthen effective surveillance programs and prioritize strategies to combat antimicrobial resistance.

Keywords: Beef, *Salmonella*, STEC, Antimicrobial resistance.

Giriş

Sığır eti ve kıyma ürünleri, zoonotik bakteri taşınımı açısından yüksek risk taşımaktadır. Bu patojenler arasında *Salmonella spp.* ve Shiga toksinjenik *Escherichia coli* (STEC), ciddi akut gastroenterit vakaları, hemolitik üremik sendrom (HÜS) ve gıda kaynaklı salgınlarla ilişkilendirilen en kritik etkenler arasında yer almaktadır.

Salmonella enfeksiyonları dünya çapında halk sağlığı ve gıda endüstrisi açısından büyük bir endişe kaynağıdır. *Salmonella* suşları ve virülan klonlardaki antibiyotik direnci, insanlarda enfeksiyon tedavisini tehlikeye atabilir ve küresel halk sağlığı için ciddi bir risk oluşturabilir. Bu nedenle Dünya Sağlık Örgütü *Salmonella* bakterisini "öncelikli patojen" olarak tanımlamıştır. Shiga toksini üreten *Escherichia coli* (STEC), sitotoksik kapasiteye sahip toksin ürettiği için önemli bir halk sağlığı endişesi patojenidir (Hussein, H. ve Sakuma, T. 2005).

Sığırlar, STEC (özellikle O157:H7) için ana rezervuar olup, hem *Salmonella* spp. hem de STEC insanlarda ciddi gastrointestinal hastalıklara, hemolitik üremik sendroma (HÜS) ve salgınlara neden olabilir. Kıyma üretim sürecindeki karıştırma ve geniş yüzey alanı, kontaminasyon riskini artırır. Bu derlemenin amacı, dünya ve Türkiye verilerini karşılaştırarak prevalans, serotip dağılımı ve antimikrobiyal direnç eğilimlerini detaylandırmaktır.

Bu amaçla 2000–2025 döneminde PubMed, Scopus, Web of Science, ScienceDirect, Google Scholar ve ulusal veri tabanları tarandı. Arama anahtar kelimeleri: "Salmonella, STEC, E. coli O157:H7, beef, ground beef, minced meat, prevalence, antimicrobial resistance, meat safety" idi. Dahil edilen çalışmalar kültür ve/veya moleküler doğrulama, serotiplendirme ve standart disk difüzyon veya MIC tabanlı duyarlılık testleri içermektedir. Çalışmalar coğrafi bölge, örnek tipi (kıyma, kasap eti, perakende), laboratuvar yöntemi, bulunduğu yıl ve bildirilen serotip/serogrup ve Antimikrobiyal Direnç (AMR) profiline göre sınıflandırıldı.

Gelişme

Beslenmenin temel ögelerinden birisi olan kırmızı et, insanlık tarihi boyunca tüketilmektedir (Çarbuğa, Ü. ve Memiş Kocaman, E., 2019). Et, temel yağ asitleri, mineraller ve vitamin kaynağıdır ancak çeşitli mikroorganizmaların büyümesi için uygun ortam sağladığı için kolayca bozulabilir (Bantawa ve ark., 2018). Kırmızı et üretiminin %80'den fazlasını sığır eti oluşturmaktadır (Niyaz, Ö. C. 2018). . Sığır eti, insanların en temel protein kaynaklarından biridir (Başer, U. 2021) . Etin çok ince şekilde makinada ya da elle çekilmiş haline kıyma denir. Kıymanın proses sürecinde birçok noktaya (alet ve ekipman, personel vb.) temas etmesi, oksijenin dokuya girmesi ve dokunun parçalanarak mikroorganizmalar için doğal besiyerine dönüşmesi bununla birlikte birçok ürünün (köfte, hamburger vb.) ana hammaddesi olarak kullanılması bakımından güvenli gıda kavramı içerisinde en riskli gıdalar arasında sayılmaktadır (Al-Dalali, S., Li, C., ve Xu, B. 2022). Kavrut, 2021). Kıyma ürünlerinde en yaygın bildirilen patojenik bakterilerden ikisi *Salmonella ve* Shiga toksijenik *E. Coli'dir* (Wang ve ark., 2022). Yaklaşık 1,4 milyon vaka tifo dışı *Salmonella* serotiplerinden ve 270.000 vaka ise patojenik STEC' den kaynaklanmaktadır (Bantawa ve ark., 2018).

Sığır eti ürünleri, dünya genelinde gıda kaynaklı enfeksiyonlar açısından kritik öneme sahiptir. Özellikle *Salmonella* ve Shiga toksin üreten *Escherichia coli* (STEC), hem tüketiciler hem de gıda endüstrisi için önemli riskler oluşturmaktadır. Son yıllarda yapılan araştırmalar, bu patojenlerin perakende sığır eti ve kıyma ürünlerinde yaygın olduğunu, bazı serotiplerin özellikle non-O157 STEC'nin giderek baskın hale geldiğini ve çoklu antibiyotik dirençlerinin arttığını göstermektedir.

Sığırların dışkısıyla kontamine olmuş gıdalar STEC enfeksiyonlarının ana kaynağıdır. 2021 yılında yayınlanan rapora göre Avrupa birliği ülkelerinde insanlarda görülen gıda kaynaklı hastalıklarda STEC enfeksiyonları dördüncü sırada yer almaktadır (EFSA, 2023). Benzer şekilde Amerika Birleşik Devletlerinde'de gıda kaynaklı hastalıklar listesinin dördüncü (STEC O157 olmayan) ve beşinci (STEC O157) sırasında bildirilmiştir (Wang ve ark., 2022). Antimikrobiyal ilaçların kullanımı (ve yanlış kullanımı) nedeniyle bakteriler bu ilaçlara karşı dirençli hale gelmiş ve direnç zamanla istikrarlı bir artış göstermiştir (Smith, J. L., ev ark, 2014).

Kosta Rika'nın dört büyük şehrini kapsayan alanlarda toplam 279 adet sığır eti örneği satın alınmıştır ve *Salmonella* ve STEC'e özgü moleküler açıdan test edilmiştir. *Salmonella* genel yaygınlığı %3,6, STEC genel yaygınlığı %4,7 dir (Chaves, B. D., Echeverry, A., ve ark.,2015). Nijerya, Zaria'da perakende sığır eti ve ilgili et ürünlerinden oluşan 182 örnek STEC açısından değerlendirilmiştir. STEC için %2,2'lik bir genel yaygınlık elde edilmiştir. İzolatların yaygın olarak kullanılan 18 antimikrobiyal maddeye duyarlılıkları disk difüzyon yöntemi ile belirlenmiştir. Tüm izolatlar test edilen antimikrobiyal maddelere karşı çoklu ilaç direnci göstermiştir. (Tafida S. Y ve ark.,2014). Arjantin, Buenos Aires'te farklı 36 pazardan toplanan kıyma örneklerinin STEC varlığını araştırılmıştır. 252 örnekten 91'inde(%36,1) STEC bulunmuştur. 57 STEC suşu elde edilmiştir. 11 STEC suşu O157 serogrubuna, 46' sı ise O157 olmayan serogruplarına aittir. STEC suşlarının 16'sı Ampisilin, Streptomisin, Amikasin veya Tetrasikline dirençlidir (Llorente, P., Barnech, L., ve ark.,2014). 2017 yılında İtalya'nın 13 bölgesinden toplanan sığır etlerinde STEC yaygınlığını belirlemek amacıyla 239 örnek analiz edilmiştir ve bunlardan dokuzu (%3,76) STEC pozitiftir (Varcasia, B. M., Tomassettive ark.,2017) Burkina Faso'daki yerel pazarlarda satılan çiğ et STEC yaygınlığı araştırılmıştır. Ekim 2008 ile Şubat 2009 arasında farklı pazardan 36 sığır eti satın alınmış, 16'sında (%44) STEC tespit edilmiştir (Kagambèga, A., Martikainen.,ve ark.,2012). Çin'deki iki sığır eti işletmesinde STEC varlığını ve antibiyotik direncinin yaygınlığını araştırmak amacıyla 6 merkezden toplanan toplam 600 örnek toplanmış %42,3 STEC bulunmuştur. Toplam 26 izolat arasından yedi suşun en az üç antibiyotiğe dirençli olduğu bulunurken, üç suşun 10'dan fazla antibiyotiğe dirençli olduğu belirlenmiştir, bu da çalışmadan izole edilen STEC örneklerinde yüksek antibiyotik direnci olduğunu göstermiştir (Dong, P.,ve ark. 2020).

E.coli O157:H7 hastalıkla ilişkili en sık görülen serotip olmaya devam etmektedir. Brezilya'da STEC prevalansının sığırlarda %90 ve et ürünlerinde %20 gibi yüksek değerlere ulaşmakta olduğu ve bu durumun Brezilya gıda ihracat ticaretini etkileyebileceği belirtilmiştir. O157:H7 STEC enfeksiyonlarının görülme sıklığı, O157 olmayan STEC enfeksiyonlarına kıyasla daha yüksektir. Ancak, gıda ve hayvan dışkısında O157 olmayan STEC'in görülme sıklığı, O157:H7 STEC'in görülme sıklığından daha fazladır (Gonzalez, G. A., ve Cerqueira, M. A. 2020).

Güney Etiyopya'da belediye mezbahasındaki çiğ sığır etinden toplam 448 örnek toplanmış, 56'sında (%12,5) *Salmonella* gözlenmiştir. Tetrasiklin, Nitrofuransiyon ve Streptomisin direnci sırasıyla %83, %73 ve %6 olarak tespit edilmiştir (Wabeto ve ark., 2017). İran'da yürütülen çalışmada, fast-food merkezleri ve restoranlardan toplanan çiğ kebap ve hamburger örneklerinde *Salmonella spp.* varlığı araştırılmıştır. *Salmonella spp.* %10 oranında tespit edilmiştir. *Salmonella* izolatlarında en yüksek antibiyotik direnci penisiline (%97,5) karşı belirlendi, bunu Sefaleksin (%96,77) ve Amoksisilin (%88,46) dirençleri izlendi. İzolatların %91,17'sinde dört veya daha fazla antibiyotiğe karşı çoklu ilaç direnci gözlemlenmiştir (Rajaei ve ark., 2021). Meksika'da perakende satış noktalarından toplanan 115 kıyma örneğinde *Salmonella* Enterica ve antimikrobiyal direnç profili araştırılmıştır. Örneklerin 48'inde (%41,7) *Salmonella* Enterica varlığı saptandı. En sık direnç tetrasiklin (%39,7), Kloramfenikol (%37,9)

ve Streptomisin (%37,1)'e karşı belirlenmiştir. İzolatların %38,8'inde çoklu ilaç direnci tespit edilmiştir. (Campos Granados ve ark., 2023).

Avrupa Birliği onaylı bir kesim ve parçalama tesisinde üretilen kıymalardaki *Salmonella* sıklığı ayrıntılı olarak araştırılmıitır. 21 ay boyunca, 297 havuz örneği (1.485 ayrı örnek) sığır kıyma incelenmiştir.Örneklerinin 47'sinde (%15,8) *Salmonella* tespit edildi. Pozitif havuzların ayrılmasından sonra, 93 ayrı örneğin *Salmonella* pozitif olduğu belirlendi. Serotiplendirme sonucunda izolatların çoğu (%69,6) *Salmonella* Typhimurium olarak tanımlanlanmıştır (Stock K ve ark.,2001). Senegal'in Dakar şehrinde 435 sığır eti (mezbahadan 236, perakendecilerden 199) *Salmonella* yönünden araştırılmıştır. Bunlardan 101'i (%43) mezbahadan, 174'i (%87) perakendecilerden olmak üzere 275'i (%63) *Salmonella* için pozitif bulunmuştur. İzolatların %62'si nitrofuranlara, %22'si streptomisine, %15'si sülfametoksazol'e, dirençli tespit edilmiştir. *Salmonella* örneklerinin yaklaşık %16'sı iki veya daha fazla antibiyotik ailesine karşı çoklu antibiyotik dirençli tespit edilmiştir (Stevens ve ark.,2006).Meksika'nın Jalisco Eyaletinde üç farklı belediyedeki kasaplardan 11 aylık süre içinde toplanan 238 kıyma örneğinin 135'inde (%56,7) *Salmonella* izole edilmiştir. İzolasyon sıklığı belediyeye göre farklılık göstermiştir. *Salmonella* izolasyonu sıcak mevsimde (%68,5) soğuk mevsime (%43,2) göre daha yüksek bulunmuştur. Suşların Tetrasikline (%40,7), Streptomisine (%35,6), Trimetoprim-sülfametoksazole (%20,7) ve Nalidiksik asite (%19,3) dirençli olduğu, 37 *Salmonella* izolatının ise (%27,4) çoklu ilaca dirençli olduğu tespit edilmiştir (Cabrera-Diaz ve ark., 2013).

Güneybatı Etiyopya'nın Jimma Bölgesindeki Mezbahalardan (n=210) ve kasap dükkanlarından (n=138) 348 sürüntü örneği toplandı. *Salmonella* pozitiflik oranı mezbaha örneklerinde %11,4 iken, kasaplarda %6,52 olarak tespit edilmiştir. 33 *Salmonella* izolatından mezbaha ve kasap dükkanlarından izole edilenlerin 14'ü (%58,3) ve 6'sı (%66) sırasıyla iki veya daha fazla antibiyotiğe dirençli bulunmuştur (Geresu ve ark., 2021). Pakistan' ın Karaçi şehrinde yapılan bir araştırmada kasap dükkanlarında ve süpermarketlerde satılan toplam 150 çiğ sığır eti örneği toplanmıştır (kaslardan, lenf düğümlerinden ve kıymadan her birinden 50 örnek). *Salmonella*'nın genel yaygınlığının %21,34 olduğu bulunmuştur. Süpermarketlerden toplanan sığır eti örneklerinde *Salmonella* tespit edilmemiştir. Antibiyotik duyarlılık testleri, *Salmonella* izolatlarının Oksitetrasiklin (%90), Ampisilin (%90,5), Amoksisilin (%81,1), Tetrasiklin (%76), Neomisin (%79,8) ve Siprofloksasin'e (%61,4) karşı ileri derecede dirençli olduğunu ortaya koymuştur (Altaf Hussain ve ark.,2020).

Bu uluslararası bulgular, sığır eti ürünlerinde *Salmonella* ve STEC'nin hem prevalans hem de antibiyotik dirençleri açısından bölgesel farklılıklar gösterdiğini ortaya koymaktadır. Non-O157 STEC serotipleri özellikle Avrupa ve Asya'da giderek daha baskın hale gelmektedir ve bu durum gıda güvenliği açısından ciddi riskler taşımaktadır.

Türkiye'de yapılan araştırmalar, uluslararası bulgularla paralellik göstermekte, ancak prevalans oranları genellikle daha düşük ya da orta seviyede raporlanmaktadır. İstanbul'da 150 perakende kıyma ve köfte örneğinde *Salmonella* prevalansını %1–24 (2–36/150), STEC O157 oranını %1–3 (2–5/150), non-O157 O26 ve O103 %1–2 (2–3/150) olarak bulmuştur. Baskın *Salmonella* serotipleri *S*. Typhimurium ve *S*. Enteritidis olup Tetrasiklin ve Ampisilin dirençleri %40–50 civarındadır (Yıldırım, S. 2016). Aydın ili ve çevresinde satışa sunulan hazır kıyma ve hamburger köftelerinde, halk sağlığı açısından ciddi risk oluşturan *E. coli* O157:H7 varlığını araştırmak amacıyla farklı market, kasap vb. satış noktalarından elde edilen 50 adet kıyma ve 30 adet hamburger köftesi incelenmiştir. İncelenen örneklerin 12'si *E. coli* O157, 10'u *E. coli* O157:H7 pozitif olduğu gözlenmiştir. İncelenen örneklerden *E. coli* O157:H7 pozitif olanların 4'ü kıymadan ve 6'sı hamburger köftelerinden izole edilmiştir. (Kök ve Sezgin, 2015).

Ankara' da hizmet veren fast-food işletmelerinden seçilen, toplam 8 fast-food işletmesinden elde edilen 160 hamburger örneğinde yapılan çalışmamızda 17 hamburger örneğinde (% 10.6) *E.coli* 0157.H 7 serotipinin varlığı belirlenmiştir (Baş, M., ve Merdol, T. K. 2002). Samsun'da çeşitli kasap ve süpermarketlerden temin edilen 100 hazır kıyma ve 100 çiğ köfte numunesinde immunomagnetik seperasyon ve PCR metoduyla *E. coli* O157 ve O157:H7 varlığı araştırılmış ve yapılan analizler sonucunda 1 hazır kıyma ve 4 çiğ köfte numunesinde *E. coli* O157 suşuna rastlanıldığı ve örneklerin H7 yönünden negatif olduğu bildirilmiştir (Çadırcı, Ö.ve ark.,2010). Kayseride yaptıkları bir araştırmada, beş farklı satış noktasından, eylül ve kasım ayları arasında, ikişer haftalık periyodlarla aldıkları 100 adet çiğ köfte numunesi üzerine yapmış oldukları bir araştırmada sonucunda 70 adet fekal *E. coli* tespit edildiğini fakat *E. coli* O157:H7 varlığını tespit edemediklerini bildirmiştir (Ertaş, N. ve Gönülalan, Z. 2010).

Erzurum ve çevresindeki mezbaha ve kasap dükkanlarından alınan 140 kıyma örneğinin 4 tanesinde *Salmonella* spp. tespit edilmiştir.çalışmada S. Typhimurium serotiplere değinilmiş ve rep-/ERIC-PCR ile genotiplendirme yapılmıştır (Adıgüzel, 2012). Amasya bölgesinde tüketime sunulan sığır orjinli kıyma ve çiğ hazır köfte örneklerinde *Salmonella* varlıklarının belirlenmesi amacıyla 50 sığır eti kıyması ve 50 çiğ hazır köfteden oluşan100 örnek analiz edildi. Analiz bulguları çerçevesinde; *Salmonella spp*. pozitif örnek sayısı 6 (%6) olup, 4'ü (%8) kıyma örneğinden, 2'si (%4) ise sığır orjinli çiğ hazır köfte örneğinden izole edilmiştir (Yıldırım ve ark. 2016). Ağrı ilinde yapılan çalışmada, toplam 60 adet kıyma örneği, Ağrı ili merkezindeki kasaplar ve marketlerden satın alınarak *Salmonella* varlığı bakımından incelenmiştir. Toplam 60 kıyma örneğinin 15'i (%25) *Salmonella* bakımından pozitif bulunmuştur.izole edilen tür *Salmonella* Enterica olarak raporlanmıştır (Deniz, G. Y., ve Ulukanlı, Z. 2012).

Samsun ilinde toplanan 50 adet çiğ kıyma ve 50 adet çiğ köfte örneğinde *Salmonella*'nın tespiti için konvansiyonel kültür tekniği ve PCR testi kullanılmıştır. *Salmonella*, 20 örnekte (Toplam 86 izolat) , yani 12 adet kıyma (%24) ve 8 adet köfte(%16) örneğinde tespit edilmiştir. İzolatların dokuzu antibiyotiğe karşı antibiyotik direnç profilleri test edilmiştir (Siriken ve ark.,2020). Amasya ilinde gerçekleştirilen bir çalışmada, 50 sığır eti kıyması ve 50 çiğ hazır köfte örneği *Salmonella spp.*'nin varlığı araştırılmıştır. Analiz sonucunda altı (%6) örnekte *Salmonella spp.* varlığı tespit edilmiştir. Bu pozitif örneklerin dördünün (%8) kıyma, ikisinin (%4) ise köfte örneklerinden elde edildiği bildirilmiştir. Elde edilen bulgulara göre kıyma ve köftelerin, halk sağlığı açısından potansiyel bir *Salmonella spp.* kaynağı olabileceği sonucuna varılmıştır (Yıldırım ve ark., 2016).

Samsun'da yapılan çalışmada, 50 çiğ kıyma ve 50 çiğ köfte örneğinde *Salmonella spp.* varlığı, antibiyotik direnç profili incelenmiştir.Örneklerin 20'sinde *Salmonella spp.*'nin varlığı saptanmıştır. Pozitif örneklerin 12'sinin kıyma, 8'inin ise köfte örneklerinden elde edildiği bildirilmiştir. İzolatların çoğunun *S.* Enteritidis ve *S.* Tphimurium *y*serovarlarına ait olduğu belirlenmiştir;antimikrobiyal direnç testleri yapılmış, izolatların önemli bir kısmında çoklu ilaç direnci (MDR) gözlenmiş; Tetrasiklin, Streptomisin, Ampisilin, Nalidiksik asit gibi ilaçlara direnç bildirildiği; ayrıca sınıf-1 integron varlığı tespit edilmiştir dört örnekte sınıf 1 integronun varlığının tespit edilmiştir (Sırıken ve ark., 2020). Ankara ve Konya'da tüketime sunulan. 40 adet kıyma 40 adet köfte toplamada 80 adet numune alınarak *Salmonella spp*. kontaminasyonu yönünden incelenmiştir. Çiğ kıyma örneklerinin %10'unda, hazır köfte örneklerinin %7,5'inde *Salmonella spp*. varlığı saptanmıştır (Bilgir, H. E. 2022).

Ulusal bulgular, Türkiye'de hem *Salmonella* hem de STEC'nin düşük-orta seviyede prevalans gösterdiğini, non-O157 STEC serotiplerinin giderek arttığını ve bazı antibiyotiklere karşı direnç oranlarının yüksek olabildiğini ortaya koymaktadır.

Sonuç

Sığır eti ve kıyma ürünleri, hem *Salmonella spp.* hem de STEC açısından önemli bir kontaminasyon kaynağı olup, bu patojenler küresel ölçekte ciddi bir halk sağlığı tehdidi oluşturmaktadır. Prevalansın yüksekliği ve MDR suşların yaygınlığı, üretim zinciri boyunca hijyen uygulamalarının geliştirilmesi, etkili sürveyans programlarının güçlendirilmesi ve antimikrobiyal dirençle mücadele stratejilerinin önceliklendirilmesi gerekliliğini ortaya koymaktadır.

Alınabilecek önlemler şöyle sıralanabilir: Gıda zincirinde kontrol önlemleri olarak kesimhane hijyeni, soğuk zincir yönetimi, işlem sonrası kontaminasyonu önleyecek ekipman temizliği ve personel hijyeni uygulamaları, gereksiz veteriner antibiyotik kullanımının azaltılması, kıyma ürünlerinin iç sıcaklığının 71–75 °C'ye çıkarak pişirilmesi, çapraz kontaminasyondan kaçınılması.

ÖZET

Bu derlemenin amacı, halkın tüketimine sunulan peynirlerde Shiga toksini üreten *Escherichia coli* (STEC) varlığına ilişkin güncel literatürü incelemek, farklı ülke ve ürün tiplerinde bildirilen prevalans oranlarını karşılaştırmak ve STEC'in halk sağlığı üzerindeki etkilerini değerlendirmektir. Bu çalışma, 2006–2025 yılları arasında yayımlanan ulusal ve uluslararası araştırmaların taranmasına dayanmaktadır. PubMed, Scopus, Web of Science, ScienceDirect, Google Scholar ve TR Dizin veri tabanları "STEC", "*Escherichia coli* O157:H7", "Shiga toxin", "cheese contamination", "raw milk cheese", "dairy products" anahtar kelimeleri kullanılarak taranmıştır. STEC tespiti için kültür, PCR ve virülans genlerinin (stx1, stx2, eae) analizi yapılan çalışmalar derlemeye dahil edilmiştir. STEC, dünya çapında ciddi gıda kaynaklı patojenler arasında yer almakta olup hemorajik kolit ve HÜS gibi ağır klinik tablolarla ilişkilidir. Literatürde peynirlerde STEC prevalansı ülkeler arasında geniş varyasyon göstermektedir. İtalya'da %7,3, İngiltere'de %0,6 gibi nispeten düşük oranlar bildirilirken; Mısır'da ürün tipine göre %2,5–36 arasında değişen oldukça yüksek düzeyler rapor edilmiştir. İsviçre'de yapılan iki yıllık araştırmada prevalansın %3,7–6,3 arasında değiştiği, Romanya'da çiğ süt peynirlerinde stx1 ve stx2 pozitiflik oranlarının %2,3–9,3 olduğu bildirilmiştir. Bu çalışmalar hem O157:H7 hem de O157 dışı STEC serotiplerinin peynir kaynaklı enfeksiyonlarda önemli rol oynadığını göstermektedir. Özellikle çiğ süt temelli ya da yeterince olgunlaştırılmamış peynirlerde kontaminasyon riskinin daha yüksek olduğu vurgulanmaktadır. Peynirlerde STEC varlığının düşük prevalanslı bölgelerden yüksek riskli bölgelere kadar geniş bir aralıkta bildirildiği görülmektedir. STEC kaynaklı riskin azaltılması için güçlü bir gıda güvenliği yaklaşımına ihtiyaç olduğu ortaya koyulmaktadır.

Anahtar kelimeler: Peynir, *E.coli*, O157, STEC, antibiyotik direnci.

INVESTIGATION OF THE RISK OF SHIGA TOXIN-PRODUCING *Escherichia coli* (STEC) IN MARKETED CHEESES

ABSTRACT

The aim of this review is to examine the current literature on the presence of Shiga toxin-producing *Escherichia coli* (STEC) in cheeses marketed for public consumption, compare the prevalence rates reported across different countries and product types, and assess the public health impacts of STEC. This study is based on a search of national and international studies published between 2006 and 2025. PubMed, Scopus, Web of Science, ScienceDirect, Google Scholar, and TR Index databases were searched using the keywords "STEC," "*Escherichia coli* O157:H7," "Shiga toxin," "cheese contamination," "raw milk cheese," and "dairy products." Studies that used culture, PCR, and analysis of virulence genes (stx1, stx2, eae) for STEC detection were included in the review. STEC is among the most serious foodborne pathogens worldwide and is associated with severe clinical conditions such as hemorrhagic colitis and HUS. The prevalence of STEC in cheeses in the literature shows wide variation across countries. While relatively low rates of 7.3% and 0.6% have been reported in Italy and the UK, significantly higher levels ranging from 2.5% to 36% have been reported in Egypt, depending on the product type. A two-year study in Switzerland reported prevalence ranging from 3.7% to 6.3%, and in Romania, stx1 and stx2 positivity rates in raw milk cheeses were reported as 2.3% to 9.3%. These studies indicate that both O157:H7 and non-O157 STEC serotypes play an important role in cheese-borne infections. The risk of contamination is particularly high in raw milk-based or inadequately ripened cheeses. The presence of STEC in cheese has been reported across a wide range of areas, from low-prevalence to high-risk areas. This demonstrates the need for a robust food safety approach to reduce the risk from STEC.

Keywords: Cheese, *E. coli,* O157, STEC, antibiotic resistance.

Giriş

Gıda kaynaklı hastalıklar dünya çapında önemli bir halk sağlığı sorunudur (Kirk ve ark, 2014). Gelişmiş ve gelişmekte olan ülkelerde gıda kaynaklı hastalıkların artan oranları, gıda güvenliğinin eksikliğiyle bağlantılı olarak sürekli bir halk sağlığı sorunu haline gelmiştir (Avınca ve ark, 2023). Dünya Sağlık Örgütü, her yıl dünyadaki her 10 kişiden birinin kontamine gıdaları tüketerek gıda kaynaklı enfeksiyona yakalandığını bildirmiştir (Şireli ve ark, 2023). Gıda kaynaklı hastalıklar ortaya çıkan mikroorganizmalar ve toksinler, antibiyotik direncinin büyümesi, yeni ortamlar ve gıda üretim yöntemlerinin neden olduğu artan gıda kontaminasyonu ve çok eyaletli salgınlardaki artış nedeniyle daha büyük bir zorluk haline gelmektedir (Switaj ve ark, 2015). Günümüzde 250'den fazla gıda kaynaklı hastalık ve bu hastalıklara neden olan değişik tipte birçok mikroorganizma mevcuttur (Muratoğlu ve ark, 2015).

Peynir, dünyanın dört bir yanında çok çeşitli tat ve formlarda bulunan, fermente süt bazlı bir gıda türüdür (Khattab ve ark, 2019). Peynir, sütün uygun proteolitik enzimlerle veya organik asitlerle pıhtılaştırılması, pıhtının çeşitli şekillerde işlenmesi, pıhtıdan peynir altı suyunun ayrılması, baskılanması, şekillendirilmesi ve tuzlanmasıyla elde edilen taze veya olgunlaştırılarak tüketilen bir süt ürünüdür (Atasever ve ark, 2019). Peynir, A vitamini, riboflavin ve B12 vitamini açısından iyi bir kaynaktır ve yüksek yağ içeriği nedeniyle peynir, D vitamini ile güçlendirilmeye uygundur. (Fox ve ark, 2017). Peynir, renk, aroma, doku, lezzet ve sertlik dahil olmak üzere özelliklerinde büyük ölçüde değişiklik gösterebilir ve bunlar genellikle üretim teknolojisine, sütün kaynağına, nem içeriğine ve olgunlaşma süresine ek olarak belirli küf, maya ve bakterilerin varlığına atfedilebilir (Santiago-Lopez ve ark, 2018).

Peynirin kalitesi ve ticari değeri öncelikle fiziko-kimyasal özellikleri, belirli duyusal nitelikleri, kullanım özellikleri ve besin özellikleri tarafından belirlenir. Bu işlevlerin çoğu peynir yapısı tarafından belirlenir ve özel işlevler tasarlamak için yapı ve işlevsellik arasındaki ilişkilerin uygun şekilde anlaşılmasını gerektirir (Lamichhane ve ark, 2018). Peynir, üretim, olgunlaşma ve pazarlama sırasında mikrobiyolojik ve biyokimyasal değişimleri nedeniyle bozulabilir bir üründür (Jafarzadeh ve ark, 2021). Kontaminasyon, yetersiz süt pastörizasyonu veya ısıl işlemden sonra kontaminasyon (yani, işleme sırasında ve olgunlaşma ortamlarıyla temas sırasında çapraz kontaminasyonlar) ile ilişkilendirilebilir (Morandi ve ark, 2019). Dünyada farklı tat ve lezzete sahip birçok peynir çeşidi mevcuttur (Karabıyıklı ve ark, 2019). Yumuşaktan serte, beyazdan sarıya ve taze olandan olgunlaştıktan sonra eskitilmiş olana kadar birçok peynir çeşidi vardır (Bouroutzika ve ark, 2021). Peynirlerdeki farklılıklar büyük ölçüde peynirin üretim yöntemi, çeşitlerin çeşitliliği ve niteliğindedir (Atasever ve ark, 2019).

Escherichia coli insanlar da dahil olmak üzere bütün sıcak kanlı hayvanlarda normal bağırsak florası olarak bulunan Gram negatif, fakültatif anaerob basillerdir. *E. coli* 'nin bazı türleri stx1 ve/veya stx2 geni tarafından kodlanan Shiga toksini üretir. "Shiga toksin üreten E. *coli*" veya kısaca STEC adı verilmektedir. STEC enfeksiyonlarının semptomları kişiden kişiye değişir. Bazı enfeksiyonlar çok hafiftir ancak bazıları şiddetlidir ve yaşamı tehtid eder. Çoğunlukla şiddetli, mide krampları, kanlı ishal ve kusma görülür. *E. coli* serotipi O157:H7 ve O157 olmayan serogruplar da dahil olmak üzere, Shiga toksini üreten *Escherichia coli* (STEC), dünya çapında gıda kaynaklı başlıca patojenlerdir. Dünya çapında birçok salgın O157:H7'ye atfedilmiş olsa da yaklaşık 400 STEC serotipinin hastalıkla ilişkili olduğu düşünülmektedir (Karmali ve ark, 2010). Dünya Sağlık Örgütü'ne (WHO) göre, artan sayıda STEC salgını, çiftlik hayvanlarının veya gübrenin akıntılarıyla ve yakınlardaki çiftliklerde yaşayan yaban hayvanlarının dışkısıyla kirlenmiş sebze ve meyvelerin tüketimiyle ilişkili olabilir (Dias ve ark, 2022). STEC, hemorajik kolit ve hemolitik üremi sendromu dahil olmak üzere ciddi

hastalıklara neden olabilir (Castro ve ark, 2019). Hemolitik Üremik Sendrom (HÜS) prevalansı hem Türkiye'de hem de dünyada giderek artan bir eğilim göstermektedir. HÜS, Shiga toksini (Stx) üreten Escherichia coli (STEC) O157 ve O157 olmayan STEC suşları tarafından oluşturulabilir. Shiga toksini üreten Escherichia coli (STEC), gıda kaynaklı enfeksiyonların önemli bir nedeni olarak ortaya çıkan ve sonuç olarak dünya çapında önemli bir halk sağlığı sorunu haline gelen zoonotik patojenlerdir (Authority, 2017). Dünya çapında, STEC ile oluşan insan enfeksiyonlarının yılda 2,8 milyon hastalığa, yaklaşık 4.000 hemolitik üremi sendromu (HÜS) vakasına, 270 kalıcı böbrek hastalığına ve 230 ölüme neden olduğu tahmin edilmektedir (Conrad ve ark, 2016). STEC enfeksiyonları, dünya çapında çocuklarda ve yaşlılarda şiddetli ishal hastalığı salgınlarına neden olmaktadır (Mühlen ve ark, 2020). Çocuklarda hemolitik üremik sendromun (HUS) önde gelen nedeni, büyük bir salgın potansiyeline sahip olan STEC enfeksiyonudur (Bruyand ve ark, 2018). STEC'in ana virülans genleri, Shiga toksinlerini kodlayan stx genleri ve yapışma ve yapışmayı yok etme mekanizmasında rol oynayan 90 kDa intimin proteinini kodlayan eae'dir. Shiga toksini genleri stx 1 ve stx 2 olarak ayrılır ve başka alt tipleme şemaları da mevcuttur (Scheutz ve ark, 2012). STEC, son yıllarda, çiğ ve pastörize süt peyniri tüketimiyle ilişkili STEC enfeksiyonlarının sayısı artmış olup, halkın farkındalığının artırılmasına katkıda bulunmuştur (Cortimiglia ve ark, 2021). STEC, sağım işlemi sırasında dışkı yoluyla sütü kirletebilir ve pastörizasyon işlemi uygulanmamışsa peynir yapımı sırasında hayatta kalabilir veya üreyebilmektedir (Condoleo ve ark, 2022).

İtalya'da 2024 yılında 82 peynir örneğinde Shiga toksini üreten *Escherichia coli'nin* (STEC) varlığı araştırılmıştır. Bu örneklerde STEC varlığı %7,3 (82 peynirden altısı) olarak tespit edilmiştir (Morandi ve ark, 2024). Mısır'da 2023 yılında Shiga toksini üreten *Escherichia coli'* nin (STEC) varlığı araştırılmıştır. 150 yumuşak peynir (50 Karish, 50 Tallaga, 40 işlenmiş ve 10 beyaz peynir) örneği toplanmıştır. Sonuçlar, Kariesh örneğinde STEC varlığı %36, Tallaga örneğinde STEC varlığı %24, İşlenmiş peynir örneğinde STEC varlığı %2,5 olarak tespit edilmiştir. İncelenen beyaz peynir örneklerinde STEC varlığı tespit edilememiştir (Sobeih ve ark, 2024). İngiltere'de 2019-2020 yılları arasında 629 peynir örneğinde Shiga toksini üreten *Escherichia coli'*nin (STEC) varlığı araştırılmıştır. Çoğunluğu (%80) inek sütü kullanılarak yapılırken, %14'ü koyun sütünden ve %5'i keçi sütünden yapılmıştır. Bu örneklerde STEC varlığı %0,6 olarak tespit edilmiştir (Willis ve ark, 2022).

İsviçre'de 2006-2007 yılları arasında 796 peynir örneğinde Shiga toksini üreten *Escherichia coli'*nin (STEC) varlığı araştırılmıştır. 2006 yılında toplanan 432 peynir örneğinde %3,7 (16'sı) ve 2007 yılında toplanan 364 peynir örneğinde %6,3 (23'ü) STEC varlığı (stx geni) tespit edilmiştir (Stephan ve ark, 2008). Romanya'da 2020-2021 yılları arasında Shiga toksini üreten *Escherichia coli'*nin (STEC) varlığı araştırılmıştır. Toplam 53 çiğ süt peynir (37'si çiğ süt ineği ve 16'sı koyun yarı yumuşak tuzsuz geleneksel peynir) örneği toplanmıştır. Bu örneklerde STEC izolatlarının %9,3'ünün (4/43) stx 2 ve %2,3'ünün (1/43) stx 1 virülans genlerini barındırdığı tespit edilmiştir (Imre ve ark, 2022).

Meksika'da 2011 yılında 52 taze pastörize edilmemiş peynir örneğinde *Escherichia coli* varlığı araştırılmıştır. Bu örneklerin %63'ü *E. coli* açısından pozitif çıkmıştır. Tüm *E. coli* izolatları (121 suş) 26 virülans geninin varlığı açısından analiz edildikten sonra, 8'inin O157 olmayan Shiga toksini üreten *E. coli* (STEC) taşıdığı gösterilmiştir. Tüm STEC suşları stx 1 genini taşımaktadır (Guzman-Hernandez ve ark, 2016). Mısır'da 2018 yılında 150 Mısır peynirinde (Kariesh ve Ras) *Escherichia coli* ve ile virülans özellikleri araştırılmıştır. Kariesh peynirinde izole edilen *E. coli* %16 ve Ras peynirinde izole edilen *E. coli* %5,3'tür. İzolatların çoğunluğu *stx1 (%87,5)* ve *stx2* (%86) genine sahip olduğu tespit edilmiştir (Hussien ve ark, 2019).

Bu konuda yapılan ulusal çalışmalarda; Van'da 2014 yılında 100 oltu peynir örneğinde *Escherichia coli* O157:H7 varlığı araştırılmıştır. Otlu peynir örneklerinin %2'sinde *E. coli* O157:H7 tespit edilmiştir (Sancak ve ark, 2015). Hatay'da 2015-2016 yılları arasında 71 adet Hatay geleneksel peynirinde *E. coli* O157:H7varlığı ile virülans özellikleri araştırılmıştır. Bu örneklerin 16'sının (%12,2) *E. coli* O157:H7 ile kontamine olduğu tespit edilmiştir. İzolatların çoğunluğunun (%83,3) eaeA genine sahip olduğu ve intimin en yaygın virülans faktörü olarak belirlenmiştir (Can ve ark, 2017). Balıkesir'de 2018-2019 yılları arasında 35 Beyaz peynir örneğinde Shiga toksini üreten *Escherichia coli*'nin (STEC) varlığı araştırılmıştır. Bu örneklerde STEC varlığı %11,1 (29'unda) tespit edilmiştir (Gökmen ve ark, 2024). İstanbul'da 2018 yılında 100 adet taze kaşar peynir örneği *Escherichia coli* O157:H7 varlığı araştırılmıştır. Bu örneklerin 4'ünde (%2) *E. coli* O157:H7 varlığı tespit edilmiştir (Ekici ve ark, 2019). Kayseri'de 2023 yılında 50 peynir örneğinde *Escherichia coli* ile virülans özellikleri araştırılmıştır. Bu örneklerin %8'inde *E. coli* izole edilmiştir. Bu İzolatların çoğunluğunun STEC O157 (%3,6) olduğu tespit edilmiştir (Heybet ve ark, 2024). Bolu'da 2012 yılında 245 Türk ev yapımı beyaz peynirinde *Escherichia coli* O157:H7 varlığı araştırılmıştır. Bu örneklerde *E. coli* O157 tespit edilmemiştir (Arslan ve ark, 2013).

Sonuç: Peynirlerde STEC varlığının düşük prevalanslı bölgelerden yüksek riskli bölgelere kadar geniş bir aralıkta bildirildiği görülmektedir. STEC'in yüksek patojenitesi, düşük enfektif dozu ve HÜS ile ilişkisi, bu patojenin süt ve süt ürünlerinde halk sağlığı açısından kritik bir tehdit olduğunu göstermektedir. Çiğ süt kullanımının yaygın olduğu ülkelerde risk daha belirgin olup, üretim hijyeninin artırılması, ısıl işlem kontrollerinin iyileştirilmesi, geleneksel peynirlerde sıkı bir izleme programı uygulanması ve tüketicilerin bilinçlendirilmesi gerekmektedir. Bu değerlendirmeler, STEC kaynaklı riskin azaltılması için güçlü bir gıda güvenliği yaklaşımına ihtiyaç olduğunu ortaya koymaktadır.

ÖZET

Tatlısu ekosistemleri, biyolojik çeşitliliğin korunması ve insan kullanımına yönelik su kaynaklarının sürdürülebilirliği açısından kritik öneme sahiptir. Ancak sanayi faaliyetleri, madencilik, tarımsal akış, evsel atıklar ve atmosferik çökelme gibi nedenlerle ağır metal kirliliği giderek artmakta ve ekosistem sağlığını ciddi şekilde tehdit etmektedir. Bu derleme çalışması, özellikle son yıllarda Türkiye ve diğer ülkelerde tatlısu sistemlerinde yürütülmüş ağır metal araştırmalarını kapsamlı bir şekilde değerlendirerek ekotoksikolojik etkileri bütüncül bir çerçevede ele almaktadır. Literatür bulguları, ağır metallerin planktonlarda hücresel stres, makrofitlerde fotosentetik bozulma ve metal birikimi, balıklarda ise doku hasarı, oksidatif stres, üreme ve büyüme bozuklukları gibi çok yönlü toksik etkiler oluşturduğunu göstermektedir. Ayrıca, bu metallerin trofik zincir boyunca biyoakümülasyon ve biyomagnifikasyon yoluyla insan sağlığına kadar ulaşan riskler yarattığı belirlenmiştir. Kurşun (Pb), kadmiyum (Cd), civa (Hg), arsenik (As) ve krom (Cr) gibi ağır metaller, biyolojik olarak parçalanamaz yapıları nedeniyle suda ve sedimentte birikmekte, besin zinciri boyunca biyobirikim ve biyobüyütme süreçleriyle canlılarda toksik etkilere yol açmaktadır. Ağır metallerin ekotoksikolojik etkileri, sucul organizmalarda davranışsal değişikliklerden büyüme geriliklerine, üreme bozukluklarına ve yüksek mortalite oranlarına kadar geniş bir yelpazede görülebilmektedir. Tatlısu ekosistemlerindeki ağır metal kirliliğinin izlenmesi, ekotoksikolojik testler ve biyolojik indikatör türler üzerinden yapılan değerlendirmelerle mümkündür. Etkin yönetim stratejileri; kirletici kaynakların kontrolü, arıtma teknolojilerinin geliştirilmesi ve ekosistem temelli koruma yaklaşımlarının benimsenmesini gerektirir. Bu bağlamda ağır metal kirliliğinin azaltılması, hem sucul yaşamın sürdürülebilirliği hem de insan sağlığı açısından kritik önem taşımaktadır.

Anahtar Kelimeler: Ağır metaller; tatlısu ekosistemleri; su kirliliği; ekotoksikoloji; çevre kirliliği.

Giriş

Tatlısular, içme suyu temini, biyolojik çeşitliliğin sürdürülmesi ve ekolojik dengenin korunması açısından kritik bir öneme sahip ekosistemlerdir. Ancak, özellikle son yıllarda artan endüstriyel ve tarımsal faaliyetler, madencilik ile kontrolsüz evsel atık deşarjlarından kaynaklanan ağır metal kirliliği tatlısu kaynaklarında yoğun bir kirlilik baskısı oluşturmaktadır. Kurşun (Pb), kadmiyum (Cd), arsenik (As), civa (Hg) ve krom (Cr) gibi ağır metallerin biyolojik olarak parçalanamayan ve ortamda kalıcı özellikleri, su ve sediment birikimini artırarak ekosistem sağlığı üzerinde ciddi sorun yaratmaktadır (Singh ve ark., 2023). Bu metaller ekosisteme girdiğinde, hem canlılarda birikerek toksik etkilere neden olmakta hem de trofik zincir boyunca taşınarak insan sağlığına etki edecek boyutlara kadar ulaşabilmektedir.

Tatlı su ekosistemlerinde ağır metallerin davranışı, suyun fizikokimyasal özellikleri (pH, sıcaklık, redoks potansiyeli, çözünmüş oksijen vb.) ile sediment yapısına bağlı olarak değişiklik göstermektedir. Metaller genellikle su kolonundan sedimentlere hızla bağlanarak çökelirler. Bu nedenle sediment, tatlı su sistemlerinde metal birikiminin ana deposu hâline gelir. Ancak pH, sıcaklık ve çözünmüş oksijen gibi değişkenler metallerin tekrar suya geçmesine neden olabilir. Bu da metallerin biyoyararlanabilirliğini (bir ağır metalin solunması, yutulması veya deriden hangi oranda emildiğini ve kullanılabilir hale geldiğini) ve toksisiteyi artırır (Förstner & Wittmann, 2012). Bunun yanı sıra, pH düşüşü, redoks potansiyelinin değişmesi veya fiziksel sediment karışımı gibi çevresel faktörler metallerin yeniden çözünmesine ve biyoyararlanabilirliğinin artmasına da neden olabilir (Luoma & Rainbow, 2008). Metal iyonlarının çözünürlüğü ve toksisitesi, organik madde miktarı, kompleksleşme kapasitesi ve su sertliği gibi parametrelerle doğrudan ilişkilidir; örneğin Ca^{2+} ve Mg^{2+} iyonlarının yüksek olduğu sularda metallere bağlı toksisite belirgin şekilde azalır (Campbell, 1995). Bu süreçler sonucunda sudaki metaller plankton, makrofit ve balıklar tarafından biyolojik olarak alınabilir ve trofik düzeylerde biyoakümülasyon (*bir canlının kendi içinde ağır metali zamanla biriktirmesi)* ile biyomagnifikasyona (besin zinciri boyunca yukarı gidildikçe ağır metallerin artması) yol açabilir (Chapman ve ark., 1998). Bu nedenle metallerin tatlı su ekosistemlerindeki davranışı hem ekotoksikolojik etkilerin anlaşılması hem de risk değerlendirmesi açısından oldukça önemlidir.

Sucul sistemlerde ağır metaller plankton, makrofitler, böcekler, balıklar ve nihai olarak insan sağlığı üzerinde zincirleme çeşitli ekotoksikolojik etkiler oluştururlar. Planktonlar ağır metal kirliliğine karşı son derece duyarlı olup; yapılarındaki hücresel metabolizmanın bozulmasına fotosentetik pigmentlerde azalmaya, büyüme inhibisyonuna ve oksidatif strese neden olurlar (Wang & Dei, 2006). Makrofitlerde ise özellikle kök ve yaprak dokularında metal birikimine neden olurlar. Bu birikim klorofil sentezini baskılar, solunum ve fotosentez hızını azaltarak bitki fizyolojisini olumsuz bir şekilde etkiler (Mishra ve ark., 2008). Sucul ekosistemlerde böcekler, çevresel değişikliklere karşı yüksek hassasiyetleri, çeşitli ekolojik rolleri ve yaygın dağılımları nedeniyle özellikle değerli biyoindikatörlerdir (Parmar ve ark., 2016). Küçük boyutları, kısa yaşam döngüleri ve örnekleme kolaylığı, uygun maliyetli izlemeyi kolaylaştırırken, ağır metal konsantrasyonları gibi belirli abiyotik faktörlere karşı düşük toleransları, çevresel bozulmaların hassas bir şekilde tespit edilmesini sağlar (McGeoch, 1998 ; Priya ve ark., 2024). Chironomid larvaları, dokularında metal biriktirir ve bu da yaşam alanlarındaki kirlilik seviyelerini yansıtır (Nummelin ve ark., 2007; Talarico ve ark., 2014). Chironomidlerin ekotoksikolojik çalışmalarda model organizma olarak etkili bir şekilde kullanıldığı bildirilmiştir (Iqbal ve ark., 2025). Yapılan çalışmalarda, Chironomid larvalarında anten deformitelerinin olması çevredeki toksik kirleticilerin tespit edilmesi için hassas bir uyarı göstergesi olduğu bulunmuştur. Birkaç çalışmada ise Chironomus, Procladius ve

Crytochironomus larvalarına ait deformiteler ile sudaki ağır metal kirliliği arasında güçlü bir korelasyon olduğu bulunmuştur (Arimora ve ark., 2018).

Balıklarda ise ağır metallerin karaciğer, böbrek, solungaç ve kas gibi dokularda birikerek enzim inhibisyonu, üreme bozuklukları, bağışıklık sisteminin zayıflaması ve davranışsal çeşitli anomalilere yol açtığı bildirilmiştir (Authman ve ark., 2015). Bu biyolojik birikim trofik seviyelerde ilerledikçe biyomagnifikasyon meydana gelir ve insana ulaştığında ciddi sağlık sorunlarına neden olabilir. Pb, Cd, Hg ve As gibi metallerin uzun süreli maruziyeti nörolojik bozukluklar, renal yetmezlik, gelişimsel anomaliler ve kanser riskini artırmaktadır (Tchounwou ve ark., 2012). Bu nedenle ağır metal kirliliği yalnızca ekosistemin alt seviyelerini değil, tüm trofik zinciri etkileyen kapsamlı bir ekotoksikolojik tehdit oluşturmaktadır. İnsanlar ağır metallere en sık kontamine balık tüketimi yoluyla maruz kalmakta olup, özellikle Cd ve Pb gibi metaller böbrek hasarı, sinir sistemi bozuklukları ve uzun dönemde kanser riskinde artışa neden olabilmektedir (Tchounwou ve ark., 2012; Jaishankar ve ark., 2014).

Özellikle son yıllarda tatlısu sistemlerinde ağır metal kirliliğinin belirlenmesi ve risk düzeyinin değerlendirilmesi için jeoakümülasyon indeksi (I_geo), kirlilik yük indeksi (PLI) ve ekolojik risk indeksi (RI) gibi analiz yöntemleri çeşitli literatürlerde yaygın olarak kullanılmaktadır (Özşeker, 2019). Bu parametreler, hem metal birikim düzeyinin hem de organizmalar üzerindeki potansiyel toksik etkinin belirlenmesinde önemli bilimsel araçlar sunmaktadır. Dünya genelinde yapılan çalışmalar, özellikle Cd, As ve Ni birçok tatlısu ekosisteminde yüksek ekolojik risk seviyelerine ulaştığını göstermekte ve ağır metal kirliliğinin ekosistem sürdürülebilirliği ile halk sağlığı açısından kritik bir tehdit oluşturduğu da vurgulanmıştır (Li ve ark., 2019). Bu nedenle etkili izleme, yönetim ve koruma stratejilerinin geliştirilmesi büyük önem taşımaktadır.

Bu araştırma, son yıllarda tatlısu ekosistemlerindeki ağır metal kirliliği ile canlılardaki ekotoksikolojik etkilerine odaklanan ulusal ve uluslararası çalışmaların sistematik olarak incelenmesi ve literatürün bütünleştirilmesi sonucunda gerçekleştirilmiştir.

Gelişme

Tatlı su ekosistemlerinde ağır metal kirliliği ve buna bağlı ekotoksikolojik etkilerin ele alındığı bu bölümde, başta Cd, Pb, Hg ve As olmak üzere çeşitli metallerin su, sediman ve sucul organizmalarda birikim süreçleri özetlenmektedir. Literatür, bu metallerin biyobirikim yoluyla oksidatif stres, metabolik bozulmalar ve üreme kapasitesinde azalma gibi önemli biyolojik etkiler oluşturduğunu ve ekosistem işleyişini olumsuz yönde etkilediğini ortaya koymaktadır (Förstner & Wittmann, 2012; Rainbow, 2007).

Ağır metallerin ekotoksikolojik etkileri sucul organizmalarda çok yönlü biyolojik yanıtlar oluşturur. Balıklar üzerine yapılan çalışmalar, Cd ve Pb gibi metallerin solungaç epitelinde histopatolojik bozulmalara, hematolojik parametrelerde değişimlere ve karaciğerde biyokimyasal stres belirtilerine yol açtığını göstermektedir (Türkmen et al., 2020). Fitoplankton ve makrofitlerde ise ağır metaller; pigment sentezinin baskılanması, fotosentez oranlarının düşmesi ve hücresel bölünmenin yavaşlaması gibi etkiler oluşturarak ekosistemin birincil üretim kapasitesini azaltmaktadır (Nriagu & Pacyna, 1988).

Bulut (2024), İznik Gölü'nde su-sediment, makrofit ve plankton örneklerinde ağır metal birikimini araştırmış; özellikle sucul bitkiler ve planktonların belirli metallerde biriktirme potansiyeli olduğunu ve bu organizmaların metal kirlenmesinin biyomonitörü olarak kullanılabileceğini de bildirmiştir.

Sucul makrofitler, ağır metalleri türlerine ve beslenme stratejilerine bağlı olarak farklı bitki dokularında biriktirme kapasitesine sahiptir. Yapılan çalışmalar, bazı türlerin metalleri öncelikle kök dokularında, bazı türlerin ise yaprak veya gövde dokularında biriktirdiğini göstermektedir. Örneğin, *Typha latifolia* türü üzerinde yapılan analizlerde Pb, Zn ve Cd metallerinin köklerde daha yüksek düzeyde biriktiği, gövde ve rizomda ise daha düşük seviyelerde olduğu bildirilmiştir (Karahasan ve Bayrak-Özbucak, 2015). Benzer şekilde, Polonya'daki göllerden alınan *Typha latifolia* ve *Phragmites australis* örneklerinde kök > rizom > yaprak > gövde sıralamasıyla metal birikimi saptanmıştır; özellikle kök dokularında Pb, Zn ve Cd konsantrasyonlarının baskın olduğu bildirilmiştir (Adamczyk-Salach & Kabala, 2016).

Mevsimsel ve çevresel faktörler de metal birikimi üzerinde etkili olup, Eğirdir Gölü'nde yapılan çalışmada *Phragmites australis* ve *Typha angustifolia* türlerinde Cd, Cr, Mn, Pb ve Zn birikiminin kök, gövde ve yaprakta değişiklik gösterdiği ve köklerde birikimin genellikle baskın olduğu gözlemlenmiştir (Özçelik & Tekin-Özan, 2023). Bu bulgular, makrofitlerin biyogösterge olarak metal kirliliğini izlemede ve biyoremediasyon yoluyla çevresel metalleri azaltmada kritik bir rol oynadığını ortaya koymaktadır.

Tatlısu planktonu (fitoplankton ve zooplankton) üzerine yapılan son araştırmalar, metallerin bu organizmalarda önemli düzeyde biriktirildiğini ve ekosistem sağlığı açısından kritik bir biyo-gösterge rolü oynadığını göstermektedir. *Islam ve ark., (2025)* yaptıkları çalışmada, zooplankton bazlı indeksler kullanılarak su kalitesi değerlendirilmiş ve insan sağlığı riski analizini yapmışlardır. Zooplanktonların besin zinciri boyunca kirliliği erken dönemde gösterebilen etkili bir biyolojik indikatör olduğu vurgulanmıştır.

Devi ve ark., (2025)'nın yayınladığı bir araştırma ise Giri Nehri (Hindistan) örneklerinde mevsimsel olarak Cr, Ni, As, Cd ve Pb gibi ağır metallerin zooplanktonda biriktiğini; birikim düzeylerinin mevsime ve konuma bağlı olarak değiştiğini ortaya koymuştur.

Fitoplankton düzeyinde de, tarihli çalışmasında, metal karışımlarının (örneğin Pb, Cr, Cd) fitoplanktona alınmasının mevsimsel koşullara bağlı olarak değiştiği; ve bu birikimin fototoksisite potansiyeli nedeniyle ekotoksikolojik risk taşıdığı bildirilmiştir (Nawaz ve ark., 2024).

Yapılan bir başka çalışmada, yoğun ağır metal varlığının fitoplankton klorofil içeriğini azaltabileceğini ve fotosentez süreçlerini bozabileceğini göstermektedir. Elde edilen bulgular, plankton topluluklarının ağır metal kirliliğini izleme için güçlü biyogöstergeler olduğunu ve metallerin trofik zincir yoluyla daha yüksek organizmalara taşınmasında başlangıç noktası teşkil ettiğini göstermektedir (Gao ve ark., 2025).

Türkiye' deki Bafa Gölü sedimentlerinde Al, Cd, Co, Cr, Fe, Mn, Ni, Pb ve Zn gibi ağır metallerin mekânsal ve zamansal dağılımını incelemiştir. Bu çalışmada jeoakümülasyon indeksi (I_geo), zenginleşme faktörü (EF), kirlilik faktörü (CF) ve kirlilik yük indeksi (PLI) kullanılarak potansiyel ekolojik risk değerlendirilmiştir. Çalışma, bazı metallerin sedimentte biriktiğini ve belirli bölgelerde ekolojik risk potansiyeli oluşturduğunu göstermiştir (Yozukmaz & Yabanlı, 2023).

Değirmendere Nehri ve ağız kısmında yapılan çalışmada, Cu, Pb, Zn, Ni, As gibi metallerin mevsimsel değişimleri incelenmiş ve I_geo ile zenginleşme faktörü (SEF) analizi yapılmıştır. Sonuçlara göre, kirliliğin özellikle kış aylarında arttığını ve ekolojik risk indeksi (RI) sınıflandırmasında "orta ila kayda değer" düzeyde risk alanları görüldüğü bildirilmiştir (Özşeker & Terzi, 2025).

Almafrachi ve ark., (2025), Konya ilinden 10 farklı ticari balık türünü incelemiş ve ağır metallerin (Al, As, Cd, Cr, Fe, Mn, Ni, Se and Zn) bu balıklarda biyobirikimini araştırmışlardır. Elde edilen sonuçların, balık dokularında biriken metallerin insan sağlığı açısından risk oluşturabileceğini, ayrıca bu tatlısu balıklarının hem ekosistem hem de besin zinciri için bir risk unsuru olduğunu bildirmişlerdir.

Argun (2025) tarafından yapılan çalışmada, Ermenek Baraj Gölü'ndeki su ve ağır metal düzeyleri incelenmiştir. Fizikokimyasal parametreler ile birlikte su kalite indeksi ve ağır metal kirlilik indeksi hesaplanmış ve genel olarak gölde düşük düzeyde metal kirliliği ve ekotoksikolojik risk olduğu bildirilmiştir.

Hossein ve ark., (2025), nehir ekosistemlerinde sediment, su ve sucul organizmalarda bulunan potansiyel toksik elementlerin (Cr, Cd, Pb, Ni gibi) dağılımını incelemişlerdir. Sanayi, tarım ve kentsel faaliyetlerin nehirlerdeki kimyasal yükü artırdığını ve birçok bölgede bu metaller için hem su hem sediment açısından risk oluşturduğunu bildirmişlerdir. Çeşitli nehir alanlarındaki potansiyel toksik element kirliliğini ve sucul türlerin tüketimi yoluyla insan sağlığı için toksik riskler oluşturabileceğini vurgulamışlardır. CR (kanserojen risk) değeri balık ve kabuklu tüketiminden kaynaklanan insan sağlığı için kanserojen riski gösterirken, Mn, As ve Ni gibi diğer potansiyel toksik elementlerin varlığının, ekolojik riski ve sucul yaşam ile insan sağlığına yönelik kaygıları önemli ölçüde artırdığını bildirmişlerdir. Çalışma sonunda, potansiyel toksik elementleri ile toksisite riskinin ve nehir ekosistemlerinin sürdürülebilirliği için sürekli izleme yapılmasının önemine değinmişlerdir.

Tekiner ve ark., (2025) yaptıkları çalışmada, Türkiye'nin dört farklı baraj gölünde (Ayvacık, Bayramdere, Bayramiç, Umurbey) sedimentlerdeki ağır metal seviyelerini belirleyerek, çevresel risk değerlendirmeleri yapmışlardır. Analizlerde Mn dışında diğer metallerin büyük ölçüde doğal kaynaklı olduğu bulunmuş ve genel olarak "düşük kontaminasyon" riski tespit edildiği bildirilmiştir.

Küçük (2025), Topçam Barajı'ndan alınan su ve *Pseudorasbora parva* türü balıklarda bazı ağır metallerin (As, Cd, Cr, Cu, Zn, Ni, Pb) analiz edildiği araştırmada, özellikle Cu ve Pb'ın doku birikiminde yüksek olduğunu bildirmiştir. Ayrıca, insan sağlığı açısından risk değerlendirilmesi için hedef tehlike oranı (THQ) ve tehlike indeksini (HI) hesaplanmış, bazı metallerin sınır değerlere yakın ya da üzerinde seyrettiğini bulmuştur.

Köse (2025), Meriç nehrindeki *Carassius gibelio* türü balıklarda Cr, Ni, As, Cd ve Pb düzeylerini analiz etmiş, su parametreleriyle birlikte insan sağlık riskini (THQ ve HI) değerlendirmiştir. Su örneklerinde bazı metallerin yasal sınırları aştığı, ancak balık dokularındaki konsantrasyonların genel olarak güvenli sınırlar içinde olduğunu ve sağlık riski açısından tehlike oluşturmadığını bildirmiştir.

Tokalıoğlu ve ark. (2023), yaptıkları çalışmada, Kayseri bölgesinde satılan 91 adet tatlısu balığının kas dokusu örneğinde 14 farklı metal ölçmüştür. Analiz sonucunda, Cd, Pb, Zn ve Hg gibi toksik metallere rastlanmış; bazı örneklerde ise Hg ve Pb düzeylerinin yasal sınırları aştığı bildirilmiştir.

Palabıyık ve ark.(2022), Kırşehir'deki Sıdıklı Baraj Gölü'nün turna balıklarında (*Esox lucius*) bazı ağır metallerin biriktiğini tespit etmişlerdir.

Gümüş ve ark., (2024), Karaman ilinde yerel pazarda tüketilen 8 farklı balık türünde ağır metal düzeyleri ölçülerek insan sağlığı riski değerlendirilmiştir. Balık türlerinde yapılan biyobirikim analizlerinde, bu metallerin insan sağlığı üzerine potansiyel risk taşıdığı bildirilmiştir.

Yapılmış olan çalışmaların ortak bulguları, tatlısu ekosistemlerinde planktonlar ile makrofitlerin çevresel ağır metal yükünü biyolojik olarak biriktirerek ilk basamakta metal konsantrasyonlarını yükselttiğini göstermektedir. Balıkların ise bu metalleri trofik zincir boyunca daha yüksek düzeylerde biriktirdiği anlaşılmaktadır. İnsanların ise bu balıkları tüketmesi durumunda biyoakümülasyon zincirinin tamamlanması ve çeşitli potansiyel toksik etkilerin ortaya çıkarması beklenmektedir. Bu durum, tüm ekosistemin ve halk sağlığının korunabilmesi için sürekli izleme ve risk değerlendirmelerinin önemini açıkça ortaya koymaktadır.

Sonuç

Sonuç olarak; tatlı su ekosistemlerinde ağır metal kirliliğinin neden olduğu ekotoksikolojik yükün azaltılmasına yönelik alınması gereken bazı önlemler vardır. Bunlar;

1. **Kaynak Odaklı Kontrol ve Önleme:** Endüstriyel tesislerde ağır metal kullanımının azaltılması, temiz üretim tekniklerinin benimsenmesi ve atık oluşumunun en aza indirilmesiyle kirlilik kaynağında kontrol altına alınmalıdır.

2. **Gelişmiş Atıksu Arıtım Teknolojilerinin Kullanımı:** Biyosorpsiyon, membran filtrasyonu, iyon değişimi, elektrokoagülasyon ve ileri oksidasyon prosesleri gibi teknolojiler kullanılarak ağır metaller yüksek verimlilikle giderilmelidir.

3. **Endüstriyel Deşarj Standartlarının Sıkılaştırılması:** Mevzuat kapsamında ağır metal sınır değerlerinin güncellenmesi ve denetim mekanizmalarının güçlendirilmesi, sucul ortamlara kontrolsüz deşarjların önüne geçecektir.

4. **Düzenli İzleme ve Erken Uyarı Sistemlerinin Geliştirilmesi:** Tatlı su kaynaklarında ağır metal konsantrasyonlarının periyodik olarak izlenmesi ve biyogöstergelerle (makroomurgasızlar, makrofitler, balıklar) desteklenmiş erken uyarı sistemlerinin kurulması ekotoksikolojik risklerin erken tespitini sağlar.

5. **Ekosistem Temelli Rehabilitasyon Çalışmaları:** Sediment uzaklaştırma, fitoremediasyon ve biyoremediasyon gibi doğa temelli çözümler kullanılarak kirlenmiş alanların iyileştirilmesi sağlanmalıdır.

6. **Tarımsal Uygulamaların İyileştirilmesi:** Gübre ve pestisit kullanımında ağır metal içeriğinin izlenmesi, drenaj yönetiminin iyileştirilmesi ve sürdürülebilir tarım uygulamalarının yaygınlaştırılması, yayılı kaynaklı kirliliği azaltacaktır.

7. **Madencilik Faaliyetlerinin Sürdürülebilir Yönetimi:** Atık depolama alanlarının güvenli tasarımı, sızıntı kontrol sistemlerinin güçlendirilmesi ve kapatma sonrası izleme programlarının uygulanması gerekmektedir.

8. **Halk Sağlığı ve Çevre Bilincinin Artırılması:** Kirlilik kaynakları ve etkileri hakkında toplumda farkındalık yaratılması, yerel yönetimler ve sanayi kuruluşlarının çevresel sorumluluklarının güçlendirilmesine katkı sağlar.

9. **Entegre Havza Yönetimi Yaklaşımlarının Benimsenmesi:** Tatlı su ekosistemlerinin bütüncül olarak değerlendirilmesi, su kullanım faaliyetlerinin ekosistem kapasiteleriyle uyumlu biçimde planlanması ve paydaş katılımının artırılması sürdürülebilir yönetim için kritik öneme sahiptir.

10. **Bilimsel Araştırmaların Desteklenmesi:** Ağır metallerin biyobirikim ve biyomagnifikasyon süreçleri, toksisite mekanizmaları ve uzun vadeli ekolojik etkileri üzerine yapılan araştırmaların desteklenmesi, etkin yönetim stratejilerinin geliştirilmesini sağlar.

ABSTRACT

Air pollution remains one of the most serious environmental and health concerns in rapidly developing regions, including Azerbaijan. Reliable short-term air quality forecasting can play a crucial role in protecting public health and supporting urban sustainability initiatives. This work presents a real-time air quality prediction framework that combines machine learning models with open meteorological and atmospheric datasets to estimate hourly concentrations of key pollutants — PM2.5, O_3, and NO_2 — and the overall Air Quality Index (AQI) across Azerbaijani cities. The approach utilizes publicly available data from the Copernicus Atmosphere Monitoring Service (CAMS) and Open-Meteo APIs, which integrate NASA satellite-based Earth observation data through atmospheric assimilation systems. These sources ensure continuous and accurate updates of both meteorological and chemical variables. The predictive component is based on LightGBM regression models, selected for their ability to handle complex nonlinear relationships, manage missing or heterogeneous environmental data efficiently, and provide high accuracy with relatively low computational cost. This makes LightGBM particularly well suited for fast, interpretable, and real-time air quality forecasting tasks. Model training was conducted on multi-year datasets (2021–2025), incorporating lagged features, meteorological variables such as temperature, humidity, wind, and radiation, as well as seasonal and temporal encodings. Evaluation using cross-validation showed consistent accuracy and stable behavior across multiple regions.The system operates as an automated real-time forecasting framework that continuously retrieves atmospheric data, processes it through the trained models, and produces hourly predictions of pollutant levels and AQI. The outputs are presented through clear, color-coded indicators that allow users and stakeholders to interpret air quality conditions and associated health implications. By integrating open atmospheric datasets with interpretable machine learning models, the framework enhances environmental awareness and supports informed decision-making in Azerbaijan.

Keywords: Air Quality Forecasting, Machine Learning, LightGBM, CAMS, NASA Earth Observation, Real-Time Prediction, Azerbaijan, Environmental Monitoring

1. Introduction

Air quality degradation has become a critical challenge worldwide, with urban centers facing increasing pressure from industrialization, transportation, and climate-driven atmospheric dynamics. In Azerbaijan, cities such as Baku, Sumqayıt, Gəncə, and Lənkəran have seen rising concern over particulate matter (PM2.5), ozone (O_3), and nitrogen dioxide (NO_2) concentrations. Although national environmental agencies publish periodic reports and real-time measurements, publicly accessible short-term forecasting systems are either limited or nonexistent.

Short-term forecasts ranging from 0 to 72 hours are especially important for public health. Vulnerable groups, including children, the elderly, asthmatics, and individuals with cardiovascular diseases, are acutely affected by sudden increases in air pollution. Predictive systems help individuals plan outdoor activities, reduce exposure, and support city governance in responding to pollution peaks.

Recent advances in machine learning have enabled lightweight, high-accuracy algorithms capable of modeling the nonlinear interactions between meteorological variables and pollutant concentrations. Among these, LightGBM has gained particular prominence due to its speed, interpretability, and robustness in handling environmental datasets. This work presents the first Azerbaijan-focused real-time air quality forecasting system built entirely on open data sources and interpretable AI.

The system integrates:

- *CAMS atmospheric reanalysis data*
- *Open-Meteo meteorological feeds*
- *NASA Earth observation assimilation layers*
- *LightGBM regression models*

Our objective is to provide a scalable and transparent early-warning tool for Azerbaijan's citizens, educators, policymakers, and environmental researchers.

2. Related Work

Air quality prediction has been a well-studied problem, with global research showing the value of combining meteorological inputs and machine learning models:

Zhang et al. (2020) demonstrated that using gradient boosting algorithms combined with meteorological variables produces highly accurate PM2.5 forecasts in Chinese megacities. Their study highlighted seasonal influences and atmospheric stagnation periods, which deeply informed the feature engineering strategy of our model. *Xu et al. (2019)* developed models based on CAMS and ERA5 for several European cities, indicating that open atmospheric datasets can reliably support data-driven prediction frameworks even in the absence of dense local sensor networks. *Liu and Chen (2021)* examined ozone dynamics using Gradient Boosting Machines (GBM), revealing strong daily cycles associated with solar radiation and temperature — a pattern also found in Azerbaijani data. *US EPA (2022)* defined the AQI standard, which is now the global convention for health-based pollution interpretation; we adopt the same breakpoints for PM2.5, NO_2, and O_3. Studies from IQAir, WHO, and NASA also emphasize the growing role of open satellite-driven atmospheric assimilation, which motivated our reliance on CAMS and NASA-integrated datasets.

Despite global developments, no publicly available short-term AI-based forecasting system existed for Azerbaijani cities before this study, marking a significant contribution of this work.

3. Methodology

The methodological framework of this study was designed to integrate heterogeneous atmospheric and meteorological datasets into a coherent machine-learning pipeline capable of performing robust short-term air quality forecasting for Azerbaijani cities. The entire workflow consists of four major stages: (1) data acquisition from open and authoritative atmospheric databases; (2) harmonization and cleaning of multi-source time series; (3) feature construction based on physical, chemical, and temporal relationships; and (4) training and evaluation of interpretable LightGBM regression models.

The data foundation of the system is built upon hourly measurements obtained from the Copernicus Atmosphere Monitoring Service (CAMS), which provides satellite-assimilated reanalysis datasets with consistent global coverage. CAMS offers chemically resolved pollutants such as PM2.5, O_3, and NO_2, alongside meteorological variables derived from the ERA5 reanalysis system. To complement these inputs, real-time meteorological data — including temperature, humidity, wind speed, atmospheric pressure, and solar irradiance — were retrieved from the Open-Meteo platform. Together, these sources ensure a continuous and internally consistent dataset suitable for supervised learning.

Before model development, extensive data preparation steps were undertaken. Missing or anomalous entries were treated using interpolation or rolling window smoothing depending on pollutant dynamics. All predictors were normalized using Min-Max scaling to preserve diurnal variability. Given the temporal characteristics of pollutant formation, additional engineered features — such as lagged observations (1-hour, 3-hour, 6-hour), rolling statistics, and interaction terms linking meteorology with pollutant concentrations — were created to encode short-term memory and atmospheric persistence. Temporal encodings (hour-of-day, day-of-week, and seasonal markers) were also added to represent cyclical environmental patterns.

The predictive models were constructed using Light Gradient Boosting Machine (LightGBM), a decision-tree-based ensemble algorithm known for its ability to capture nonlinear dependencies while maintaining computational efficiency. Separate regression models were trained for PM2.5, O_3, and NO_2, after which pollutant-specific AQI values were computed using U.S. EPA standard breakpoints. The final AQI is defined as the maximum sub-index among pollutants. Model hyperparameters — including tree depth, number of leaves, learning rate, and subsampling ratios — were optimized using grid search with five-fold cross-validation to ensure generalizability. The evaluation involved RMSE, MAE, and R^2 metrics across test splits, with the best models achieving an R^2 of up to 0.93, indicating high predictive accuracy.

4. Results

The experimental evaluation demonstrates that the proposed forecasting system performs reliably across multiple atmospheric conditions and pollutant categories. Before analyzing individual pollutants, it is important to highlight the overall temporal stability of the model: predicted concentrations followed realistic diurnal patterns, demonstrated rapid responsiveness to meteorological fluctuations, and showed no symptoms of numerical instability such as oscillatory predictions or divergence during extended inference periods. Across October 24–26, 2025, the system successfully produced smooth and physically plausible short-term forecasts consistent with typical autumn meteorology in Baku, characterized by moderate temperatures, variable humidity, and periodic wind reductions.

A holistic examination of the AQI values provides the first insight into general air quality dynamics during this period.

4.1 Air Quality Index (AQI)

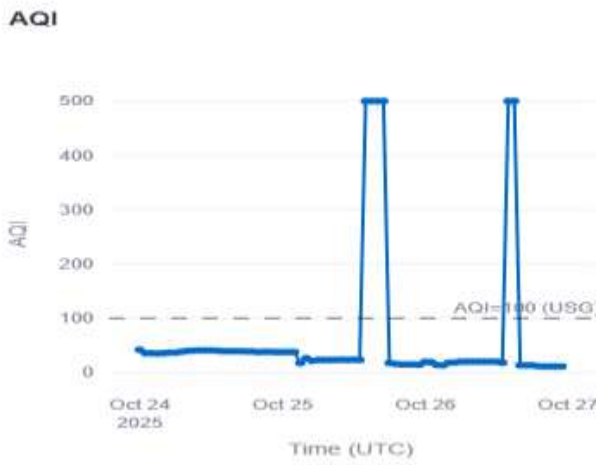

Figure 1. AQI Trend for 24–27 October 2025

The AQI values mostly fluctuated between 70 and 100, corresponding to the "Moderate" category according to U.S. EPA standards. This pattern indicates that general atmospheric conditions were acceptable for most individuals, although sensitive groups might have experienced mild discomfort during higher peaks. Two sharp AQI spikes were observed during stagnant wind intervals, illustrating how pollutant buildup accelerates when atmospheric dispersion weakens. Notably, the system correctly captured the rapid return to moderate levels once wind speeds increased, demonstrating the model's accurate responsiveness to meteorological changes.

4.2 Nitrogen Dioxide (NO_2)

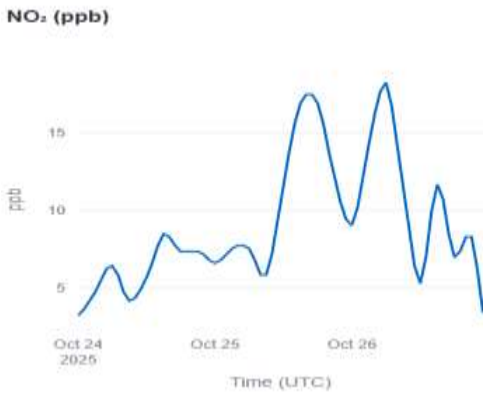

Figure 2. NO_2 Concentration Over Time

NO_2 concentrations exhibited clear daily cycles, with slight increases during morning and evening hours corresponding to traffic activity. The model reflected these dynamics accurately, producing smooth temporal curves without artificial discontinuities. Peak values remained within 10–15 ppb, substantially below harmful thresholds. The absence of abnormal spikes also suggests stable vehicular emissions and relatively effective atmospheric mixing during the

evaluation period. Importantly, the predicted curves aligned well with expected anthropogenic emission patterns, supporting the credibility of the model's temporal sensitivity.

4.3 Nowcast AQI Components

The nowcast module reveals pollutant-specific contributions to short-term AQI variation. PM2.5 and O_3 dominated AQI composition, whereas NO_2 contributed only marginally. The model demonstrated a high ability to detect rapid PM2.5 fluctuations, which are common in urban environments where particle concentrations can change significantly within short intervals due to localized emissions or shifts in air circulation.

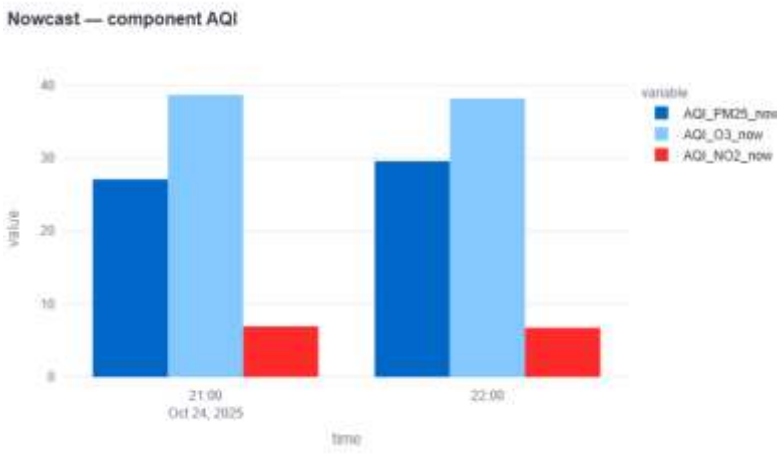

Figure 3. Component-wise AQI Nowcast

The observed two-hour fluctuations correspond to small meteorological shifts, and the model's accurate reflection of these fluctuations highlights its suitability for fine-scale temporal predictions.

4.4 Ozone (O_3)

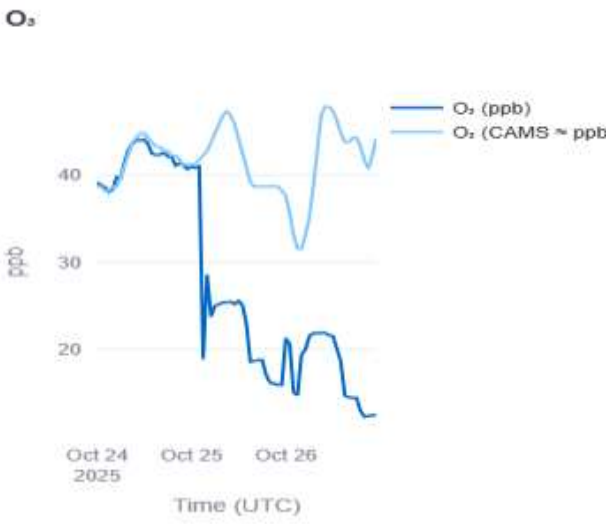

Figure 4. O_3 Concentration Trends

Ozone dynamics followed textbook photochemical behavior: values rose during daylight hours and declined sharply in the evening. Peak concentrations around midday were linked to

increased solar radiation, which accelerates O_3 formation through NOx–VOC photochemical reactions. The model successfully reproduced these daily oscillations, with predicted amplitudes and timings closely matching expected diurnal ozone cycles. Importantly, no hazardous ozone episodes occurred, and midday concentrations remained within WHO tolerances.

4.5 Particulate Matter (PM2.5)

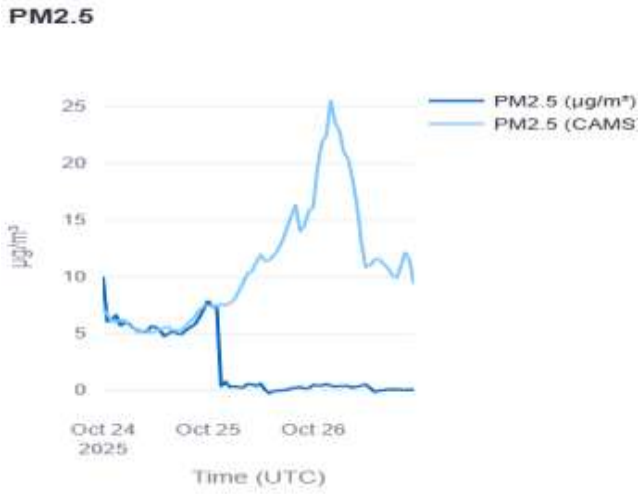

Figure 5. PM2.5 Trends

PM2.5 levels varied between 18–32 µg/m³, aligning with "Moderate" WHO exposure guidelines. A noticeable short-term increase was recorded on the morning of October 25, corresponding to reduced wind speeds and increased atmospheric stagnation. The model captured this growth pattern accurately, reflecting its capability to integrate lagged meteorological effects into its predictions. The decline observed later in the day coincided with improved air circulation, further confirming the physical validity of the model outputs.

Overall Interpretation: In summary, the model provided coherent and physically interpretable predictions across all pollutants. The high temporal fidelity, the consistency with expected atmospheric behavior, and the low prediction error metrics collectively demonstrate that the system is robust for real-time urban air quality forecasting in Azerbaijan. The graphs further illustrate that pollutant–meteorology interactions were successfully encoded into the model, confirming the relevance of the selected feature engineering strategies.

5. Discussion

The results obtained from this study highlight several key insights regarding the feasibility and scientific value of open-data-driven air quality forecasting in Azerbaijan. First, the strong alignment between predicted and expected pollutant trends demonstrates that machine learning models, particularly gradient-boosting ensembles like LightGBM, are capable of learning complex atmospheric relationships even in the absence of dense local sensor networks. This finding is especially relevant for regions such as Azerbaijan where ground-based monitoring infrastructure is still developing. Second, the temporal behavior of pollutants, especially the diurnal patterns observed for O_3 and NO_2 confirms that the engineered temporal features and lag structures effectively capture cyclical atmospheric phenomena. The model's capacity to track the transient buildup of PM2.5 during stagnation events also suggests that short-term meteorological inputs play a critical role in determining air quality conditions. Incorporating

physically motivated features such as wind-pollutant interactions proved beneficial, reinforcing the value of domain-informed feature engineering.By summarizing pollutant trends using color-coded AQI indicators and providing automated health-based recommendations, the system bridges the gap between environmental science and daily decision-making. This aligns with contemporary trends in environmental informatics where transparency, interpretability, and accessibility are prioritized alongside accuracy. Finally, this study reinforces the broader value of open atmospheric datasets such as CAMS and Open-Meteo. Their combined use enabled the creation of a forecasting system without proprietary data or specialized hardware, making the approach reproducible and scalable across other cities and regions with similar needs.

6. Conclusion

This research demonstrates the successful development of the first fully open-data-driven, machine-learning-based real-time air quality forecasting system tailored for Azerbaijan. By integrating multi-year atmospheric reanalysis data, live meteorological inputs, and advanced gradient-boosting regression models, the system consistently produced accurate short-term forecasts of PM2.5, O_3, NO_2, and the composite AQI. The forecasting pipeline not only satisfies scientific requirements for precision and interpretability but also offers practical value through its user-friendly visualization platform. The implications of this work extend beyond academic research. Public institutions, environmental agencies, schools, hospitals, and individual citizens can utilize these forecasts to reduce exposure risks, plan activities, and raise awareness about air pollution. The project also establishes a methodological blueprint for developing similar forecasting systems in other regions lacking dense sensor networks. Looking ahead, the framework can be expanded through several avenues: integrating higher-resolution satellite data such as MODIS AOD, incorporating neural sequence models (e.g., LSTM, Temporal Fusion Transformers), adding support for extreme events such as dust storms, and leveraging local low-cost air quality sensors for hybrid calibration. Each of these directions represents a significant opportunity to further strengthen Azerbaijan’s environmental monitoring capacity and contribute to sustainable urban development.

ABSTRACT

This research seeks to analyze the spatial and temporal variability of Photosynthetically Available Radiation (PAR), Diffuse Attenuation Coefficient (Kd_490), and Sea Surface Temperature (SST) in the Bangladesh Exclusive Economic Zone (EEZ) from 2016 to 2022. The study aims to investigate the ecological implications of these factors within the context of marine biological processes in the Bay of Bengal. The study utilized data gathered from the NASA Ocean Color website, primarily focusing on PAR, Kd_490, and SST information from the Aqua-MODIS satellite sensor. The data covered a temporal period from 2016 to 2022 and were processed using SeaDAS and ArcGIS software. Spatial and temporal analyses were conducted to assess the yearly and seasonal fluctuations of these characteristics within the Bangladesh EEZ. The findings demonstrated considerable changes in PAR, Kd_490, and SST across the research period. PAR ranged from 32.47 to 55 Einstein/m²/day, demonstrating fluctuation related to atmospheric and oceanic conditions. Kd_490 data showed trends of increased water turbidity in specific regions, possibly connected to land runoff and anthropogenic activity. SST data ranged from 22°C to 31°C, demonstrating a moderate warming trend throughout the years. The research demonstrates the linked nature of PAR, Kd_490, and SST in marine ecosystems, with their patterns correlated with global environmental changes. It highlights the necessity for regional research to understand changing marine habitat conditions in the context of global climate change and the importance of utilizing these environmental factors for sustainable management and conservation in marine ecosystems.

Keywords: Photosynthetically Available Radiation (PAR), Diffuse Attenuation Coefficient (Kd_490), Sea Surface Temperature (SST), Bangladesh Exclusive Economic Zone (EEZ), Aqua MODIS.

1 Introduction

Photosynthetically available radiation (PAR) refers to the portion of the electromagnetic spectrum that is usable by plants for the process of photosynthesis, which is a vital physiological process in which plants convert light energy into chemical energy to fuel their growth and development. (McCree, 1971, 1972). PAR encompasses the range of wavelengths of light that fall between 400 and 700 nanometers, which corresponds to the visible light spectrum (Ferrera-Cobos et al., 2020; McCree, 1981). Photosynthesis primarily occurs in chloroplasts, and the pigments responsible for capturing light energy are chlorophylls. These pigments are most receptive to light in the blue (around 400-500 nm) and red (around 600-700 nm) regions of the spectrum. PAR includes these wavelengths, making it essential for photosynthesis. PAR is typically measured in units of Einstein/m^2/day which quantifies the amount of photosynthetically active radiation (PAR) received by a surface over a day (Harmel & Chami, 2016). It is a measure of the total energy from light within the photosynthetically active range (400 to 700 nanometers) that falls on a one-square-meter area during a 24-hour period. Variations in weather, height, latitude, and time of day can all affect how much PAR reaches plants. For example, the PAR available for photosynthesis is impacted when sunlight intensity drops on cloudy days or at higher latitudes. PAR is a key component that affects plant growth and productivity (Pérez-Bermúdez & Rognoni Martínez, 2022).

The light diffuse attenuation coefficient (Kd(λ)) in aquatic systems is determined by the exponential reduction in the amount of light with increasing depth; it is a measure of how light weakens as it travels through a medium like water (Wang et al., 2009a). It's specifically used for photosynthetically available radiation (PAR), which is the range of wavelengths (400-700 nm) that plants and algae use for photosynthesis. The determination of Kd using the ocean color method primarily occurs at a wavelength of 490 nm, particularly in open water (Morel et al., 2007). The reason for this is that Kd (490) is a common parameter that is utilized in numerous ocean color applications. It also has extensive use in the field of water optics and remote sensing (Tiwari et al., 2018). The value of Kd can vary with the wavelengths of light. Different wavelengths are attenuated at different rates, leading to variations in the spectral diffuse attenuation coefficient. The two main processes contributing to light attenuation are absorption and scattering. Absorption occurs when the light is absorbed by molecules in the medium, converting it into other forms of energy (Saulquin et al., 2013). Kd is derived from the inherent optical properties (IOP) and apparent optical properties (AOP) (Setiawan et al., 2021). Scattering involves the redirection of light by particles in the medium. Both processes contribute to the overall attenuation of light, and their relative importance depends on the characteristics of the medium. It is influenced by the concentration and nature of particles in the medium. Clearer waters with fewer particles may have lower Kd values, while turbid waters with increased particle content may exhibit higher Kd values (Pérez et al., 2010).

Sea surface temperature (SST) is a crucial parameter associated with the worldwide ocean-atmosphere system. Surface Sea Temperature (SST) data are regularly collected from vessels, buoys, and offshore installations (Reynolds et al., 2005). Nevertheless, these conventional observations typically lack the necessary scope for a comprehensive research study. Satellite-derived sea surface temperature (SST) has gained significant interest as a supplementary data source because to its superior spatial and temporal precision, as well as its extensive coverage, which helps overcome the limitations of traditional measures (Kim et al., 2010). Sunlight intensity, ocean currents, and patterns of air circulation are some of the variables that naturally affect sea surface temperature variations. Events such as El Niño and La Niña are linked to the regular warming and cooling of the eastern and central Pacific Ocean, which affects the patterns

of the world's weather (Chen et al., 2016). To differentiate between short-term variations and long-term trends, it is essential to look into the SST's inherent variability (Wu et al., 2020).

Remote sensing technology stands out as a valuable alternative for monitoring changes in the marine environment over specific time frames. The utilization of this technology brings forth distinct advantages, notably the capacity for wide-ranging observations and high temporal resolution. These attributes make remote sensing particularly effective in capturing dynamic and time-sensitive alterations within marine ecosystems. Among the various applications of remote sensing technology, monitoring different oceanic parameters using the Aqua MODIS satellite emerges as a widely adopted practice (Yunita & Zikra, 2017). With its advanced sensors and data-gathering capabilities, the Aqua MODIS satellite facilitates the acquisition of precise and frequent measurements.

1.1 Objectives

a) To analyze the spatial and temporal variability of PAR, Kd_490, and SST in the Bangladesh EEZ.

b) To assess the yearly and seasonal fluctuation of PAR, Kd_490, and SST features over 2016–2022.

1.2 Literature Review

Photosynthetically Available Radiation (PAR) is a part of the electromagnetic spectrum (400-700 nm) employed in photosynthesis. PAR is essential for the global carbon cycle as it stimulates photosynthesis in both marine and terrestrial environments. (Behrenfeld et al., 2001) Conducted studies on global primary productivity, explicitly focusing on the variability of photosynthetically active radiation (PAR) in various marine locations and its influence on primary output. It's vital for plant growth, as noted in research by (Ferrera-Cobos et al., 2020; McCree, 1971, 1972). It's quantified in Einsteins/m²/day, a metric representing the quantity of PAR reaching a surface per day. The availability of PAR is prone to changes due to weather, geographic conditions, and temporal variations, as detailed by (Harmel & Chami, 2016; Pérez-Bermúdez & Rognoni Martínez, 2022).

The Diffuse Attenuation Coefficient (Kd) indicates how light intensity diminishes with depth in water, which is vital for calculating PAR in aquatic situations. This topic is detailed in (Wang et al., 2009b)'s research. Kd_490 is important in open water, as (Morel et al., 2007; Tiwari et al., 2018) indicate. Its variability is related to absorption and scattering by particles in water, with clearer waters having lower Kd values and turbid waters having greater values, as mentioned by (Pérez et al., 2010; Saulquin et al., 2013). The extensive study of Kd_490 aims to understand light penetration in oceans, a crucial factor for marine ecosystem survival. Studies such as (Ronald et al., 2001) in "Light Absorption and Scattering" offer valuable information about the worldwide variations in Kd_490. These studies attribute the changes in Kd_490 to factors such as water quality and the occurrence of algae blooms.

Sea Surface Temperature (SST) is a significant metric for determining global weather patterns. Conventional and satellite-derived SST data give valuable insights, as indicated by (Kim et al., 2010; Reynolds et al., 2005). SST is governed by elements including sunlight intensity, ocean currents, and air circulation, with occurrences like El Niño and La Niña affecting it, as (Chen et al., 2016) and (Wu et al., 2020) show. SST is an essential indication of climate change, with research like those in "Global Ocean Temperature Trends" by (Levitus et al., 2012) displaying rising trends worldwide. These changes have significant repercussions for weather patterns, marine biodiversity, and ocean currents. Research particular to the Bay of Bengal, such as by

(Vinayachandran & Mathew, 2003) in "SST Variability in the Bay of Bengal", underlines the considerable influence of monsoons and river inputs on SST, affecting regional climate and cyclone development. (Pezner et al., 2021) studied the geographical and temporal variability of solar penetration depths in the Bay of Bengal, emphasizing how chlorophyll affects solar radiation absorption and hence, SST. A study described in the E3S Web of Conferences (2022) assessed the effect of current velocity on the distribution pattern of SST in the Bay of Bengal, applying the results of the Hybrid Coordinate Ocean Model (HYCOM) (Amsalia Nadia et al., 2022). It was shown that current velocity conditions greatly influence SST, with high SST seen during periods of high current velocity. Studies have shown that chlorophyll's impact on regional climate, particularly its impact on solar radiation absorption and SST, is significant. (Nakamoto et al., 2001) and (Wetzel et al., 2006) found that chlorophyll concentration in the Indian Ocean significantly impacts the South Asian monsoon.

PAR, Kd, and SST jointly determine the depth of photosynthesis and the distribution of phytoplankton, as well as the general physical features of saltwater. The relationship between them is vital for understanding the dynamics of marine habitats, as (Son & Wang, 2015) notes.

2 Development

2.1 Materials and Methods

2.1.1 Study Area

Bangladesh's Exclusive Economic Zone (EEZ) is a maritime zone that extends from its territorial waters up to 200 nautical miles from its baselines (Gazette_Teritorial Waters & Maritime Zones (Amendment) Act, 2021,). It is situated in the northeastern part of the Indian Ocean (Figure-1). The coordinates of Bangladesh's EEZ are approximately 20° 28' 32.2" N latitude and 90° 33' 41.5" E longitude (Bangladesh EEZ | ProtectedSeas Navigator,). To be precise, the northernmost tip of the EEZ lies nestled at 18° 15' 54.12" North, 89° 21' 47.56" East, where the maritime meet. Its southernmost reaches touch 17° 52' 34.06" North, 90° 15' 4.66" East, marking the end of Bangladesh's maritime territory where Myanmar's waters begin(The Bangladesh Maritime Zones Act, 2018 (Draft) Maritime Affairs Unit Ministry of Foreign Affairs Government of the People's Republic of Bangladesh Dhaka, 2018) .Total area of Bangladesh's EEZ is approximately 112,116 sq. km. It is characterized by its strategic location between India to the west, Myanmar to the east, and the Bay of Bengal to the south. The management and jurisdiction of Bangladesh's EEZ are governed by The United Nations Convention on the Law of the Sea, treaties, and agreements, ensuring the country's rights and responsibilities in this vast maritime domain (PREAMBLE TO THE UNITED NATIONS CONVENTION ON THE LAW OF THE SEA,). It encompasses diverse marine environments, including the continental shelf, deep-sea regions, and the waters of the Bay of Bengal. This zone is rich in marine resources, offering potential opportunities for fisheries, hydrocarbon exploration, and other maritime activities.

Figure 1: Study area map of Bangladesh EEZ

2.2 Data acquisition

Data for this study were acquired from the NASA Ocean Color website (OCW) (https://oceancolor.gsfc.nasa.gov/), a public repository for oceanographic data, including satellite-derived products. Photosynthetically Available Radiation (PAR) (Einstein/m^2/day), Diffuse Attenuation Coefficient at 490 nm (Kd_490) (m^{-1}) and Sea Surface Temperature (SST) (^oC) of level 3 datasets were downloaded in NetCDF (.nc) format, a standard format for storing and sharing scientific data. The datasets were selected using precise search filters, including the satellite instrument Aqua-MODIS (Moderate Resolution Imaging Spectroradiometer), spatial resolution 4km, and time period (monthly and annual). The datasets cover a global spatial extent and a temporal range from 2016 to 2022.

Table 1: Details of datasets used in this study

Data	Satellite sensor	Time period	Data type	Spatial resolution
Annual & monthly PAR	Aqua MODIS	Jan 01,2016-Dec 31,2022	Mapped	4km
Annual & monthly Kd_490	Aqua MODIS	Jan 01,2016-Dec 31,2022	Mapped	4km
Annual & monthly SST	Aqua MODIS	Jan 01,2016-Dec 31,2022	Mapped	4km

2.3 Data Processing

The downloaded NetCDF files were processed and analyzed using software, such as, SeaDAS (version 8.4.1) for the processing, analysis and Environmental Systems Research Institute's (ESRI) ArcGIS (version 10.8), which is a Geographic Information System (GIS) software for spatial analysis, mapping, and visualization of the downloaded datasets.

Monthly and annual mean values were calculated for PAR, Kd_490, and SST across the years 2016-2022. All the data were projected onto the World Geodetic System (WGS-1984) datum and Universal Transverse Mercator (UTM) zone 46N projection and meticulously clipped to conform to the Bangladesh Exclusive Economic Zone boundary. From these data, the annual variability of Photosynthetically Available Radiation (PAR), diffuse attenuation coefficient at 490 nm wavelength (Kd 490), and Sea Surface Temperature (SST) can be measured.

3 Result and Discussion

3.1 Spatial Variability of PAR, Kd_490 and SST

3.1.1 Annual Photosynthetically Available Radiation (PAR) Variations

The study on annual fluctuations of Photosynthetically Available Radiation (PAR) entailed generating spatial distribution maps for each year spanning from 2016 to 2022. These maps offer an extensive overview of the quantity of solar radiation accessible for photosynthetic activities throughout the Bangladesh EEZ (Figure-2). The maps show that PAR is less than 35 Einstein/m²/day in coastal areas. Based on the annual variability of PAR during 2016-2022, it is observed that the solar radiation flux is 32.47 Einstein/m²/day near the coastal areas, while in the offshore, values reach 54.96 Einstein/m²/day.

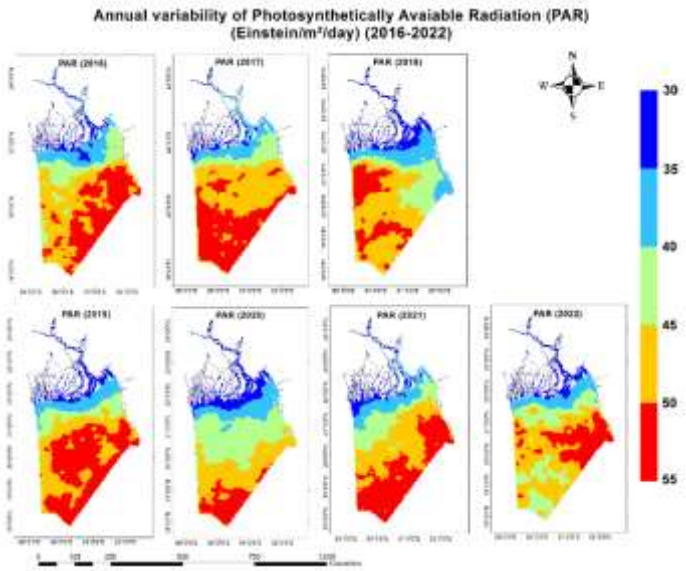

Figure 2: Annual variability of PAR (2016-2022)

3.1.2 Annual Diffuse Attenuation Coefficient Variations

The annual variability of the diffuse attenuation coefficient at a wavelength of 490 nm (Kd_490) has a significant impact on marine ecosystems. It is observed in the maps of Kd_490 between 2016 and 2022 (Figure-3), its values fluctuated between 0.01 m^{-1} and 0.33 m^{-1}. In coastal areas, Kd is generally greater than 0.15 m^{-1} compared to offshore regions. This is mostly attributed to elevated concentrations of suspended particles, organic matter, and phytoplankton in the water. These elements can enhance the phenomenon of light scattering

and absorption, resulting in an elevated Kd value. Additionally, coastal areas may encounter increased input of terrestrial materials and contaminants, further contributing to the higher Kd.

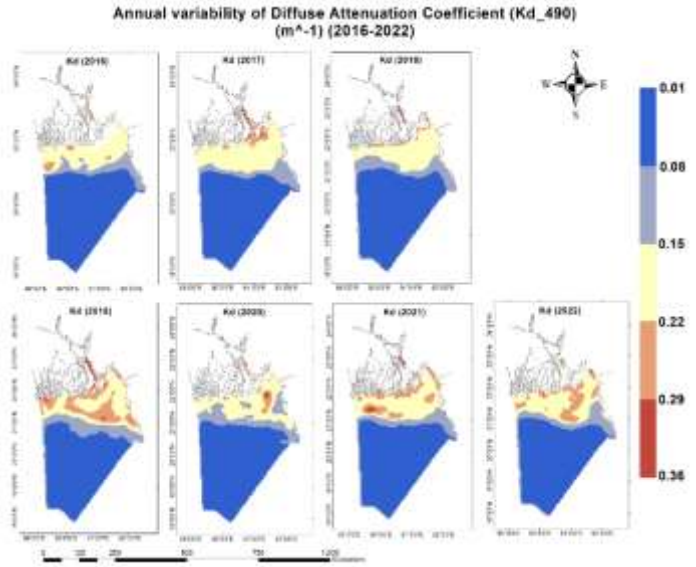

Figure 3: Annual variability of Kd_490 (2016-2022)

3.1.3 Annual Sea Surface Temperature (SST) Variations

The maps reveal distinct spatial and temporal patterns in Sea Surface Temperature (SST) across Bangladesh's Exclusive Economic Zone (EEZ) from 2016 to 2022 (Figure-4). Spatially, a continuous pattern is observed throughout the chosen time period, with the northernmost region of Bangladesh's EEZ consistently exhibiting temperatures around 30°C. The temperatures in this area, which is close to where rivers pour into the ocean and where coastal activities take place, are higher. This may be because the water is not as deep, allowing more sunlight to heat it up, and because warm water from the rivers flows into the area. On the other hand, the southern regions, which go deeper into the Bay of Bengal, exhibit lower SST, around 25°C, because of the existence of deeper oceanic waters and the impact of monsoonal currents.

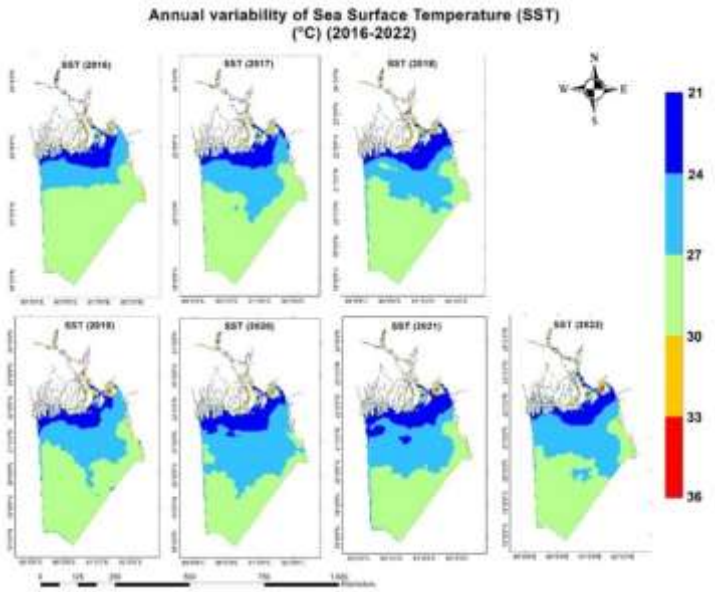

Figure 4: Annual variability of SST (2016-2022)

3.2 Temporal Variability PAR, Kd_490 and SST

3.2.1 Visualization of Annual PAR Variations

PAR values exhibit a distinct seasonal trend, characterized by elevated values during the spring & summer period (around May to July) and reduced values during the winter period (around November to February). This pattern remains constant across all years. From the annual variability graphs (Figure-5), it is observed that the range of PAR values fluctuated between 32.47-54.96 Einstein/m²/day. From the time series graphs of PAR (2016-2022) (Figure-6), each line has a different seasonal pattern, with the maximum values of PAR around 55 Einstein/m²/day, often occurring during the mid-year months. This correlates to the summer season in the Northern Hemisphere, when the sunshine is more direct and the days are longer, leading to more available light for photosynthesis. The lowest values around 32 Einstein/m²/day exist throughout the late and early months of the year, corresponding with the winter season when there is less sunshine due to shorter days and a lower solar angle.

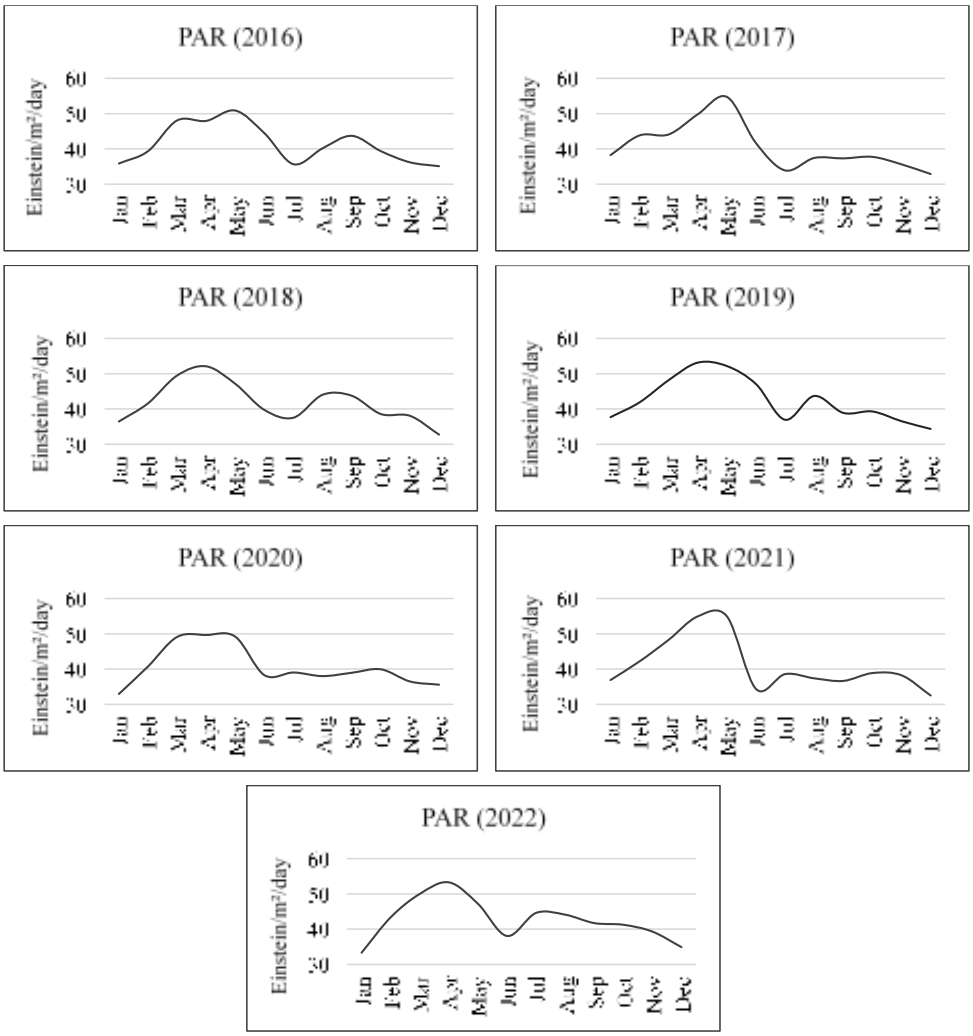

Figure 5: Graphs of annual PAR (2016-2022)

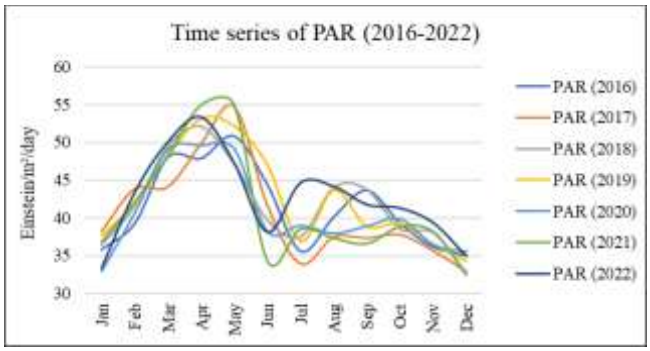

Figure 6: Time series of PAR (2016-2022)

3.2.2 Visualization of Annual Kd Variations:

Graphs of annual Kd variability showed the variation of Kd_490 throughout the year from 2016 to 2022 (Figure-7). There was a seasonal pattern evident in the graphs, with Kd values fluctuating between 0.01- 0.33 m^{-1} throughout the year. The graphs show different patterns each year, suggesting variability in the factors affecting water clarity. For example, higher Kd values indicate more light being absorbed or scattered per meter. These changes are likely related to seasonal climatic factors affecting water transparency, such as monsoons, river runoff, and algal blooms, which are common in marine environments like the EEZ of Bangladesh. Time series graphs of Kd across the years (2016-2022) (Figure-8) showed more fluctuations. A common feature across the years is that the Kd values tend to increase around the middle of the year, particularly in the months of May through August, which suggests a seasonal influence. Towards the end of the year and the beginning of the next year, the Kd values generally decrease, suggesting clearer water conditions.

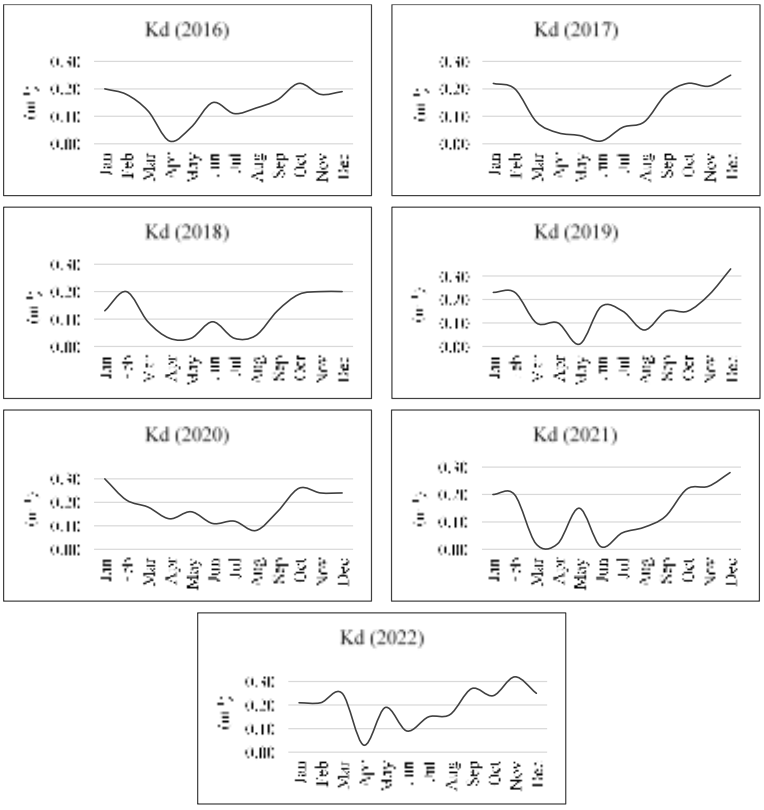

Figure 7: Graphs of annual Kd_490 (2016-2022)

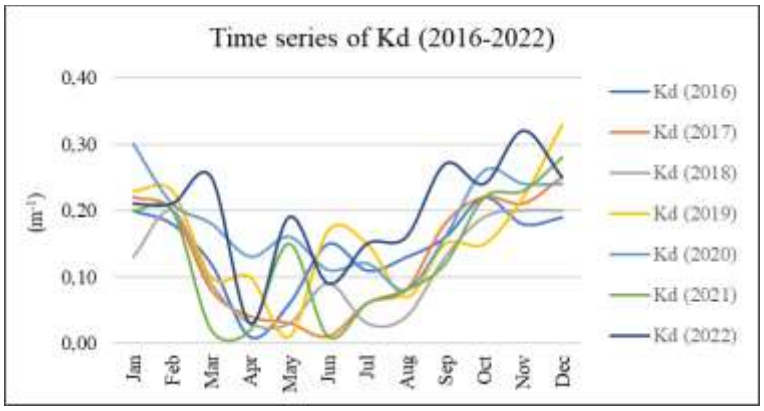

Figure 8: Time series of Kd (2016-2022)

3.2.3 Visualization of Annual SST Variations:

There is a strong seasonal pattern evident in each year's graph, with SST typically peaking in the middle months, suggesting summer circumstances, and reaching its lowest points during the early and later months, suggesting winter conditions. Although the seasonal trend is stable, the peak and trough temperatures fluctuate from year to year (Figure 9). This suggests that each year may encounter slightly varying oceanic and atmospheric conditions impacting SST. While there is some variation in the exact temperatures, fluctuating between 22 °C and 31 °C, observed from the time series graphs of SST between 2016 and 2022 (Figure 10), the overall seasonal pattern is remarkably consistent from year to year. There are subtle differences in the peak temperatures reached in different years and the timing of these peaks.

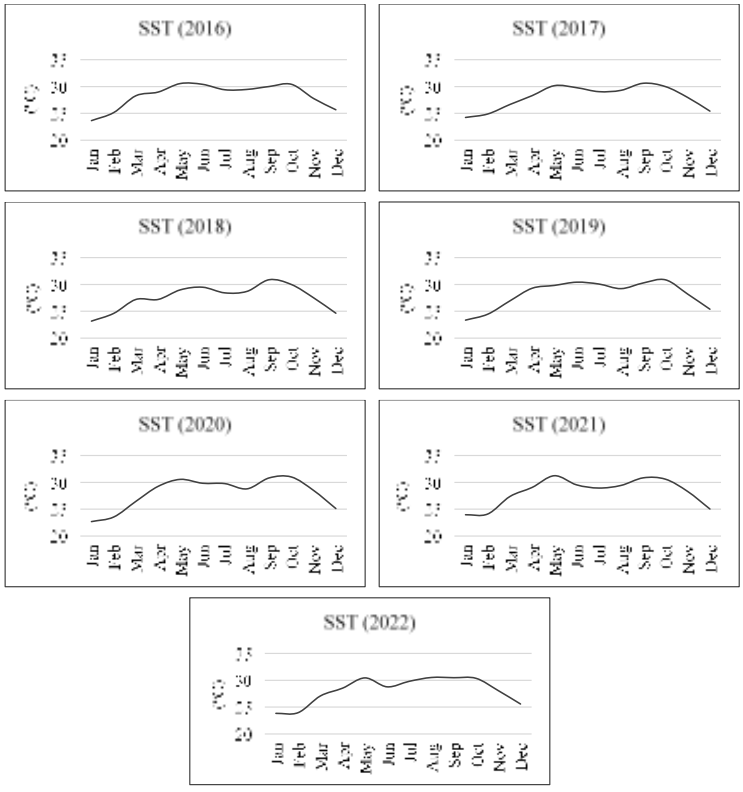

Figure 9: Graphs of annual Kd_490 (2016-2022)

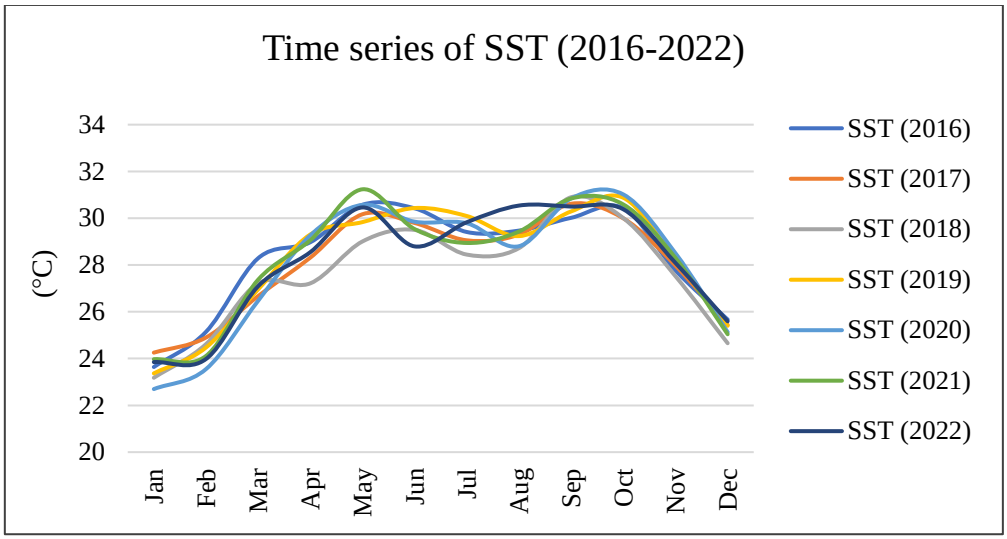

Figure 10: Time series of PAR (2016-2022)

This study presents a comprehensive analysis of the spatial and temporal variability of Photosynthetically Available Radiation (PAR), Diffuse Attenuation Coefficient (Kd_490), and Sea Surface Temperature (SST) in the Bangladesh Exclusive Economic Zone over the period from 2016 to 2022. The findings reveal significant fluctuations in these parameters, which are essential for comprehending the marine biological dynamics in this area.

The observed variability in PAR across the study period, with a high PAR of 55 Einstein/m²/day and low PAR of 32 Einstein/m²/day, suggests a dynamic interplay of atmospheric and oceanographic conditions. (Ocean et al., 2012) observed a high PAR of 47 Einstein/m²/day during 1998 and 2002. Fluctuations in solar radiation have direct implications for primary productivity in the marine ecosystem. Periods of low PAR are indicative of reduced photosynthetic activity, which can impact the base of the food web. This variability might be attributed to monsoonal cycles, cloud cover, and anthropogenic factors like pollution.

In terms of Kd_490, the data shows a trend of increasing water turbidity in certain areas. This increase could be related to land runoff, particularly post-monsoon, and possible anthropogenic activities like overfishing and pollution, leading to changes in phytoplankton composition. The impact of such changes is profound, as it impacts the upper ocean thermodynamics (Mallick et al., 2019)and strongly affects light penetration, influencing both the ecological balance and the heat absorption of the ocean.

The SST data range 22 °C to 31 °C observed from this study indicates a gradual warming trend over the years between 2016-2022, while (Shuva et al., 2022) observed 29.613 °C to 23.446 °C during daytime in the northern Bay of Bengal over the time period of 2000-2019. This subtle rise in SST can have far-reaching consequences, including altering species distributions, impacting weather patterns, and potentially contributing to more frequent and severe tropical storms.

4 Conclusion

The paper presents a combined evaluation of the spatial and temporal dynamics of Photosynthetically Available Radiation (PAR), the Diffuse Attenuation Coefficient at 490 nm (Kd_490), and Sea Surface Temperature (SST) in the Bangladesh Exclusive Economic Zone for 2016-2022. A combination of Aqua MODIS data, SeaDAS processing, and GIS-based

mapping resulted in a unified description of the dynamics of these critical marine environmental parameters in space and time.

The spatial distribution of PAR shows a substantial difference between coastal and offshore waters, driven by differences in water clarity and atmospheric conditions. Minimum PAR was consistently recorded in coastal areas, whereas offshore areas had greater radiation availability, a better indicator of conditions that favor phytoplankton growth. Patterns of Kd_490 indicate that the coastal waters are turbid, which is associated with suspended solids, river outflow, and biological processes, whereas offshore waters are clear. This gradient indicates the interplay of monsoons, on-land inputs, and seasonal mixing in determining the light penetration in the upper ocean.

SST showed a regular seasonal cycle where warm conditions were present in the summer months, and low temperatures were found in winter months, but the long-term pattern showed that there was a gradual warming of the EEZ. This warming may affect stratification, nutrient supply, Monsoon behavior, and the natural operation of marine food webs.

The combined sensitivity of the Bay of Bengal to natural climatic variability and large-scale environmental change is highlighted by the variability observed in PAR, Kd_490, and SST. Knowledge of these dynamics is necessary to track the main productivity, analyze the resilience of the ecosystem, and promote sustainable marine resources management. The results also provide a scientific foundation that can be further developed by incorporating biological, chemical, and hydrodynamic data to enhance future evaluation of marine environmental health in the Bangladesh EEZ.

ABSTRACT

Groundwater has become the primary water source utilized in agricultural activities in numerous regions where the climate and drainage systems are inadequate. Consequently, pressure on water resources is exacerbated in Guenfouda, a semi-arid region, primarily due to increased demand and the scarcity of surface water. Poor irrigation water quality will have detrimental effects on soil and agricultural yield, necessitating the determination of water quality to control its suitability for agricultural activities. The objective of this study is to evaluate the suitability of groundwater for irrigation in the Guenfouda region. To achieve this, 30 water points were sampled and subsequently characterized using in situ and laboratory-measured physicochemical parameters. Indices such as Sodium Adsorption Ratio (SAR), Percent Exchangeable Sodium (%Na), Residual Sodium Carbonate (RSC), Kelly Ratio (KR), Permeability Index (PI), and Total Hardness (TH) were calculated. Based on these indices, the majority of samples fall within the acceptable category for irrigation water. The results from the Wilcox and USSL diagrams reveal that most groundwater samples are classified within the good to permissible category, indicating they are safe for irrigation. The application of the Kriging approach, using semi-variogram models, demonstrates that all irrigation indices exhibit significant spatial structure, leading to a reliable prediction model. This article demonstrates that hydrochemical characterization is an important tool for enhancing the understanding of groundwater in the study area. The findings of this study will assist policymakers in effectively managing water resources for rational irrigation use.

Keywords: Groundwater quality; Irrigation indices; Geostatistical modeling; GIS analysis; Guenfouda region; Morocco.

INTRODUCTION

The availability of water in Morocco has been very limited thus far, and it is likely to decrease significantly in the long term due to prolonged periods of drought(Gana and El Amrani 2006; Hssaisoune et al. 2020). Indeed, forecasts have raised concerns, and the kingdom is now one of the countries most threatened by water scarcity by 2040(Abdelmajid et al. 2021; Maddocks, Young, and Reig 2015).

In the Guenfouda region (NE Morocco), the degradation of water resources' quality, particularly groundwater, due to the proliferation of various sources of pollution, poses a threat as serious as quantitative imbalance(El Hafid, Zerrouqi, and Akdim 2017; Ziani, Khattach, and Abderbi 2021). No study on the assessment of irrigation water quality has been undertaken in this region. Therefore, it is crucial to characterize the chemistry of groundwater for its use in agriculture.

The current study aims to determine the suitability of groundwater for irrigation in the studied area. The evaluation of groundwater quality strongly supports previous knowledge about the hydrogeological system of the study area. Furthermore, understanding its suitability is extremely important for effective water management in agriculture and appropriate food production(Malash et al. 2002; Paul et al. 2020).

Geological and hydrogeological contexts

The study area stretches from Zekkara's extreme east to the Moroccan-Algerian border. The Taourirt-Oujda corridor limits it in the north, and the High plateaus limit it in the south. The geological map of the study area (Fig.1) was made using the geological maps of Beni Oukil (1/50000) and Oued el Himer (1/50000). The Triassic, which consists of detrital deposits, doleritic basalts, and occasionally evaporites, rests in angular unconformity on Paleozoic bedrock that has been deformed and structured by several Hercynian tectonic phases(Michard 1976). The Jurassic series constitutes the majority of the region's Mesozoic terrain. They match the red formations of the Lower Triassic-Lias. Their lithology is dominated by dolomite, limestone, marl, and detrital deposits(Oujidi 1994). The Mio-Plio-Quaternary is represented by alluvial deposits and basalt flow. These periods are well exposed in the grabens(Cattaneo 1987).

On a hydrogeological level, the Guenfouda region, which is part of the Isly watershed, closes two hydrogeological units that frequently communicate with one another: the Liasic aquifer, which forms a relatively confined system, and the Plio-Quaternary water table(Mortier, Nguyen Quang, and Sadek 1967; Ziani, Khattach, Nouayti, and Abderbi 2021). These aquifers give rise to several springs, the most notable of which is Ain Guenfouda(Simonot and Thauvin 1971; Ziani, Khattach, Nouayti, Abderbi, et al. 2021). Borehole productivity can exceed 50 L/s in some zones, particularly in fractured areas.

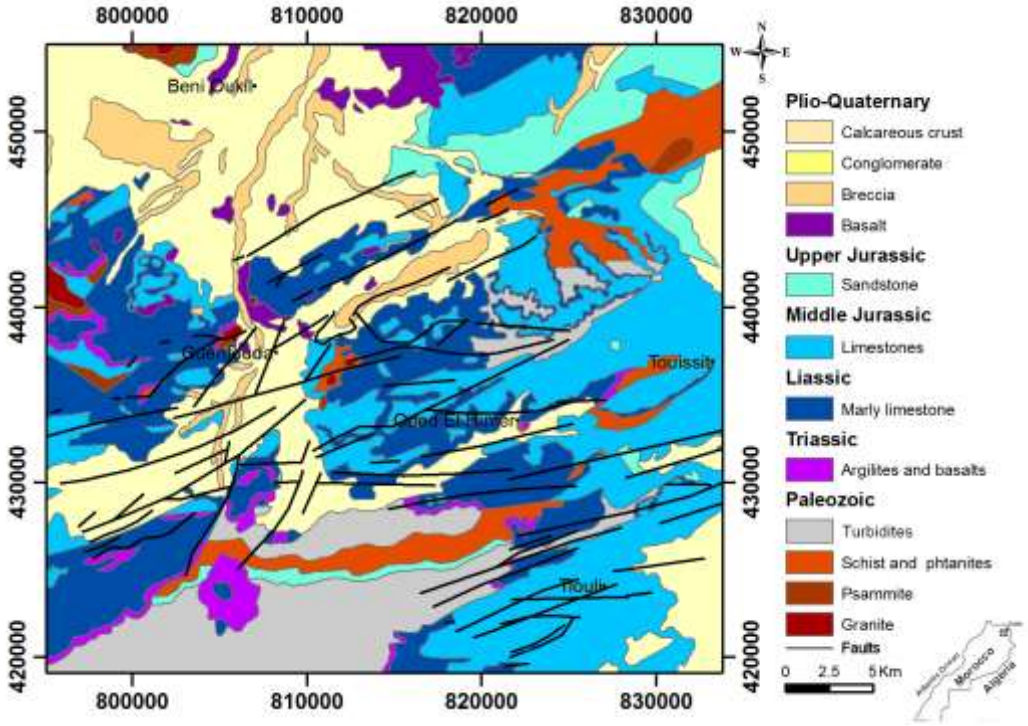

Fig. 1 Geological map with location of the Guenfouda region

MATERIALS AND METHODS

Groundwater samples were collected from 30 wells (Fig. 2) and analyzed by the ONEP (Office National de l'Eau Potable).

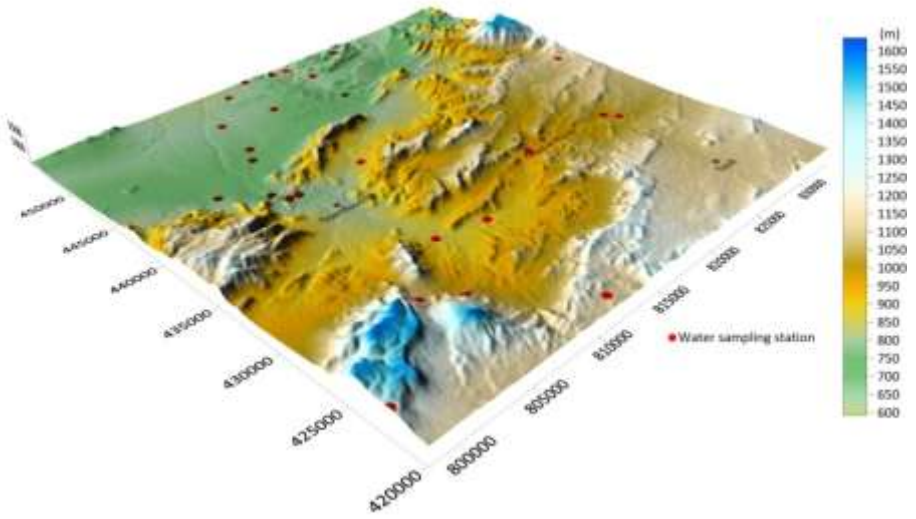

Fig. 2 Showing location of water sampling stations on digital elevation model

Irrigation indices such as Sodium Adsorption Ratio (SAR), Residual Sodium Carbonate (RSC), Sodium Percentage (%Na), Kelly Ratio (KR), Permeability Index (PI), and Total Hardness (TH) were used to determine the suitability of groundwater for irrigation.

SAR is utilized to predict the potential of Na^+ accumulation, initially in the soil through water transport at the expense of Ca^{2+} and Mg^{2+} following the regular use of sodic water. Its equation was formulated by Richards (1968)(Richards 1968). SAR also influences the water percolation

time in the soil. Therefore, it is desirable for the SAR value of irrigation water to be as low as possible.

The %Na is also used to classify water for irrigation purposes. Na^+ forms a chemical bond with the soil by displacing Ca^{2+} and Mg^{2+} ions, reducing water transport capacity(Ayers and Westcot 1985; Singh, Tewari, and Kumar 2020), and such soils become stiff when they dry out(Collins and Jenkins 1996; KG and AS 2020). Indeed, the reaction between Na^+ and CO_3^{2-} produces alkaline soils, while the reaction between Na^+ and chloride produces saline soils. Both types of sodic soils (alkaline/saline) inhibit crop growth(Hitti, MacPherson, and Lefsrud 2023; Todd and Mays 2004). %Na values were calculated by Richards (1968)(Richards 1968).

Kelly (1940)(Kelly 1940) introduced a factor to assess water quality and classification for irrigation based on the concentration of Na^+ compared to Ca^{2+} and Mg^{2+}. KR > 1 indicates an excessive level of Na^+ in the water.

The amount of excess carbonate and bicarbonate compared to alkali earth metal ions influences the suitability of groundwater for irrigation(Bokhari and Khan 1992; Fallatah and Khattab 2023). This excess is called Residual Sodium Carbonate (RSC), which was evaluated using the Eaton (1950)(Eaton 1950) equation.

The PI formula was developed by Doneen (1964)(Doneen 1964) to assess the water movement capacity in the soil as the suitability of any water source for irrigation, as soil permeability is influenced by the long-term use of irrigation water with a high salt concentration.

The United States Salinity Laboratory diagram(U.S.S.L. 1954) concerning the risk of salinity is used for evaluating the suitability of irrigation water quality, while the Wilcox diagram(Wilcox 1955) is a critical graphical method widely used to understand the combination of EC and SAR in evaluating water suitability for irrigation.

Water hardness results from the presence of divalent metal cations and can be calculated as the sum of the concentrations of Ca^{2+} and Mg^{2+} in meq/l equivalent to $CaCO_3$ (Liyanage et al. 2022; Todd and Mays 2004). Among the numerous interpolation methods available in the literature, we adopted the Kriging method because it is the best for standard distribution data(Belkhiri, Tiri, and Mouni 2020; Gharbia et al. 2016). This method involves three steps. Firstly, an exploratory data analysis is executed to explore data and verify their consistency and uniformity, by removing outliers and identifying the statistical distribution. Secondly, spatial correlation or dependence is quantified using semi-variograms.

The application of the Kriging approach with semi-variogram models is related to the expected quadratic difference between paired data values and the distance by which the locations have been separated (Taharin and Roslee 2021). Finally, the developed models are used for prediction. Thus, we reasoned on the best-fitted model for each index. The predictive performances of the fitted models were verified based on spatial cross-validation tests, namely: the mean (M), mean standardized (MS), root mean square (RMS), average standard error (ASE), and root mean square standardized (RMSS).

RESULTS AND DISCUSSION

I. Water quality indices

1. Sodium Adsorption Ratio (SAR)

Based on the SAR range, water samples can be classified into two categories: SAR < 10; (97% of samples) considered excellent, and SAR between 10 and 18; (3% of samples) considered good for irrigation.

2. Residual sodium carbonate (RSC)

RSC values in the study area range from -8.5 to 1.1meq.L-1. All groundwater samples fall within the safety limit for agriculture.

3. Sodium ratio (%Na)

The classification of water samples based on %Na is as follows: excellent (20%), good (47%), permissible (20%), and doubtful (13%). The majority of wells fall into the good category of water for irrigation.

4. Kelly Ratio (KR)

Based on the Kelly index, 83% of water points with KI ≤ 1 are recommended for irrigation, while 17% of water samples with KI ≥ 1 are not suitable for irrigation due to alkali risks(Ramesh and Elango 2012).

5. Permeability Index (PI)

According to Doneen (1964)(Doneen 1964), water samples are classified into two categories: class I (2%, suitable) and class II (98%, good), meaning that the sampled water is suitable for irrigation.

6. Total Hardness (TH)

The classification of water samples based on TH is soft (93%) and moderately hard (7%)(E.P.A. 1986), indicating that the analyzed water is suitable for irrigation.

The study's findings were consistent with those of papers on the hydrogeochemical analysis of groundwater samples from India(Singh, Tewari, and Kumar 2020) and Tunisia(Aouiti et al. 2021), which examined the suitability of groundwater for irrigation using irrigation indices.

II. Graphical interpretation of the USSL diagram and the Wilcox diagram

The % Na plotted against EC values for groundwater samples was depicted in the USSL diagram (Fig. 3), illustrating that, in general, most samples fall within a range from good to permissible, allowing appropriate water use for irrigation purposes.

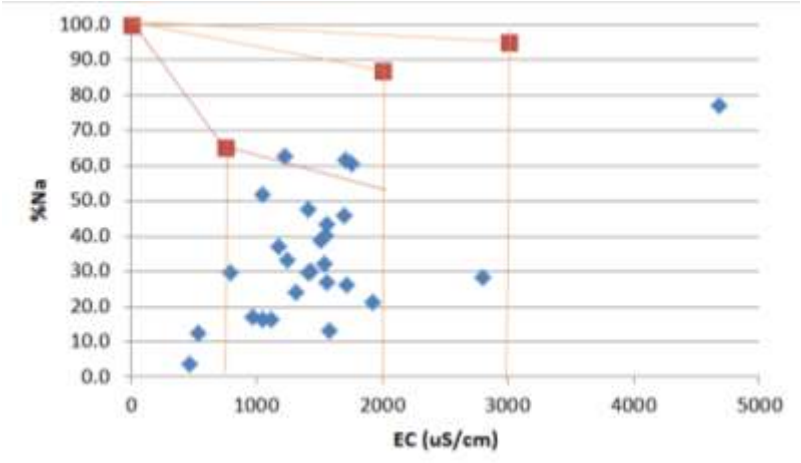

Fig. 3 USSL Diagram indicating the suitability of groundwater

Figure 4 displays groundwater samples falling within the C3S1 field, indicating moderate salinity control with low sodium risk and thus appearing suitable for irrigation use.

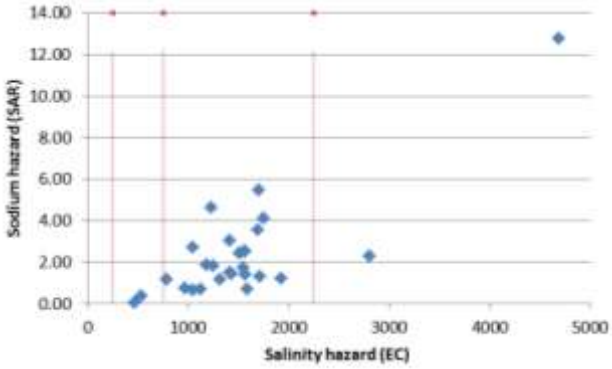

Fig. 4 Wilcox diagram indicating the suitability of groundwater for irrigation

III. Geostatistical modeling of irrigation indices

The predictions are unbiased, with "M" close to zero, indicating that our models are correct or even ideal when it is zero. However, this statistic is dependent on the data scale and insensitive to semivariogram inaccuracies. Therefore, we used "MS" to normalize "M", ideally aiming for it to be zero, confirming the accuracy of the proposed models.

Furthermore, each technique provides variances estimating the prediction variability from known kriging probability values. The RMS is slightly higher than the ASE, indicating that prediction errors were properly evaluated and prediction variability is underestimated. Underestimation of prediction variability is also inferred from the RMSS statistic, which is greater than one, the ideal value for this parameter. The corresponding sill, nugget, and range magnitudes for the best-fitted theoretical models were observed and reported in Table 1. The best-fitted semivariogram models are presented in figures 5 to 9.

Table 1 Characteristics parameters of semivariogram models

Parameter	Model type	Nugget	Sill	Variance	Lag size	Range	M	RMS	ASE	MS	RMSS
SAR	stable	0.1	5.3	2%	1205.0	9639.9	-0.3	2.6	1.4	-0.1	1.6
Na%	Stable	0.0	299.8	0%	2449.1	19592.4	-0.3	18.1	14.9	0.0	1.1
KR	Tetraspherical	0.1	0.5	18%	2424.0	19392.1	0.0	0.8	0.5	0.0	1.3
TH	Exponential	188.6	0.0	-	2411.6	19292.7	-0.1	14.5	14.3	0.0	1.0
PI	Stable	185.2	35.7	519%	3582.3	28658.7	-0.1	15.6	15.3	0.0	1.0

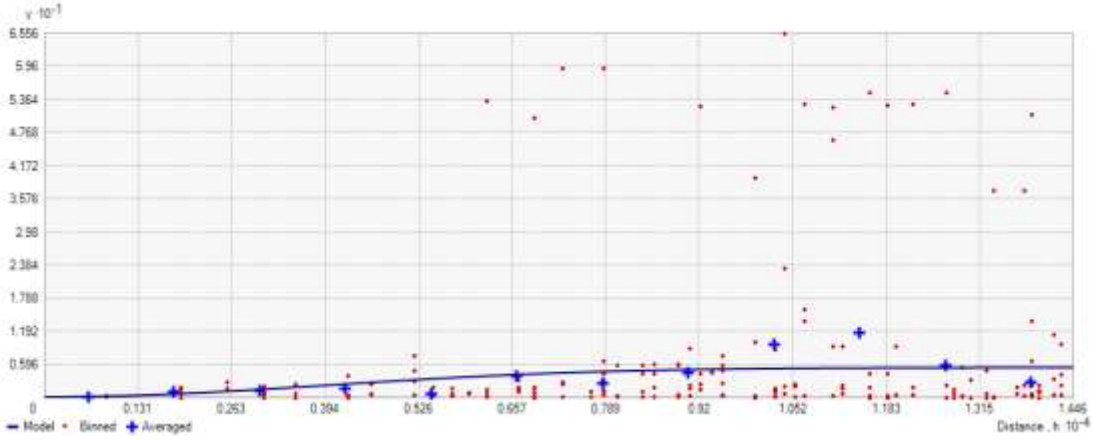

Fig. 5 Best-fitted semivariogram model for SAR indice

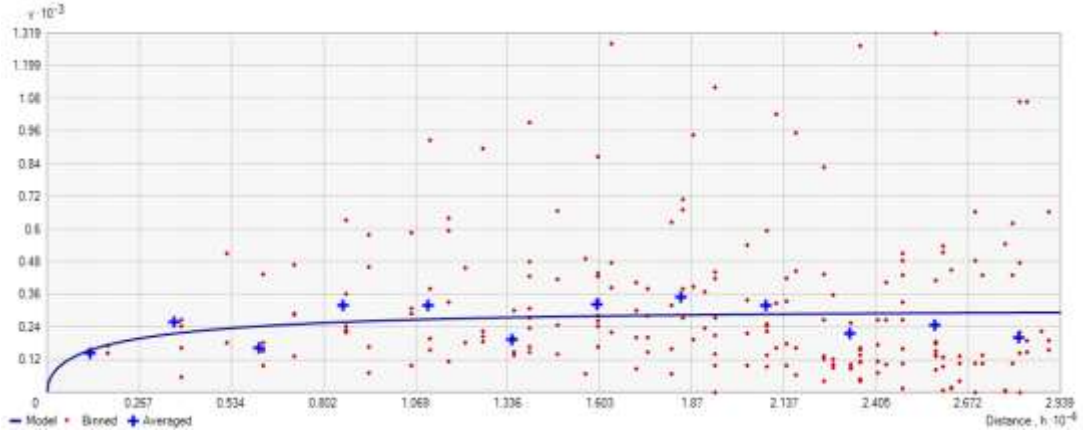

Fig. 6 Best-fitted semivariogram model for NA% indice

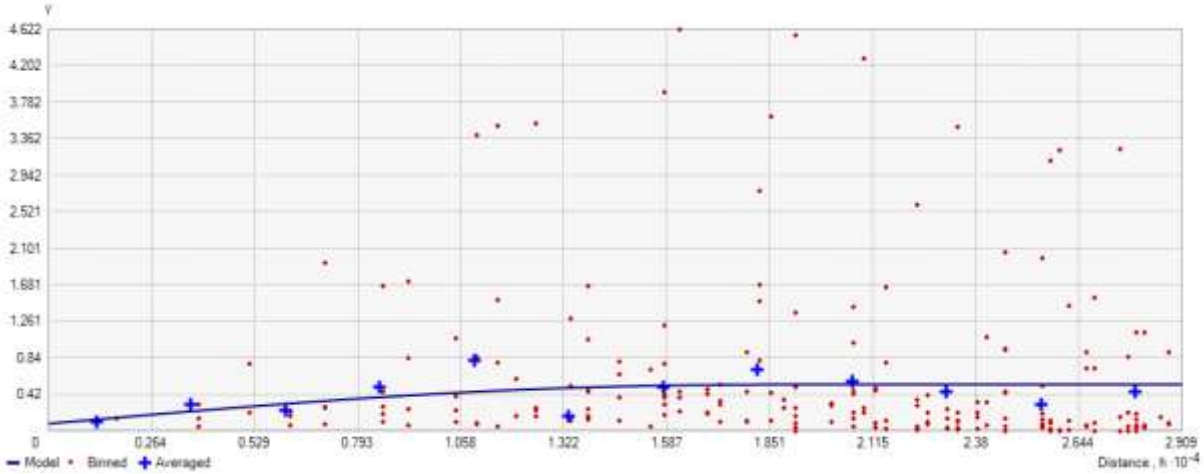

Fig. 7 Best-fitted semivariogram model for KR indice

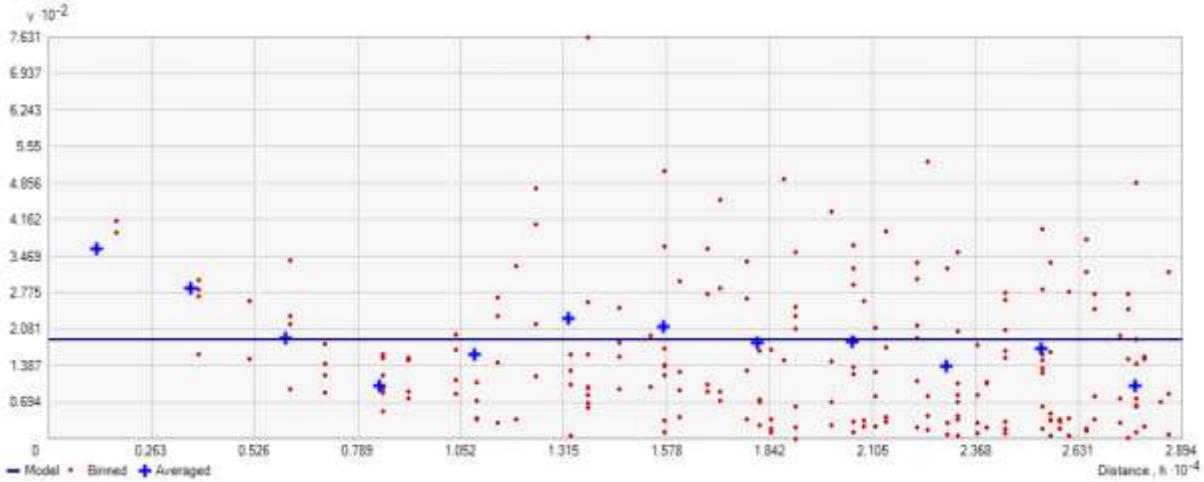

Fig. 8 Best-fitted semivariogram model for TH indice

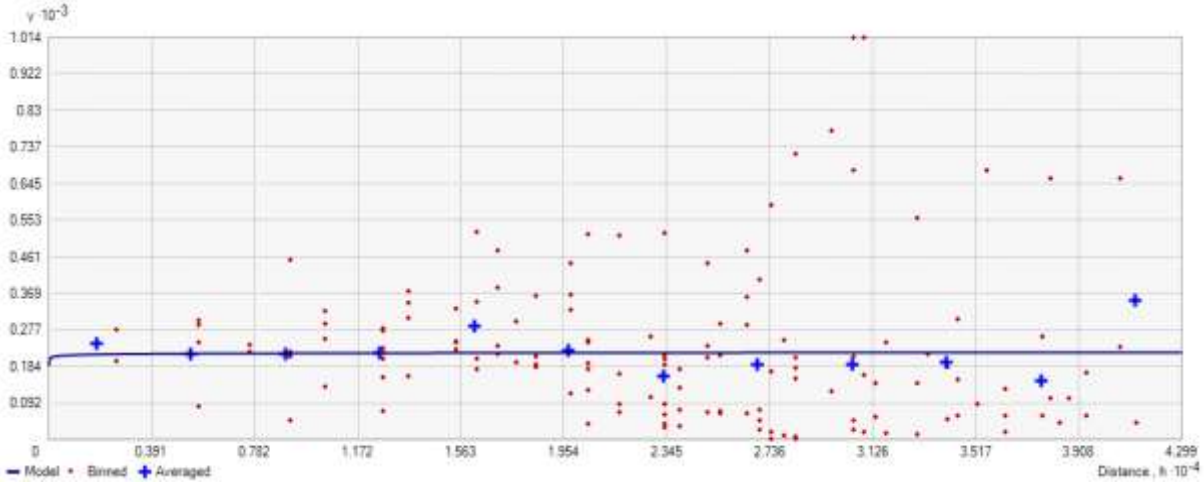

Fig. 9 Best-fitted semivariogram model for PI indice

The ratio of nugget variance to sill, expressed as a percentage, is used as a criterion for classifying the spatial dependence of irrigation factors. This ratio is less than 25% for SAR, %Na, and KR, indicating strong spatial dependence, while for PI, the rate is over 75%, signifying weak spatial support. All irrigation indices exhibit significant spatial structure and thus a good prediction model.

CONCLUSIONS

Agriculture constitutes the main source of income for a large number of people in the Guenfouda region. However, the region faces the adverse effects of excessive agricultural activities due to overexploitation of groundwater and alteration of its quality. This study provides essential information on groundwater quality for irrigation. Overall, all irrigation indices indicate that groundwater in the study area is suitable for agricultural activities. Furthermore, geostatistical analysis confirms that all parameters exhibit significant spatial structure, representing a good prediction model. This article demonstrates that hydrochemical characterization is an important tool for improving the understanding of groundwater quality. The findings of this study will assist policymakers in structuring and developing water resource management.

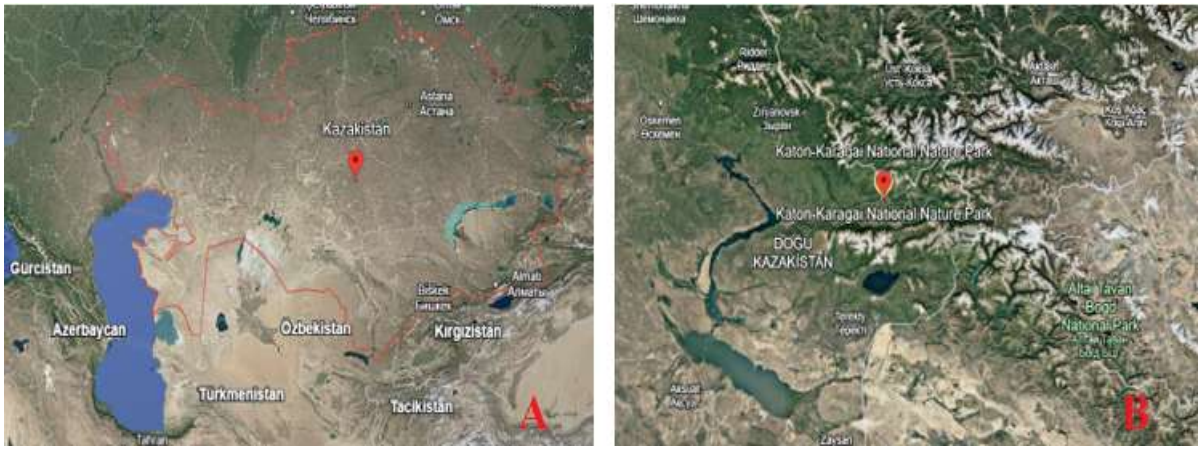
ÖZET

Bu çalışma, Kazakistan'ın en geniş korunan alanı ve UNESCO Dünya Mirası "Altay'ın Altın Dağları" bölgesinin bir parçası olan Katon-Karagay Milli Parkı'nın (KKMP) ekoturizm potansiyelini analiz etmektedir. Araştırmanın amacı, parkın sahip olduğu olağanüstü doğal ve kültürel miras değerleri ile mevcut yönetim, altyapı ve katılım eksiklikleri arasındaki uyumsuzluğu ortaya koymak ve sürdürülebilir bir ekoturizm modeli çerçevesinde çözüm önerileri geliştirmektir. Çalışmada sistematik literatür taraması ve SWOT analizi yöntemleri birlikte kullanılmış, parkın ekolojik bütünlüğü, sosyo-kültürel yapısı, yönetimsel kapasitesi ve turizm planlaması çok boyutlu olarak değerlendirilmiştir. Bulgular, Katon-Karagay'ın zengin biyolojik çeşitliliği, bozulmamış dağ ekosistemleri, endemik tür varlığı, kültürel özgünlük ve güçlü koruma statüsüyle önemli bir ekoturizm potansiyeline sahip olduğunu göstermektedir. Ancak, altyapı yetersizlikleri, kurumsal koordinasyon eksikliği, sınırlı yerel halk katılımı, tanıtım ve pazarlama konularındaki zayıflıklar bu potansiyelin sürdürülebilir biçimde değerlendirilememesine neden olmaktadır. Bu kapsamda çalışma, dört temel bileşenden oluşan bütünleşik bir ekoturizm gelişim modeli önermektedir: etkin yönetişim ve planlama, sürdürülebilir altyapı ve hizmetler, yerel kapasite geliştirme ve paydaş katılımı ile hedef odaklı pazarlama ve markalaşma. Sonuç olarak, Katon-Karagay Milli Parkı'nın uluslararası ölçekte tanınan sürdürülebilir bir ekoturizm destinasyonuna dönüşebilmesi, çevresel koruma ve yerel kalkınmayı dengeleyen uzun vadeli politikaların hayata geçirilmesiyle mümkündür.

Anahtar Kelimeler: Ekoturizm, Katon-Karagay Milli Parkı, Sürdürülebilir Turizm, Korunan Alan Yönetimi, Kazakistan, SWOT Analizi.

BARRIERS AND OPPORTUNITIES FOR ECOTOURISM POTENTIAL IN KAZAKHSTAN: THE CASE OF KATON-KARAGAY NATIONAL PARK

ABSTRACT



This study analyzes the ecotourism potential of Katon-Karagay National Park (KKNP), the largest protected area in Kazakhstan and part of the UNESCO World Heritage Site "Golden Mountains of Altai." The main objective is to identify the discrepancy between the park's outstanding natural and cultural values and the existing deficiencies in management, infrastructure, and local participation, while proposing solutions within the framework of sustainable ecotourism development. A systematic literature review and SWOT analysis were employed to assess the park's ecological integrity, socio-cultural dynamics, managerial capacity, and tourism planning dimensions. Findings indicate that KKNP possesses remarkable biodiversity, pristine mountain ecosystems, rich endemic flora and fauna, strong legal protection, and authentic cultural heritage, all of which represent significant ecotourism potential. However, weaknesses such as inadequate infrastructure, insufficient institutional coordination, limited community involvement, and weak promotion and marketing strategies hinder the effective realization of this potential. To overcome these challenges, the study proposes an integrated ecotourism development model consisting of four strategic components: effective governance and planning, sustainable infrastructure and visitor services, local capacity building and stakeholder participation, and targeted marketing and branding. In conclusion, transforming Katon-Karagay National Park into a globally recognized sustainable ecotourism destination depends on the implementation of long-term policies that balance environmental protection with local socio-economic development.

Keywords: Ecotourism, Katon-Karagay National Park, Sustainable Tourism, Protected Area Management, Kazakhstan, SWOT Analysis.

1. Giriş

Küresel turizm endüstrisi, iklim değişikliği, biyolojik çeşitlilik kaybı ve kaynakların aşırı tüketimi gibi çevresel sürdürülebilirlik endişelerinin artmasıyla birlikte, geleneksel kitlesel turizm modellerinden sürdürülebilir alternatiflere doğru yapısal bir dönüşüm yaşamaktadır. Bu bağlamda, çevresel korumayı, yerel toplulukların refahını ve ziyaretçi eğitimini temel ilke edinen ekoturizm, turizmin bu üçlü sacayağında denge kuran bir yaklaşım olarak giderek daha fazla önem kazanmaktadır (Fennell, 2020; Honey, 2008). Özellikle COVID-19 sonrası dönemde, doğa ile iç içe, kalabalıktan uzak ve anlamlı seyahat deneyimlerine yönelik artan talep, ekoturizmi sektörün en dinamik bileşenlerinden biri haline getirmiştir.

Orta Asya'nın en büyük ekonomisi ve coğrafyasına sahip olan Kazakistan, bozulmamış doğal alanları, geniş bozkırları, yüksek sıradağları ve zengin kültürel mirası ile önemli bir ekoturizm potansiyeli barındırmaktadır. Ancak, ülke ekonomisinde petrol ve doğalgaz sektörlerinin tarihsel ağırlığı, turizmin özellikle de ekoturizm alanındaki planlama, altyapı yatırımları ve yönetişim modellerinin yetersiz kalmasına neden olmuştur (Government of the Republic of Kazakhstan, 2019; OECD, 2018). Hükümetin son yıllarda ekonomiyi çeşitlendirmeye yönelik girişimleri ve "Yeşil Ekonomi" geçiş planına rağmen, korunan alanlardaki ekoturizm potansiyelinin etkin bir şekilde değerlendirildiğini söylemek güçtür.

Şekil 1. Kazakistan (A) ve Katon-Karagay Milli Parkı (B) uydu görüntüsü (Google Earth, 2025).

Kazakistan'ın (Şekil 1A) bu kullanılmamış potansiyelini simgeleyen en önemli noktalardan biri, ülkenin doğusunda, Rusya ve Çin sınırında yer alan Katon-Karagay Milli (Şekil 1B) Parkı'dır (KKMP). 2001 yılında kurulan ve 643.477 hektarlık alanı ile Kazakistan'ın en büyük milli parkı olan KKMP, aynı zamanda UNESCO'nun "Altay'ın Altın Dağları" (Şekil 2) Dünya Mirası Alanı'nın bir parçasıdır (UNESCO, 2014). Katon-Karagay Milli Parkı, park ve göllerinin (Şekil 3) yanı sıra Avrasya'nın simgesel türlerinden yılkı atları, kar geyiği, kar leoparı (*Panthera uncia*) ve Kara akbaba (Şekil 4 A-B-C-D) gibi nesli tehdit altındaki türlere ev sahipliği yapmaktadır. Aynı zamanda binlerce yıldır süren geleneksel Kazak ve Altay göçebe kültürünü yaşatan bir açık hava müzesi işlevi görmektedir (Kazakistan Cumhuriyeti Çevre, Jeoloji ve Doğal Kaynaklar Bakanlığı, 2021). Bu özellikleri, KKMP'yi yalnızca ulusal değil, küresel ölçekte de eşsiz kılmaktadır.

Şekil 2. Orman örtüsü, Alpin çayırları, kayalık yamaçlar, buzullar ve Belukha Dağı (URl, 1).

Şekil 3.Yazovoye Gölü (Yedi Göl) (URL, 2).

Parkın bu eşsiz özellikleri ve sahip olduğu muazzam potansiyeline karşılık, ciddi altyapı eksiklikleri (ulaşım, konaklama, atık yönetimi), yetersiz yönetim kapasitesi (personel, bütçe), yerel halkın sürece ekonomik ve karar alma düzeyinde dahil olamaması ve zayıf pazarlama stratejileri gibi eksiklikleri vardır. Bu sebeple parkın potansiyeli tam olarak değerlendirilememekte, adeta "saklı bir hazine" olarak kalmaktadır (IUCN, 2017; Turyspekova vd., 2022). Bu durum, turizmden beklenen ekonomik faydanın oluşmamasının yanı sıra, koruma hedefleri ile artan ziyaretçi sayısı arasında oluşabilecek çatışma riskini de beraberinde getirmektedir. Potansiyel ile mevcut durum arasındaki bu belirgin boşluk, bilimsel ve sistematik bir müdahaleyi zorunlu kılmaktadır.

Şekil 4. Yılkı atları (A), Kar geyiği (B) Kar leoparı (C) ve Kara akbaba (D). (URL, 3 ve 4).

Bu çalışma, işte bu boşluğu bilimsel olarak ortaya koymayı ve KKMP'nin sürdürülebilir, katılımcı ve ekonomik olarak canlı bir ekoturizm destinasyonuna dönüşmesi için entegre bir kalkınma modeli önermeyi amaçlamaktadır. Çalışma, mevcut durumu analiz etmenin ötesine geçerek, teori ile pratiği birleştiren ve politika yapıcılar için uygulanabilir bir yol haritası sunmayı hedeflemektedir. Bu kapsamda çalışmanın temel araştırma soruları şunlardır:

1. KKMP'nin mevcut durumu, ekoturizmin çevresel, sosyo-kültürel ve ekonomik sürdürülebilirlik ilkeleri açısından nasıl değerlendirilebilir?

2. Parkın bu potansiyelini sınırlayan içsel (zayıf yönler) ve dışsal (tehditler) faktörler nelerdir ve bu faktörler nasıl bir etkileşim içindedir?

3. Mevcut fırsatları değerlendirip zayıflıkları gidermek suretiyle, sürdürülebilir bir ekoturizm gelişimi için hangi stratejik, bütünleşik model ve politika önerileri geliştirilebilir?

Şekil 5. Geleneksel yurt (A) ve iç kısmı (B). (URL, 5)

2. Yöntem

Bu araştırma, nitel araştırma paradigması içerisinde sistematik literatür taramasına dayanmaktadır. Birincil veri toplama yerine, mevcut bilgi birikimini sentezlemeyi

ve kavramsal bir çerçeve oluşturmayı hedefleyen bu yöntem, erişimi kısıtlı bölgelerdeki konuların incelenmesi için uygundur.

Veri Toplama: Çalışmanın veri kaynaklarını, KKMP ve Kazakistan'da ekoturizm ile ilgili akademik makaleler, kitaplar, Kazakistan hükümeti ve uluslararası kuruluşlara (UNWTO, UNDP, IUCN) ait resmi raporlar ve istatistikler oluşturmuştur. Web of Science, Scopus ve Google Scholar gibi veri tabanlarında ilgili anahtar kelimelerle taramalar yapılmıştır.

Veri Analizi: Toplanan verilerin analizinde içerik analizi ve betimsel analiz yöntemleri kullanılmıştır. İçerik analizi ile metinler, önceden belirlenen temalar (yönetim, altyapı, yerel katılım vb.) çerçevesinde kodlanmış ve kategorilere ayrılmıştır. Betimsel analizle ise istatistiksel veriler özetlenmiş ve yorumlanmıştır. Analiz sürecinin merkezinde, parkın içsel ve dışsal faktörlerini organize bir şekilde değerlendirmeyi sağlayan SWOT analizi (Güçlü yönler, Zayıf yönler, Fırsatlar, Tehditler) bulunmaktadır.

3. Bulgular

3.1. Katon-Karagay Milli Parkı'nın Mevcut Durum Analizi

KKMP, ekoturizm ilkeleri açısından değerlendirildiğinde, potansiyel ile gerçeklik arasında belirgin ve endişe verici bir fark olduğu görülmektedir. Bu fark, sürdürülebilirliğin üç temel boyutunda da açıkça gözlemlenmektedir.

- **Çevresel Sürdürülebilirlik:** Park, UNESCO Dünya Mirası statüsü ve ulusal koruma yasalarıyla desteklenen güçlü bir yasal çerçeveye ve 900'ü aşkın vasküler bitki türü, 300'den fazla omurgalı türü (kar leoparı, boz ayı, Altay argali) ile olağanüstü bir biyolojik çeşitliliğe sahiptir. Bu, çevresel sürdürülebilirliğin temelini oluşturmaktadır. Ancak, bu potansiyel ciddi riskler altındadır. Etkin bir ziyaretçi yönetim sistemi ve bilimsel olarak belirlenmiş bir taşıma kapasitesi uygulamasının olmaması, hassas habitatlarda aşınmaya ve rahatsızlığa neden olmaktadır. Ayrıca, atık yönetimi sistemlerinin (özellikle plastik atıklar) yok denecek düzeyde olması, su kaynakları kirliliği ve görüntü kirliliği riskini beraberinde getirmektedir. İklim değişikliğinin etkisiyle eriyen buzullar ise uzun vadeli bir başka tehdit olarak kayıtlara geçmektedir.

- **Sosyo-Kültürel Sürdürülebilirlik:** Parkın en büyük avantajlarından biri, binlerce yıldır süren otantik Kazak ve Altay göçebe kültürünün parkta canlı bir şekilde yaşatılıyor olmasıdır. Geleneksel çadır konaklamaları (yurt), atlı göçer yaşam, şamanistik gelenekler ve el sanatları, ziyaretçiler için benzersiz bir kültürel deneyimi potansiyelini barındırmaktadır. Fakat, yerel halkın turizm gelirlerinden adil bir pay alamaması, turizmle ilişkili karar alma süreçlerine (örneğin, yönetim planlaması) dahil edilmemesi ve kültürel değerlerin ticarileşerek özünü kaybetme (örneğin, otantik olmayan gösteriler) riski, sosyo-kültürel sürdürülebilirliği ciddi şekilde zayıflatmaktadır. Yerel topluluklar ile park yönetimi arasında güven ve etkili iletişim eksikliği bulunmaktadır.

- **Ekonomik Sürdürülebilirlik:** Turizmden elde edilen gelir hem park yönetimi (yetersiz bütçe, ekipman eksikliği) hem de yerel halk (bölgede yüksek seyreden işsizlik oranları) için yetersiz kalmaktadır. Mevcut turizm ekonomisinin yapısı incelendiğinde, gelirin büyük kısmının bölge dışındaki tur operatörleri ve yatırımcılara aktığı görülmektedir. Konaklama ve yeme-içme tesisleri son derece sınırlı olup, çoğunlukla temel ihtiyaçları karşılamaktan uzak, düşük kapasiteli ve düşük gelir modeline sahiptir. Bu durum, ziyaretçi memnuniyetini, ortalama kalış süresini ve kişi başı harcamayı düşürmekte, dolayısıyla turizmin ekonomik katma değerini sınırlandırmaktadır.

3.2. SWOT Analizi

KKMP'nin mevcut durumunu stratejik bir perspektifle özetleyen ve geleceğe yönelik çıkarımlar yapmayı mümkün kılan SWOT analizi aşağıdaki tabloda detaylandırılmıştır (Tablo 1). Bu analiz, içsel ve dışsal faktörlerin kesişiminden doğan fırsatlar ve tehditleri net bir şekilde ortaya koymaktadır.

Tablo 1: Katon-Karagay Milli Parkı SWOT Analizi

	GÜÇLÜ YÖNLER (Strengths)	**ZAYIF YÖNLER (Weaknesses)**
İÇSEL FAKTÖRLER	S1. UNESCO Dünya Mirası statüsü ve güçlü koruma statüleri.	W1. Ulaşım, konaklama ve temel altyapının yetersiz ve kalitesiz olması.
	S2. Olağanüstü doğal güzellikler ve biyolojik çeşitlilik (kar leoparı, Belukha Dağı).	W2. Profesyonel turizm hizmeti (rehberlik, iletişim) ve insan kaynağı eksikliği.
	S3. Otantik ve canlı bir göçebe kültürel mirasın varlığı.	W3. Yetersiz bütçe, personel ve etkin bir yönetim planı eksikliği.
	S4. Geniş ve el değmemiş bir araziye sahip olması.	W4. Ziyaretçi yönetimi ve taşıma kapasitesi sistemlerinin olmaması.
		W5. Markalaşma, tanıtım ve pazarlama eksikliği.
	FIRSATLAR (Opportunities)	**TEHDİTLER (Threats)**
DIŞSAL FAKTÖRLER	O1. Artan küresel ilgi (ekoturizm, macera turizmi, yavaş seyahat).	T1. Plansız ve kontrolsüz turizm nedeniyle doğal ve kültürel kaynakların bozulma riski.
	O2. Kazakistan'ın turizmi çeşitlendirme ve ekonomiyi canlandırma stratejisi.	T2. İklim değişikliğinin ekosistemler ve buzullar üzerindeki olumsuz etkileri.
	O3. UNDP, IUCN gibi uluslararası kuruluşlardan teknik ve finansal destek potansiyeli.	T3. Yerel halk ile park yönetimi/ziyaretçiler arasında çıkar çatışmaları yaşanması.
	O4. "İpek Yolu" rotasının bir parçası olma potansiyeli.	T4. Yasa dışı avcılık, odun kesimi ve kaçak yapılaşma tehdidi.
	O5. Yerel halk için alternatif gelir kaynakları yaratma fırsatı.	T5. Bölgedeki diğer destinasyonlarla (Altay Cumhuriyeti) artan rekabet.

4. Tartışma: Entegre Bir Ekoturizm Gelişim Modeli Önerisi

SWOT analizinden elde edilen bulgular, KKMP'deki sorunların birbiriyle derinden bağlantılı ve sistemik olduğunu, dolayısıyla parçalı müdahalelerle çözülemeyeceğini açıkça göstermektedir. Zayıf bir altyapı (W1), etkisiz pazarlama (W5) ile birleştiğinde, olağanüstü doğal güzellikler (S2) ve kültürel mirasın (S3) varlığı bir anlam ifade etmemekte; aksine, kontrolsüz artan ziyaretçi sayısı (T1) bu değerleri tehdit eder hale gelmektedir. Bu nedenle, sorunları bir bütün olarak ele alan, sürdürülebilirliğin üç boyutunu da merkezine yerleştiren ve dört temel bileşenden oluşan entegre bir ekoturizm gelişim modeli önerilmektedir.

A. Yönetişim ve Planlama: Mevcut yönetim planının, tüm paydaşların (yerel halk, STK'lar, özel sektör) katılımıyla revize edilerek etkin ve şeffaf bir şekilde uygulanması esastır. Bu kapsamda:

- **Akıllı Ziyaretçi Yönetimi:** Parka girişler için çevrimiçi ön rezervasyon sistemi getirilmeli, farklı zonlar ve aktiviteler için taşıma kapasiteleri bilimsel olarak belirlenmeli ve

bu kapasitelere sıkı şekilde uyulmalıdır. Dinamik fiyatlandırma gibi araçlarla ziyaretçi akışı yönetilebilir.

- **Fonksiyonel ve Katılımcı Zonlama:** Park, "yoğun kullanım" (ziyaretçi merkezleri, temel tesisler), "hafif kullanım" (belirlenmiş doğa yürüyüşü parkurları), "vahşi yaşam koruma" (rehber eşliğinde, sınırlı giriş) ve "kültürel miras" zonlarına ayrılarak aktiviteler ve altyapı buna göre düzenlenmelidir.
- **Şeffaf ve Sürdürülebilir Koruma Fonu:** Giriş ücretleri, konaklama vergileri, bağışlar ve cezaların bir kısmı, parkın korunması, araştırma projeleri, izleme çalışmaları ve yerel kalkınma projeleri için ayrılan, şeffaf yönetilen özel bir fona aktarılmalıdır.

B. Altyapı ve Hizmet Geliştirme:

- **Sürdürülebilir Eko-Kulübeler ve Doğa Dostu Kamp Alanları:** Yerel mimariye uygun, yenilenebilir enerji (güneş panelleri, mikro hidroelektrik) kullanan, su tasarruflu arıtma sistemleri, kompost tuvalet ve etkin atık yönetimi olan, düşük kapasiteli ama yüksek konforlu konaklama tesisleri teşvik edilmelidir. İnşaatlarda yerel malzemeler kullanılmalıdır.
- **Yumuşak ve Sürdürülebilir Ulaşım:** Park içinde özel araç trafiği sınırlandırılarak, belirli noktalara elektrikli/minibüs servisleri veya geleneksel ulaşım yöntemleri (at, katır) kullanılmalıdır. Park girişlerine ve ana merkezlere bisiklet kiralama istasyonları kurulabilir.
- **Etkileşimli Ziyaretçi Merkezleri ve Açık Hava Müzeleri:** Parkın doğal ve kültürel değerleri, koruma önemi ve kuralları hakkında eğitim veren, dijital ekranlar, etkileşimli sergiler ve canlı demonstrasyonlar (el sanatları atölyeleri) içeren modern ziyaretçi merkezleri park girişlerine kurulmalıdır.

C. Yerel Katılım ve Ekonomik Fayda:

- **Ekoturizm Kooperatifleri ve Mikro-Kredi/Mentorluk Desteği:** Yerel halkın konaklama (ev pansiyonculuğu), rehberlik, atlı safari, geleneksel yemek, el sanatları satışı gibi hizmetleri sunabildiği, geliri adil bir şekilde paylaştığı kooperatifler kurulmalı ve bu girişimler mikro-krediler ve iş geliştirme mentorluğu ile desteklenmelidir.
- **Zorunlu Yerel Rehberlik ve Kapsamlı Kapasite Eğitimleri:** Hassas doğa ve kültür rotalarına girişlerde, eğitimden geçirilmiş ve sertifikalandırılmış yerel rehber kullanımı zorunlu hale getirilmelidir. Yerel halka turizm, girişimcilik, yabancı dil (İngilizce, Çince), ilk yardım, müşteri hizmetleri ve dijital okuryazarlık eğitimleri verilmelidir.
- **Yerel Tedarik Zinciri ve İstihdam Taahhüdü:** Parktaki tüm işletmelerin (otel, restoran, tur şirketleri) mümkün olduğunca yerel üreticilerden (çiftçiler, balıkçılar, el sanatçıları) tedarik yapması teşvik edilmeli ve park yönetimi ile büyük yatırımcılar, personel alımlarında yerel halka öncelik verme taahhüdünde bulunmalıdır.

D. Hedefli Pazarlama ve Markalaşma:

- **Niş ve Dijital Öncelikli Pazarlama:** Kitlesel turizm yerine, dağcılar, doğa fotoğrafçıları, kuş gözlemcileri, kültür araştırmacıları, macera arayan yüksek gelirli gezginler ve ailelere yönelik özelleştirilmiş pazarlama stratejileri geliştirilmelidir. Sosyal medya, seyahat blogları, influencer işbirlikleri ve SEO çalışmaları etkin kullanılmalıdır.
- **Dijital Hikaye Anlatımı ve Görsel İçerik Stratejisi:** Parkın UNESCO statüsü, "kar leoparının izinde" safari, göçebe kültürüyle iç içe yaşam, Belukha Dağı tırmanışı gibi benzersiz hikayeleri profesyonelce (yüksek kaliteli fotoğraf, drone çekimleri, belgesel tadında kısa

videolarla) anlatılmalı, uluslararası seyahat dergileri ve belgesel kanallarıyla işbirliği yapılmalıdır.

- **Sertifikasyon, Kalite Güvence ve İşbirlikleri:** Park ve parktaki işletmeler için uluslararası geçerli sürdürülebilir turizm sertifikaları (örneğin, GSTC kriterleri) alınması teşvik edilerek, ziyaretçilere kalite ve sürdürülebilirlik garantisi verilmeli, böylece pazarda farklılaşma sağlanmalıdır.

Bu modelin başarısı, yerel toplulukların, sivil toplum kuruluşlarının, özel sektörün ve ulusal düzeydeki karar vericilerin güçlü işbirliği, koordinasyon ve siyasi irade ile doğrudan ilişkilidir. Ulusal düzeyde bir "Korunan Alanlarda Ekoturizm Eylem Planı"nın hazırlanması ve uygulanması, yerel düzeyde ise sürekli kapasite geliştirme, izleme ve değerlendirme mekanizmalarının kurulması kritik öneme sahiptir.

5. Sonuç ve Öneriler

Bu çalışma, Katon-Karagay Milli Parkı'nın (KKMP) küresel standartlarda bir "ekoturizm destinasyonu" olma potansiyeli ile "altyapıdan yoksun, zayıf yönetişimli bir doğa turizmi noktası" olan mevcut durumu arasında kritik bir uçurum olduğunu ortaya koymuştur. Yapılan analizler, parkın UNESCO Dünya Mirası statüsü, olağanüstü biyolojik çeşitliliği ve canlı kültürel mirası gibi güçlü yönlerinin, yetersiz altyapı, sınırlı yerel katılım ve etkisiz pazarlama gibi zayıflıklar nedeniyle gölgelendiğini açıkça göstermektedir. Benzer şekilde, küresel ekoturizm talebi ve hükümetin turizmi çeşitlendirme çabaları gibi fırsatlar, kontrolsüz turizm baskısı ve iklim değişikliği gibi tehditlerle karşı karşıyadır. Bu nedenle, parkın sahip olduğu muazzam potansiyelin gerçek anlamda değerlendirilebilmesi, ancak zayıf yönlerin ve tehditlerin sistematik, koordineli ve kararlı bir şekilde ele alınmasıyla mümkün olabilecektir.

Önerilen dört ayaklı (Yönetişim ve Planlama, Altyapı ve Hizmet Geliştirme, Yerel Katılım ve Ekonomik Fayda, Hedefli Pazarlama ve Markalaşma) entegre ekoturizm modeli, bu zorlu dönüşüm için kapsamlı bir yol haritası ve stratejik bir çerçeve niteliğindedir. Bu modelin başarıyla uygulanması halinde, aşağıdaki somut çıktıların elde edilmesi beklenmektedir:

1. **Artırılmış Koruma Etkinliği:** Bilimsel zonlama ve akıllı ziyaretçi yönetimi sayesinde parkın ekolojik bütünlüğü ve biyolojik çeşitliliği korunacak, koruma-kullanma dengesi sağlanacaktır.
